CORK IN 1806.

(From "Carr's Stranger in Ireland.")

CORK FROM THE MARDYKE WALK IN 1806.

From Carr's "Stranger in Ireland.'

As we approached Cork the view became very fine, the river Lee winding to the Cove, a country on each side well cultivated, and dotted with villas: the city, its superb barracks, the Mardyke Walk, extending a mile under the shade of elms, the New Gaol, which has a noble appearance, and the shipping, presented an uncommonly rich, varied, and picturesque prospect. Cork is the second city in Ireland, and if ships of above two hundred tons were not obliged to unload at Passage, five miles and a half from Cork, it would be one of the finest port towns in the world. In times of peace the flags of every nation may be seen waving in her harbour, called the Cove, now protected by a fort, built on the great island below, commanding the haven, which is perfectly safe, and capable of affording complete protection to the whole navy of England from every wind that blows. Ships from England, bound to all parts of the West Indies, put in here; and in one year, in pacific times, no less than two thousand vessels have floated upon its bosom.

In the city are three convents; two of the order of the Presentation, devoted entirely to the instruction of poor female children, and one called the Ursuline, for the education of females in the higher ranks of life, but in which poor children are also sometimes instructed.

The barracks are upon an immense scale, and very superb: they stand upon a rocky mountain, and command the city, and all the beautiful scenery of the surrounding country. The city stands upon several islands formed by the river Lee, which are handsomely banked and quayed in. Several streets have been gained from the river, and are built like the Adelphi, upon arches: the shops are well supplied, and many of them are elegant. The Mardyke Walk is very beautiful: from this spot I made a sketch of the city. It has many very handsome houses, and the society is refined and elegant.

In the centre of the parade, which is very spacious, there is an equestrian statue of George the Second; it is of stone, and painted yellow, and has nothing belonging to it worthy of further notice.

I saw a review of the military quartered in and near the city here, and never beheld finer men. An English officer of rank and family, who distinguished himself at the battle of Arklow, informed me, what candour induces me not to suppress, that on a march the native troops of Ireland have frequently preceded the English by one mile in four miles.

The poor of this city are very numerous, and bear a dreadful proportion to the population; but this excess is met by an increased active and provident spirit of charity. Yet although there are many beneficent institutions, they are not adequate to shelter and support the many distressed objects of every province who flock to the city for relief.

The inhabitants of this, like those of every other city, are disposed to exaggerate its population, which they estimate at nearly one hundred and twenty thousand; but most of the Roman Catholic clergymen, and the resident physicians who have the best means of information, average it at one hundred thousand: the mode usually adopted of grounding the calculation upon the number of houses, is very fallacious, not only with respect to this, but every other city in the southern and western provinces, and generally throughout Ireland, where the poorer classes are compressed into a space which is shocking to humanity: in several lanes in Cork, the walls of a small, wretched habitation, frequently enclose upwards of fifty persons. Limerick, and I am told Galway, exhibit similar instances of crowded population, and hence have arisen the gross errors of those who have formed their estimate of population upon the returns of the hearth-money and tax-gatherers.

The population of Cork has increased five-fold since the reign of Charles the Second, and has received, notwithstanding the counteractive effects of war, and the decline of manufactures in the south, an augmentation of at least ten thousand inhabitants within the space of ten years.

A Frenchman, with much vivacity in his enthusiastic admiration of porter, called it "La Creme de Londres." As the substition of this wholesome beverage for spirituous liquors, is of so much consequence to the political and moral prosperity of Ireland; and as the greatest and best quantity of Irish porter is brewed at Cork, the porter breweries there formed one of the earliest objects of my enquiry: there are four principal porter breweries, viz., Messrs. Beamish and Crawford's, Messrs. George and Andrew Drinan's, the River Lee Porter Brewery, under the firm of Leslie and Co., and Messrs. Gibbons and Carroll; there are also one or two inferior porter breweries: the principal ale breweries belong to Messrs. Reilly and Hadigan, and Cashman and Sons.

Cork exports more beef, tallow, hides, butter, fish, and other provisions than Belfast, Waterford, or Limerick; her other exports are linen cloth, pork, calves, lambs, rabbit-skins, wool for England, linen, and woolen yarn and worsted. The slaughtering season commences in September, and continues to the latte rend of January, during which time it has been computed that no less than one hundred thousand head of black cattle have been killed and cured.

The market for fish, meat, and vegetables is admirably constructed and profusely supplied. The Irish excel us in the architectural arrangements of these buiidlngs. Provisions were as under: the best beef and mutton at 4d. per lb.; a couple of ducks, one shilling; a turkey, half-a-crown; and a hare, sixpence. In the shambles I met the mayor, distinguished by a cocked hat and golden chain, actively engaged in preventing frauds, and preserving order. For the support of this office, five hundred pounds per annum is appropriated out of the city revenues, amounting annually to three thousand pounds. The civil government of the city is vested in this magistrate, a recorder, and sheriffs. Cork is also the see of a bishop, who has a palace here. There is a small, neat theatre, but there were no performers when I was in the city. At the great cattle-fairs, no woman with a red cloak is permitted to appear; a regulation which arose from the following very extraordinary circumstance, which a gentleman of great respectability assured me was true. At a great cattle fair in this county, a herd of oxen was so frightened by the red cloak of an old woman, that they ran off with the greatest fury and descended a slope of ground with such velocity as to break down part of the park wall of a nobleman.

WHEN BESSIE COMES TO THE SPRING.

The daisies nod merrily one to another,
The marigolds cling to the hem of her gown,
The chickens desert their excitable mother
To clamour for favours when Bessie comes down
With her pail to the spring. Oh, red and white roses,
No fairer are they all a-bloom in the grass
Than the bloom of her cheeks; see how graceful she poses
To watch the cloud shadows that lazily pass,
While birds linger praiseful on fluttering wing
When hazel-eyed Bessie comes down to the spring.

The rabbit peeps shyly from out his sweet cover
Of thick blossomed lilacs adorning the slope,
To gaze with the eloquent eyes of a lover
Where Bessie comes tripping like radiant Hope
From the dream of a poet, her lose-flowing tresses
With arrows of sunlight shot many times thro'—
And Brindle comes lowing to meet her caresses,
The grass showing dark where she scatters the dew,
And backward and forward complacently swing
The winnows when Bessie comes down to the spring.

Her charms owe no tax to the law of cold fashion,
She had all her grace from the glorified One,
And her veins are as free of the latter-day passion
As meadow-stream kissed by the beams of the sun.
From scene-painted grotto no fairies beguile her
In opera fashioned to mountebank's art,
But she hears the lark's melody ripple ecstatic
And full from his throat whereon lieth his heart.
Then up through the meadow with giant-like swing
Comes Reuben to welcome sweet Bess at the spring.

DONAGH MAC NAMARA HARNESSING FOR BATTLE.

A.D. 1309.

(FROM THE ARCHAEOLOGICAL TRACTS.*)

After that harangue of Donagh to his brave people, he arose on the spot with courage and activity, to clothe himself in shining armour. His noble garment was first brought to him, viz.: a strong, well-formed, close-ridged, defensively-furrowed, terrific, neat-bordered, new-made, and scarlet-red cassock of fidelity; he expertly put on that gold-bordered garment (or cotun), which covered him as far as from the lower part of his soft, fine, red-white neck, to the upper part of his expert, snow-white, round-knotted knee.

Over that mantle he put on a full-strong, white-topped, wide-round, gold-bordered, straight, and parti-coloured coat of mail, well-fitting, and ornamented with many curious devices of exquisite workmanship. He put on a beautiful, narrow, thick, and saffron-coloured belt of war, embellished with clasps and buckles, set with precious stones, and hung with golden tassels; to this belt was hung his active and trusty lance, regularly cased in a tubic sheath, but that it was somewhat greater in height than the height of the sheath; he squeezed the brilliant, gilt, and starry belt about the coat of mail; and a long, blue-edged, bright-steeled, sharp-pointed, broad-sided, active, white-backed, half-polished, monstrous, smooth-bladed, small-thick, and well-fashioned dagger was fixed in the tie of that embroidered and parti-coloured belt; a white-embroidered, full-wide, strong, and well-wove hood was put on him over his golden mail; he himself laid on his head a strong-cased, spherical-towering, polished-shining, branch-engraved, long-enduring helmet; he took his edged, smooth-bladed, letter-graved, destructive, sharp-pointed, fight-taming, sheathed, gold-guarded and girded sword which he tied fast in haste to his side; he took his expect, keen-pointed, blue-coloured, and neat-engraved dart in his active right hand, in order to cast it at the valiant troops, his enemies; and last, he took his vast-clubbed, strong-eyed, straight-larced, fierce-smoking, and usual spear in his left, pushing and smiting therewith.

Great was the tumult of the army then, seeking for their purple-branched cassocks, brilliant mails, blazing swords, and spears of ample circumference, restraining their steeds backward by the reins, as not obedient to the guidance of their riders, choosing their arms, the young adhering, for their beauty, to the golden arms, and the old aiming at the ancient arms, with which they often before acted great deeds in battle—the soldiers closely sewing their ensigns to their vast poles, and fastening their colours by the borders to the lofty poles of their spears.

*A specimen of the inflated style introduced into Irish literature in the ninth or tenth century, and probably borrowed from the East. We have no direct proof that the Irish were acquainted with Oriental literature at so early a period; however, the fragments preserved of Irish composition of an earlier date are remarkable for simplicity. (From the Battle of Magh Ratagh, translated by John O'Donovan, Esq).

Mr. A. G. Webster reported to the American Physical Society in New York recently the results of experiments on a single difference in the audibility of sound when passing over water and over grass. Under similar conditions of quietness it was found that a given sound could be heard almost exactly four times as far over water as over grass. The assumption that water is a perfect reflector, and grass a complete absorber of sound-waves is not, Mr. Webster says, sufficient to explain the phenomenon. The practical importance of knowing this peculiarity, where sound may have to be sent across a grassy plain, is evident.

THIRTY HISTORIC IRISH-AMERICAN FAMILIES.

A BRILLIANT RECORD.

THE Irish chapter in American history is one of interest to all Irishmen: be their political school of thought what it may, they cannot but feel pride in the men of their race who in another country won distinction in the various walks of life No more typical Americans exist than those of Irish extraction. No purer stream of patriotic influence permeates the nation than that proceeding from an Irish fountain-head. The history of the Irish element in the United States is not yet written. Fragmentary productions, illustrating some epoch or condition, have appeared at frequent intervals. These have served to give an approximate idea of the glorious whole. In that manner, therefore, and to that extent, they have discharged their purpose well.

My object in this paper is to contribute another fragment to the general data. I have, therefore, selected as a topic, "Thirty Historic American Families." These families, it should be stated, are all of Irish ancestry. A few of them have become extinct, but their unselfish devotion to the republic is a part of their country's glory. Many of the others still continue to send forth heroes, three or four generations from the parent stem. In tracing the history of American families, how frequently it appears that "The first of the family was an Irish exile," or "His grandfather belonged to the United Irishmen," or "Both his parents were Irish." This, however, is not particularly surprising, when we remember that over twenty million of the American people are of Irish birth or descent.

The accompanying sketches are necessarily brief. They are, however, believed to be sufficiently detailed to convey a fair illustration of the subject. This list does not, by any means, exhaust the material at hand. One hundred other families of Irish blood, in addition to those here given, and of equal prominence, could easily be described. Without further preface, the thirty families are thus summarised:—

THE BURKES, of Virginia.
THE BURKES, of North Carolina.
THE BURKES, of South Carolina.
THE BUTLERS, of Pennsylvania.
THE CALHOUNS, of South Carolina.
THE CAMPBELLS, of Virginia.
THE CAREYS, of Pennsylvania.
THE CARROLLS, of Maryland.
THE CLINTONS, of New York.
THE EMMETS, of New York.
THE FITZGERALDS, of Pennsylvania.
THE JACKSONS, of North Carolina.
THE KEARNEYS, of New Jersey.
THE KEATINGS, of Pennsylvania.
THE KELLYS, of Pennsylvania.
THE LYNCHES, of North Carolina.
THE McKEANS, of Delaware.
THE McKEONS, of New York.
THE McNEVINS, of New York.
THE MEADES, of Pennsylvania.
THE MOORES, of South Carolina.
THE MOYLANS, of Pennsylvania.
THE NIXONS, of Pennsylvania.
THE O'BRIENS, of Maine.
THE O'FALLONS, of Missouri.
THE PORTERS, of Pennsylvania.
THE ROUTLEDGES, of South Carolina.
THE SULLIVANS, of Maine.
THE THOMSONS, of Pennsylvania.
THE THORNTONS, of New Hampshire.

The first family I will take up is so well known that but few words are necessary. I allude to

THE CARROLLS, OF MARYLAND.

One of the first of the family emigrated from Ireland over two hundred years ago. He had a son, Charles. This second Charles's son was the signer of the Declaration of Independence. The third Charles had a cousin, John, who was sent by Congress on a mission to Canada, and who subsequently became Archbishop of Baltimore. The fourth Charles was a son of the signer, and rendered patriotic service to the republic. The fifth Charles was a grandson of the signer, and became Governor of Maryland. Daniel Carroll, cousin of Charles Carroll of Carrollton, was a delegate to the convention that framed the United States constitution, and was afterward a member of Congress.

THE O'BRIENS, OF MAINE.

Maurice O'Brien came from Cork, Ireland, long before the Revolution. He settled at Machias, Maine. He had five sons, of whom the most famous were Jeremiah, John, and William. They were all sailors, hardy, fearless, and intrepid. They won the first naval fight of the Revolution, and received the thanks of Congress therefor. All three were rapidly promoted. They were desperate combatants, and braver naval officers never trod a deck.

THE SULLIVANS, OF MAINE.

I give Maine the credit of this notable family, although New Hampshire and Massachusetts have an almost equal right to the honour. Owen Sullivan emigrated from Limerick, Ireland, where he was born, during the siege of 1691. He was a lineal descendant of Dermod, chief of Beare and Bantry, and left Ireland in 1723, locating at Berwick, Me. His two sons, John and James, were ardent patriots. John was born at Berwick in 1740, and James four years later, at the same place. Upon the appointment of Washington as commander-in-chief, John Sullivan was commissioned brigadier-general, and assigned to the siege of Boston. On the evacuation of the city, Sullivan participated in the triumphal entry of the American troops, and afterward rendered valiant service throughout the war, finally becoming a major-general. After resigning his commission, he was chosen governor of New Hampshire. His brother, James, became governor of Massachusetts, and discharged the duties of the position so satisfactorily that he was re-elected.

John's son, George, was graduated at Harvard, became attorney-general of New Hampshire, and was elected to Congress. James' son, William, was born in Saco, Me., in 1774, was graduated at Harvard, and became a brigadier-general of militia. James had another son, John Langdon Sullivan, who was born in Saco, and became an intimate friend of President Monroe. William's son, John Turner Sargent Sullivan, was born in Boston in 1813, and was a prominent lawyer. John Langdon Sullivan had a son, Thomas Russell Sullivan, who was born in Brookline, Mass., in 1799, and was graduated at Harvard.

THE THORNTONS, OF NEW HAMPSHIRE.

James Thornton left Ireland previous to the Revolution. Mathew Thornton, his son, was but two or three years of age at the time of his father's arrival in America. Matthew studied medicine. He became President of the New Hampshire Provincial Congress, and was one of the signers of the Declaration of Independence. He was also chief justice of the court of common pleas, judge of the superior court of New Hampshire, and was a delegate to the Continental Congress. In 1887, the state of New Hampshire erected a monument in his honour.

THE CLINTONS, OF NEW YORK.

Charles Clinton was born in Longford, Ireland, in 1690. He landed on Cape Cod in 1729, and soon after settled in Ulster county, New York. One of his sons became a physician. Three other sons, Charles, James, and George, became soldiers. James was appointed colonel, accompanied Gen. Montgomery to Quebec, and was afterward commisioned brigadier-general. George was a member of the second Continental Congress. Washington appointed him general of militia, and assigned him to an important post in the Highlands of the Hudson. In 1777 he was made a brigadier-general in the Continental army. He was chosen governor of New York, and was re-elected. George's son, De Witt Clinton, was an eminent lawyer, became United States senator, and was elected mayor of New York city. President John Quincy Adams offered him the position of minister to England, but he did not accept it. James Clinton's grandson, Alexander, was a physician and an officer in the war of 1812.

THE EMMETS, OF NEW YORK.

Thomas Addis Emmet was born in Cork, in 1764, and was an elder brother of the heroic Robert Emmet. Thomas was a member of the United Irishmen. He was arrested by the British government, and confined in Fort George, Scotland. Afterward he was given permission to go to France with his wife, and was forbidden ever to return to Ireland. After a short period, he came to New York and settled

there. In 1812 he became attorney-general of the state. His son, Robert was also born in Ireland. He became a lawyer of great ability, and was made a judge of the superior court of New York. He died in New York. John Patton Emmet, a second son of Thomas, was born in Ireland in 1797, and became an eminent chemist. He settled in New York, and was at the United States Military Academy in 1814-17. Subsequently he studied medicine, and located in Charleston, S.C. He was at one time professor of chemistry and natural history in the University of Virginia. Thomas had a third son, Thomas Addis Emmet, Jr., who was likewise born in Ireland, and became an able lawyer in New York city. He died at Astoria, L.I., in 1863. Robert's son, another Thomas Addis Emmet, was a native of New York, where he was born in 1818. He was one of the twelve founders of the American Society of Civil Engineers. John Patton Emmet's son, Thomas A., was a native and prominent physician of Virginia. He was also located in New York city. Robert's grandson, Robert Temple Emmet, was born in New York city in 1854. He was graduated from West Point, and was attached to the Ninth Cavalry, U.S.A., rendering effective service agianst the aggressive Apache Indians. His twin sister, Rosina, has taken many prizes for art work, and is a member of the Society of American Artists.

THE McNEVINS, OF NEW YORK.

William J. McNevin was a native of Galway, Ireland. He was educated in Vienna, where his uncle was physician to the Empress Maria Theresa. William returned to Dublin in 1783, became a physician of extensive practice, and affiliated with the United Irishmen. He was arrested with Robert Emmet, and upon being released, in 1802, came to New York in company with Thomas Addis Emmet. He wrote many valuable works on patriotic, political, and medical subjects. He created a large practice in the land of his adoption, and was universally esteemed, together with other members of his family.

THE McKEONS, OF NEW YORK.

Captain James McKeon, of New York, a gallant Irish officer, participated in America's second war with England, and rendered especially notable service at the battles of Fort George, Chippewa, and Fort Erie. His son, Hon. John McKeon, was elected to Congress in 1835; was District Attorney of the county of New York, and later became United States District Attorney for the southern district of New York.

THE KEARNEYS, OF NEW JERSEY.

The first of the family left Ireland in 1716, and located in Monmouth county, N.J. He had a son, Philip. Philip's grandson, Stephen W. Kearney, was a famous general. Stephen's cousin, Lawrence Kearney, was born in Perth Amboy, N.J., and became a commodore in the navy. Stephen W., above mentioned, took part in the war of 1812. At the battle of Queenstown Heights, although he was then but a mere boy, he successfully charged an English battery, and was promoted for the deed. He subsequently became a major-general, and participated in the war with Mexico. In 1847 he was made governor of California. His nephew, Gen. Philip Kearney, was a cavalry commander in the Mexican war, and was in many battles, including Contreras and Churubusco. He lost an arm in one engagement. He also rendered gallant service during the Civil War, and "Dashing Phil Kearney" became proverbial throughout the army.

THE NIXONS, OF PENNSYLVANIA.

Col. John Nixon, the grandson of an Irish exile, was the first to read the Declaration of Independence to the people. He was a member of the Friendly Sons of St. Patrick, of Philadelphia, and subscribed twenty-five thousand dollars in aid of the American cause. His son, Henry, was fourth president of the Bank of North America.

THE MEADES, OF PENNSYLVANIA.

George Meade, a native of Philadelphia, was of Irish descent. He was born in 1741. He was one of the earliest members of the Friendly Sons of St. Patrick, was a signer of the Declaration of Independence, and took an active part in supplying funds for the Continental army. His son, Richard W., became a merchant and ship-owner. Richard's son, George Gordon Meade, after graduating from West Point, was assigned to the Third Artillery. He rendered able services in the Civil War, and at length rose to the command of the army of the Potomac. Richard had another son, Richard W., who became a famous naval officer, and retired with the rank of commodore. The second Richard's son, also named Richard, likewise distinguished himself in the navy during the Civil War. Gen. George G. Meade's son, George, was a dashing cavalry commander.

THE MOYLANS, OF PENNSYLVANIA.

Stephen, Jasper, and John Moylan. These three rendered vast service to the cause of American independence. They were brothers of Rt. Rev. Bishop Moylan, of Cork, Ireland. Stephen joined the Continental army at the siege of Boston. In 1776, Washington appointed him an aide-de-camp on his staff. In the same year he was, on the recommendation of Washington, commissioned by Congress as quartermaster-general. He subsequently raised the first Pennsylvania regiment of cavalry, and was at Valley Forge in the winter of 1777 and 1778. In 1779 he was on the Hudson, and later in Connecticut. Before his retirement at the close of the war, he was made a brigadier-general. Jasper was a lawyer at Philadelphia, and a true patriot. John was United States clothier-general during the Revolution.

THE FITZGERALDS, OF PENNSYLVANIA.

"Col. Fitzgerald," says George Washington Parke Custis, "was an Irish officer in the old Blue and Buffs, the first volunteer company raised in the South in the dawn of the Revolution, and commanded by Washington." In the campaign of 1778 he was appointed aide-de-camp to Washington. Thomas Fitzgerald, his son, was born at Germantown, Penn., in 1796, and gallantly served under Gen. Harrison in the second war with England. He became a lawyer of note, and removed to Indiana, and subsequently to Michigan. He was a regent of the university in the latter state, and became a United States Senator. President Pierce appointed him judge of one of the territories, but the appointment was declined. Afterwards he became a judge of probate in Michigan.

THE KELLYS, OF PENNSYLVANIA.

The elder Kelly, an Irish exile, located in Philadelphia at an early period, became a successful merchant, and was an ardent patriot. He died in 1825, leaving three sons, John, William, and Robert. John died in 1837. William and Robert continued their father's extensive business. One of them became President of the State Agricultural Society, a trustee of Vassar College, and state senator.

THE CAREYS, OF PENNSYLVANIA.

Matthew Carey was born in Ireland in 1760, and was of sterling patriotism. He emigrated to America, and in 1819 published his "Vindiciæ" in refutation of slanders against the Irish nation. His son, Henry Charles Carey, was a native of Philadelphia, and was born in 1793.

(To be Concluded next week.)

THE SISTER.

With downcast eyes she threads the busy street,
On mission bent, from which she seldom swerves;
No law of simple creed impels her feet,
But love of Him, the Master, whom she serves.

No mother she, but with a mother's love
For homeless waifs beneath her tender care,
Her gentle hand falls, softly as a dove,
On heads, and rests in benediction there.

On duty's altar, low, her heart is laid,
She leaves to Him she serves a fitting price,
And He will see that she is nobly paid—
This gentle one who offers sacrifice.

She sinks to rest, when bells at even toll,
The world all heedless of her noble part;
They little knew that pure and lovely soul
The holy impulse which upheld her heart.

She lies, a saint-like image, cold and dead,
While incense sweet perfumes the holy air,
Oh, place no wreath of glory on her head!
Can you not see—a halo now is there?

RACHAEL SEVERNE.

In Brussels, Malines, and other Belgian towns a novel method of not only getting rid of smoke, but turning it into use, has recently been employed. The smoke is driven by a ventilating fan into a filter filled with porous material, over which a continuous stream of petroleum, benzine, alcohol, or some liquid hydrocarbon flows. The result is that the smoke is entirely suppressed, while the filter yields a gas of great calorific power, which can be used for heating purposes and for driving gas-engines. The filtering material itself also becomes a good combustible.

Ancient Boroughs of Ireland

(From Lewis's "Topographical Dictionary of Ireland, 1837.)

Arms.

ARDFERT, a decayed borough and market-town, and a parish, in the barony of Clanmorris, county of Kerry, and province of Munster, 5 miles (N.N.W.) from Tralee, and 144½ (S. W. by W.) from Dublin; containing 3585 inhabitants, of which number 717 are in the town. The name of this place, sometimes written ARDART, signifies, according to Sir James Ware, "a wonderful place on an eminence," or, as some interpret it, "the hill of miracles." ARDART has also been considered a corruption of ARD ERT, "the high place of Ert." Mathew Paris calls it HERTFERT, "the place of miracles of Hert or Ert"; and in the Annals of Innisfallen it is mentioned under the name of HYFERTE, which denotes "the territory of miracles, or of Ert." It is thought to have been made by St. Ert, in the fifth century, the seat of a bishop's see, which comprehended the northern part of the county. St. Brendan erected a sumptuous monastery here in the sixth century, which, with the town, was destroyed by fire in 1089: it was again reduced to ashes by Cormac O'Culen, in 1151, and, with the town, suffered a like fate in 1179, on which occasion it is supposed to have been entirely demolished. In 1253, Thomas, Lord of Kerry, founded a monastery for conventual Franciscans, probably on the site of the former, which was held in high estimation on account of numerous miracles said to have been performed in it: the founder and several other lords of Kerry, with many of their respective families, were interred in this monastery. A leper-house was founded about 1312 by Nicholas FitzMaurice, who also erected a castle, of which little is recorded until the reign of Elizabeth, when the town was destroyed by a party of the royal forces under Maurice Stack, in 1599; and in the following year the castle was besieged by Sir Charles Wilmot, and, after a vigorous defence for nine days, was surrendered by the garrison, on some small pieces of ordnance being brought against it from an English vessel; the constable was hanged, but the lives of the rest were spared. The castle was re-built by Patrick, lord of Kerry, in 1637, but was demolished by an Irish leader named Lawler, in 1641, and there are now no remains. In the same year the cathedral was also destroyed, and the south transept was afterwards fitted up for divine service. It has always been considered a borough by prescription, there being no charter of incorporation on record. The corporation, under the title of "The Portreeve, Burgesses, and Freemen of the Borough of Ardfert, in the County of Kerry," consisted of a portreeve, twelve burgesses, and an unlimited number of freemen. The borough returned two members to the Irish parliament in 1639, and continued to exercise the franchise till the Union.

(Next week—Armagh.)

CHURCHES USED FOR CIVIL PURPOSES.

(FROM THE ARCHÆOLOGICAL TRACTS.)

"March 25th, 1329, there was a parliament at Dublin, where peace was confirmed between the Earl of Ulster and Maurice Fitz-Thomas. A great feast was held, the first in the castle by the Earl of Ulster, the next day by Maurice in the Church of St. Patrick."

In those days it was not thought improper to use churches for purposes, which we should now think, of merely civil nature. They were the scenes of solemn banquets, and of parliaments, knighthoods were conferred in them, and the debtor was bound to discharge his bond by payment on a certain tomb. Almost all the abbeys, whose foundations is mentioned in these "Annals" belonged to the Cistercians, which seems to indicate that the "Annals" were originally compiled in a Cistercian house, probably, St. Mary's, Dublin.

Thirteen Cistercian abbots were lords of parliament; Mellifont, in the county of Louth, was the first chief abbey in Ireland, and the abbot had precedence in parliament, before all abbots of all orders. At a general chapter held in 1190, the abbots of Ireland had licence to abstain themselves from the chapter for three years, and to attend the fourth: and the abbot of Mellifont was commissioned so to arrange their turns that some of them might attend every year. Notwithstanding the influence of their constant intercourse with foreign churchmen and foreign countries, the monks here degenerated, for in 1221 the correction of Mellifont was committed by the chapter to the abbot of Clairvaux, who was empowered to substitute in that house religious persons by whom the order in those parts might be reformed.

With regard to the national distinctions, so unhappily introduced into Irish religious houses, and noticed by Cox, who states, from a record in the Tower of London, of 1321, that no person was admitted into the abbey of Mellifont unless he made oath that he was not of English descent, the chapter, in 1323, expresses its detestation of such damnable division, introduced by the enemy of the human race, and warns all abbots, and especially those of Ireland, of whom grievous complaints had been made, that they should remove such walls of separation, and indifferently admit all fit persons of all nations.

Christian O'Conarchy was the first abbot of Mellifont; he was sent by Malachy to Clairvaux, that he might be instructed in the Cistercian rule by St. Bernard, and might propagate the order in Ireland. Pope Eugene III. was also a pupil of St. Bernard at Clairvaux.—Grace's Annals of Ireland.*

*Edited, with a translation and notes, by the Rev. Richard Butler.

LITERARY NOTES.

For the man who is gifted with adequate knowledge and endowed with the requisite faculty of artistic perception, there is no more interesting or delightful business to which he can put his hand than that of the bookseller. The trade is also one of the most lucrative, and handsome fortunes are frequently made by those who follow it. Instances of the extraordinary extent to which the value of books appreciate in the course of a few years are so numerous that they are forthcoming almost daily. Thus at a recent London sale the "Gaiete de Paris, or the Rambles of an English Party," with 21 coloured plates by George Cruickshank, made £46, a great advance on the price at which previously it had changed hands; the editio princeps of "David Copperfield," probably specially bound for Dickens to present to the Hon. Mr. and Mrs. Richard Watson, to whom the book is dedicated "as a token of regard and friendship," £30; Blackmore's "Lorna Doone," first edition, £25 10s., and the earliest edition of "In Memoriam," £5 2s. 6d. At the same time, nothing is more remarkable than the fluctuations in the price of the same rare book at different sales—a fact which depends, of course, on adventitious circumstances, such, for instance, as the presence or absence of rich people who may have a fancy for the work offered.

Mr. George Moore, we learn, is at work upon a book about Ireland. It will be called "The Untilled Field," and it may be described as a novel in thirteen episodes. The episodes are short stories, varying from ten thousand words to two thousand words. The theme is always the same, and none of the stories can be said to be an independent story. The same characters recur, and the incidents develop from story to story. A selection of tales will be published separately in Irish. The translation will be made by Mr. P. P. O'Sullivan, a Trinity College student, and a native Irish speaker. "Instead of losing by being translated into Irish," says Mr. Moore, "the stories have gained. I have read the translation of one from the Irish. It was extraordinarily like my original text, but it was fresher. One was like a jaded townman, the other was like the townman after a dip in the primal sea. Dipping is as good for stories as for human beings." The Irish book will be published this month.

The "Academy" tells a piquant little story of a recent disagreement between M. Catulle Mendes, the dramatist, and Mme. Sarah Bernhardt, which should be laid to heart by authors who are inclined to wax angry over the rejection of their works. M. Catulle Mendes, it appears, had arranged with the famous actress to produce a poetical drama. Something untoward, however, occurred, which led to a quarrel, as the result of which the play was withdrawn. What will he do with it? Burn it? Re-write it? Send it elsewhere?

No. "I shall put my poor drama into a drawer, for Sarah will understand that I cannot again offer it to the Comedie Francaise. It will sleep there for a long while. The drawer will be a little coffin, where I shall sometimes place a few flowers. They will be red roses, to express my admiration for Sarah, and violets, to express my regret at her capriciousness." Surely, it is sometimes useful to be a Frenchman.

"Fan Fitzgerald," by Mr. H. A. Hinkson (Chatto and Windus), is a novel, dealing with Irish life, which has received appreciative notices in the newspapers. The narrative centres round the efforts of Richard Burke, a young landlord born in Ireland but who has spent the greater portion of his early life abroad, to improve the condition of the peasantry of the countryside in which his estate is situate. When the hero was still at Oxford, and as yet had no insight into the character of his countrymen, a visit which he paid to Ireland awoke in him feelings to which he had hitherto been a stranger, and altered his ambition:

> The glamour of Ireland had caught him, that strange and indefinable charm compounded half of joy, half of sorrow, which has drawn and held even strangers, as well as those who are exiles and the children of exiles.

His experiments meet with a certain amount of success, but the moral of Mr. Hinkson's book is evidently to the effect that the character of the Irish peasantry is incomprehensible except to the man who has lived amongst them all his life, and that no attempt at the amelioration of their condition can be successful which is not directed by the national genius.

The Great White Horse Hotel, of Ipswich, associated with memories of Charles Dickens, was sold by auction the other day, and purchased by the present lessee for £14,500.

Mr. Robert Brown, Jun., the antiquary, publishes, through Messrs .Williams and Norgate, a volume of miscellaneous writings under the title, "Mr. Gladstone as I Knew Him, and other Essays." One of the essays is political. That on Mr. Gladstone is not, for the author's knowledge of the statesman was entirely Homeric. The remainder of the essays are chiefly literary and antiquarian.

A very pleasant picture of the Great Napoleon is given in Chateaubriand's "Memories d'Outre-Tombe," which has just been translated into English by Mr. T. de Mattos (Freemantle):—

I was in the gallery when Napoleon entered; he struck me pleasantly. I had never seen him except at a distance. His smile was beautiful and caressing; his eyes were admirable, owing especially to the manner in which they were placed beneath the forehead. . . Incontinently Napoleon moved away. As with Job, in my night "a spirit passed before me, the hair of my flesh stood up. There stood one whose countenace I knew not . . and I heard the voice, as it were, of a gentle wind.

Napoleon, Chateaubriand says, was a great discoverer of men.

On March 11th, 1702, the first English daily paper was issued in London. It was entitled, the "Daily Courant," and had its office "next door to the King's Arms Tavern at Fleet Bridge." Thus Fleet street was the cradle, as it is now the "hub," of daily journalism. The proprietor of the journal was one E. Mallet, and to give this pioneer his due, it must be admitted that he had good ideas. His design was to publish every day the news arriving from foreign parts without the padding indulged in by so many of the Gazettes, Posts, Intelligencers, and News Letters of the day. In a word, the proprietor of the first English daily paper was the first foe of prolixity in journalism, and the first friend of the busy man who wishes to gather the most important news of the day with the minimum of effort. The "Daily Courant" at first cost a penny, but the price was afterwards raised to two pence.

"Anecdotal Recollections of the Congress of Vienna" (Chapman and Hall) contains an interesting account of the ball given in the Austrian capital by Lady Castlereagh. The raconteur dubs the entertainment "Vanity Ball," and says of it: The sumptuousness of the supper failed to thaw the iciness of the affair. As for the host, according to his habit amidst all those animated fetes where everything was given over to pleasure, he seemed preoccupied and smitten with care. Even when his lordship danced, he seemed to be bent upon giving his serious thoughts the slip by the accelerated movement of his legs, disporting himself in an Irish jig or a Scotch reel. Did Lord Castlereagh really endeavour to get away from the disappointments of an insidious and miscarried policy? Did he already ponder the last scene of the political drama of his life, when the stoicism of Cato, added to the sombre results of his spleen, made him escape by suicide from tardy and by then useless regrets?

The American Newspaper Publishers' Association is already taking alarm at the increasing scarcity of the material for the manufacture of wood pulp (spruce logs), and they have accordingly decided to ask Congress to abolish the duty on wood pulp, mechanical ground wood, and lumber used in the manufacture of paper. They also intend to petition for a reduction of the duty on news-print paper. The matter, it is obvious, is one of great importance for newspaper proprietors in the States. The very scarcity of the material favours a combination of the paper manufacturers. As soon as the latter can control the supply, they can advance the price, and may be forced to do so, even against their will. The publishers, as a general rule, cannot advance the price of their newspapers without incurring great risks. A one-cent. newspaper, for example, cannot raise its price to two cents. without danger of losing the bulk of its circulation, yet a small advance in the price of white paper may make it impossible to sell at one cent. per copy without loss. The entire Press of the country is facing the problem of an advance in the price of its raw material, which will come soon, unless the supply of wood pulp can be increased. It is worthy of note that a high-class and well-informed American journal expresses the opinion that the movement for free wood pulp will be resisted and defeated unless the newspapers solemnly tell their Congressmen that they will oppose the re-nomination and re-election of every one who votes against the measure.

No person who reads the following from "Punch's" "Authors at Bow street," can doubt that there is plenty of material for amusement in the Shakespeare-Bacon controversy:—

Elizabeth Wells-Gallup, an American, who described herself as a Verulamaniac, and gave her address at Ham Common, was charged with ignoring Lee's majeste, in that she had alleged in public prints that Mr. Sidney Lee could do wrong, and that Shakespeare was Bacon. She was also charged with michling mallocko, and old indictable offence dating from the reign of Queen Mab.

The prisoner asserted in Gay and Bird-like tones that she had never heard of Mr Lee. Very likely there was no such person. She had no doubt that if she were to examine one of his books she would find evidence of other authorship.

She would repeat with even more emphasis her old assertion to the effect that after reading Shakespeare's first folio at breakfast she found distinct traces of Bacon on the leaves.

The first folio being produced in Court, Mr. Lee denied that it contained traces of Bacon. The marks, he contended, were the result of margarine.

Mr. J. Holt Schooling, statistician, said that he had carefully counted all the italics in the twenty-six first folios of Shakespeare which Mr. Lee had placed at his disposal. The total was 15,641,616. These figures, it will be seen, can be divided into 1564 and 1616, the birth and death dates of William Shakespeare. (Sensation.)

Mr. William Shakespeare, professor of singing, was next called. He declared emphatically that Bacon never agreed with him.

Sir Thomas Lipton, Baconian expert, affirmed that if any of his young men offered copies of the Temple Shakespeare in place of rashers, his customers would all leave him.

Mr. W. H. Mallock gave evidence on behalf of the prisoner. His attention, he said, had first been drawn to the interesting theory by a letter in cipher, which he had received from her. After obtaining the key from the De Augmentis, he discovered her missive to run as follows: "You ask, 'Is life worth living?' To which I answer, It depends on the liver—and Bacon!"

After further evidence, the Bench found Mrs. Gallup guilty on both counts, and sentenced her to read through the Dictionary of Rational Bi-Hography.

The pun on miching mallecho in the above is very ingenious; for miching is truancy, and mallecho mischief, and Mr. Mallock. . . .

The Nernst electric lamp, which differs from the ordinary incandescent lamp in not requiring a vacuum bulb to contain the glowing filament, has at last, it is asserted, been developed into a commercially available form. The glowers are small, oblong bits of porcelain-like material fused to the ends of platinum wires. In order to maintain a constant current in the glowers they are connected with some glass tubes in which iron wire is mounted, the iron being protected from oxidation by a chemically inert gas filling the tubes. From 1 to 30 glowers are enclosed in a ground-glass globe intended to soften and diffuse the light. The candle-power varies from 50 for a single glower up to 2,000 for a group of 30. It is thought that the new lamp, the light of which is very steady and in quality resembles daylight, will be especially useful in place of arc-lights for streets, large shops, picture-galleries, and drawingrooms.

Hitherto the United States has had the distinction of possessing both the remains of the largest land vertebrates ever known to have existed, the giant dinosaurs of the West, and the smallest living vertebrates of either land or sea, certain cyprinodont fishes of the Florida and South Carolina coast. But lately the United States Fish Commission has received from the Philippine Islands specimens of a new species of fish, belonging to the goby family, which are smaller than any vertebrate animals yet known. They vary from less than 10 up to about 15 millimeters in length. Their numbers are so enormous that they form an important article of diet for some of the natives, who catch them in close-woven nets. It is proposed to call this new fish mystichthys, from two Greek words meaning smallest fish.

How blaze our sputt'ring links, how tall we grow,
In chambers windowless, 'neath rafters low!
So, in this world of dwarfs hung round with night,
Promethean gods they seem, who bear the light.

THE INFLUENCE OF MUSIC.

By M. J. B.

Songs of our land, ye are with us for ever,
The power and the splendour of thrones pass away;
But yours is the might of some far flowing river,
Through summer's bright roses or autumn's decay.

"Irish Penny Journal," i., 284.

Fletcher of Saltoun, the Scottish political writer, will long be remembered for his wise observation—"If a man were permitted to make all the ballads, he need not care who should make all the laws of the nation." The sentiment is, of course, as old at least as the time of Plato, but the apophthegm of Fletcher puts the idea in a nutshel. Hence it was no unfounded bigotry that penalised the bards, the music, and the ballads of Ireland. Our Milesian ancestors themselves were keenly alive to the ridicule which kills, and our ancient laws contain many stringent regulations on the exercise of the bardic professional skill. Indeed it was even believed that the musician wielded a magical power which was potent even to taking away life. The learned O'Donovan has a brief discourse on this matter in his introduction to "The Tribes of Ireland" (Dub., 1852). No more striking instance, perhaps, of the political influence of the ballad can be offered than the popularity of the Stuart cause. Here were the most miserably despicable of tyrannical poltroons, exciting the most exquisite devotion, and for absolutely no cause whatever except the influence of the ballad-mongers, who, proscribed by the Puritans, turned all their art to the cause of the most worthless of kings.

Cromwell had necessarily to proscribe music when he proscribed the monarchy—a change in Government, according to Plato and to all experience, necessitating a change in the popular music. The Presbyterians were obliged to follow suit in order to establish the new worship (2). For exactly the same reasons the early Christians were very cautious about permitting music, theretofore used in pagan worship, into their rites (Alzog i. 486), and subsequent events showed the wisdom of this caution (id .488-. Alzog synchronises the reform of the German Church with "a decided preference for the grave and stately church music of earlier ages" (i. 288).

The poet Sperser, in his "View of Ireland," lays great stress on the influence of the Irish bards, and we have an Act of Parliament reciting that none dared refuse the minstrel what he required, lest he be ridiculed in song (10 and 11 Chas. I., c. 16 Ir.). Spenser advised the extermination of the bards by martial law (251). In our own time who will estimate the effects of the poems of Davis and the young enthusiasts of the "Nation" newspaper? In his speech on the prosecution of Parnell the Attorney-General told the jury—"There is no movement in Ireland or elsewhere of this character which has not derived some support, generally from popular ballads. Forty years ago we had the 'songs of the "Nation,"' and some of them were very spirited and effective poems. In fact, from the days of Tyrtæus to the present, popular ballads have been found an admirable mode of preaching popular doctrines." (The Queen v. Parnell and ors., 89).

Polybius, one of the gravest of those ancient historians who were no mere chroniclers, but were profound philosophers and keen-witted statesmen, points out that the Cynæthians came to their ruin through neglecting the cultivation of their music (iv. 3). On the other hand, the Greek prisoners of war so captivated their Sicilian taskmasters with sweet melody that they obtained their freedom (Rollin viii. i. sec. 14, 332).

So astute a historian as Robertson did not fail to inquire into the songs of the American natives before sitting down to write the history of their polity (Hist. America iv. sec. 8, works 9, p. 209).

Indeed, so convinced were the savants of ancient times of the great influence of music that we find them classifying melodies according to their effects.

Thus Aristotle divides music into moral, practical, and rapturous (Pol. v.). Our own ancestors had lullabies, mirth-provoking and plaintive (O'Curry iii., 214). Cassiodorus, a Roman statesman of the sixth century, has the Doric, leading to modesty and chastity; the Phrygian, exciting rage; the Æolian, quelling the tumult of the soul and lulling to sleep; the Ionic, quickening the perception and lifting to heaven; the Lydian, filling with delight (O'Curry's Lectures, i., dcxxxv).

"Pious authors of the middle ages are," writes Dr. Sullivan, late President of Queen's College, Cork, "fond of attributing certain æsthetic effects of a religious character to the eight church tones. Thus the first tone was considered to be grave and serious, and to express the spirit of prayer; the second to be mournful, and to express the spirit of penitence," etc. (O'Curry's Lectures, i., dcxxxv).

Indeed, have we not the warrant of Holy Writ that music is potent to lay the evli spirit himself? (I. Kings, xvi., 23).

Cambrensis reminds us that music soothes disease and pain, and alleviates toil. Hence artificers of all sorts relieve the weariness of their tasks by songs (Top. Dsct. iii., C. xii.). Therefore, when Josias would rebuild the Temple, he set musicians to encourage the workers (II. Par. xxxiv., 12).

Disraeli in his "Curiosities of Literature" has selected various authorities on medical music.

Father Tom Burke, the great Dominican preacher, in his lecture on the National Music of Ireland, claims that the hearing is the most spiritual of all the senses, and hence that actions called into being through melodies came straight from the soul. However, this is rather a metaphysical aspect of my subject, and I had better not pursue it further—ne sutor ultra crepidam. I have said enough, I trust, to set my readers a-thinking and investigating for themselves, and I believe the more they push investigation the more impressed will they become with the importance of cultivating and the far-reaching effects of the influence of music, and the more will the value of Dr. Douglas Hyde's collection of the songs of Connaught be appreciated.

DUBLIN PENNY JOURNAL

TO OUR READERS.

In obedience to olden and rather hackneyed custom, we have felt bound to place before our readers some statement as to the purposes and objects which we hope to serve by re-establishing the Dublin Penny Journal. We are ourselves convinced that there is no more real need for doing this in the first number of any periodical than in the issues which succeed it, but we have been gravely assured that if we fail to submit a programme of action and a statement of policy to the public, the aforesaid public might be unable to appreciate the ends which we have in view. Personally, we rate at a higher level the intelligence of those whom we hope to enlist as supporters of the Dublin Penny Journal, and we are inclined to think that the present number of that periodical will in its contents suffice to make clear to all who feel any interest in our project the nature of the work we have taken in hands.

As the model of our present enterprise, we have adopted the lines laid down by the conductors of the original and famous Dublin Penny Journal, which sixty years ago proved a means of bringing together a brilliant band of writers on various subjects connected with Irish art, archæology, literature, and science. Of late there has been witnessed in our midst what can only be described as a renaissance of interest in matters connected with the past history of our race and country, as well as in those affecting the development of the intellectual and material resources of the nation. For all those who are inclined to assist the growth of a movement which, in our judgment, must tend towards worthy ends, it is our desire to make the new Dublin Penny Journal a medium of expression of thought and for the publication of their views on questions of moment to the people of Ireland of all creeds, classes, and sections.

In pursuance of the object which we have set before us and which we hope to be ble to accomplish, we have decided that our Dublin Penny Journal shall be strictly non-political, in any party or factional interpretation of the phrase. We are, however, convinced that there are a sufficient number of Irishmen and Irishwomen eduted and enlightened enough to realise the advantages which must accrue from the establishment of an organ of an entirely non-partizan character and which will aim

at the maintenance of a spirit of true and intellectual patriotism.

Although the first number of the new DUBLIN PENNY JOURNAL is exactly double the size of its celebrated prototype, we trust that the day is not far distant when the support accorded it will enable its enlargement and the amendment of the many defects of which no one can be more conscious than we are ourselves.

Communications of a literary nature should be addressed to the Editor of the DUBLIN PENNY JOURNAL, 90 Middle Abbey Street, Dublin.

GALWAY BAY.

Here, from the highlands, I gaze far down on
thy glories, O! Galway Bay:
Long reaches of light, lone splendours of gloom,
dim isles in the far-away;
In the utmost east lies a silver streak, like the
sheen of some radiant soul,
And the mountainous cliffs of the southern coast
stand out where the waters roll!
And the pallid clouds dim not heaven's glorious
blue, but gleam in the shimmering glow
That is blown from heaven on the woods, on the
hills, on the sea lying far below.
Oh! Man's life is glad, and the sunshine good,
and the whole world throbs with delight!
The lark is singing! The buds are bursting! The
wavelets are flashing bright!
To the wide, glad scene, to heaven's heights
above, to thy plains, O! entranced sea,
My heart rushes out! O! Nature, O! World, how
full can life's longing be!

. . . . . .

But, sudden, the sea grew a deep dark blue, with
foamy flecks at the rim
Near the hard rocks, while the mountain-slopes
receded misty and dim,
And a great black cloud drew down o'er the sun
at the edge of the sky,
Like an angry frowning eyebrow o'er a deep,
flashing eye!
And, with those waters darkening, a cloud came
o'er my soul
As I thought of the ocean of Time, and the count-
less years, that roll
Sorrow on crowded sorrow, toil upon endless toil,
Till the hard-grown hearts, like yon hard, cold
cliff, from all suns' warmth recoil,
Bare and unfruitful, ever undewed by love, but
furrowed and scarred
By the wind-spit rains of jeering and hate, till
the sapless veins are barred
With bars like those of unpassioned death, and
lone in the great world wide,
Unfeeling, unfelt, unmarked, save by Him who
comes at the ebbing tide,
O! God, Thy fair world we have ravaged and
soiled, and our hearts are grown sordid and
cold:
And brothers care not that brothers mourn, and
kindness is bought and sold!
Thy whole creation groaneth together and tra-
vaileth in pangs of birth,
And the time is near when the old must pass in
the newness of heaven and earth!
Bow Thy heavens, O! Lord, and come down;
Let the voice of Thy thunder move,
Touch us and fire us, purge and restore, with
the lightning-flame of Thy love!

REV. ARTHUR H. TREVOR BENSON.
The Rectory, Castleconnell, Co. Limerick.

The American House of Representatives passed a Bill recently which is intended to restrain the sale of margarine, coloured to resemble butter, by the imposition of a tax of 10 cents. a pound on such products, as compared with a tax of only a quarter of a cent. a pound on the uncoloured product. The Bill is so drawn as not to interfere with the right of a State to permit the sale of margarine which is manufactured and sold within the limits of the State.

THE HISTORY AND ANTIQUITIES

OF THE

CITY OF DUBLIN.

FROM THE EARLIEST ACCOUNTS:

COMPILED FROM

Authentick Memoirs, Offices of Record, Manufcript Collections, and other Unexceptionable Vouchers,

BY THE LATE

WALTER HARRIS, ESQ.

WITH AN

APPENDIX.

CONTAINING

An Hiftory of the Cathedrals of CHRIST-CHURCH and St. PATRICK, the UNIVERSITY, the HOSPITALS and other Public Buildings.

Alfo two Plans, one of the CITY as it was in the Year 1610, being the earlieft extant; the other as it is at Prefent, from the accurate Survey of the late Mr. ROCQUE; with feveral other Embellifhments.

MDCCLXVI.

CHAPTER I.

SECT. I.

To point out the precise time when the city of Dublin was first built, would be a vain attempt, and not reasonably to be expected; especially if it be considered that few cities are laid out all at once, but from the advantages of trade, the residence of Kings, navigable and convenient ports, natural situation, or other dvantageous circumstances, they receive a gradual growth and increase; so that what only a mean village now, may in future ges be a large, and populous city, of which the world affords us many instances. The ancient Irish were at no trouble in erecting and fortifying cities, or in providing for themselves habitations of solid and lasting materials; their houses were built of twigs and hurdles, and covered with sedge or straw, and their cities were like those described by Cæsar (a) among the Britons, their ancestors, namely, "a thick wood, enclosed within a ditch and rampart, and made for a place of retreat."

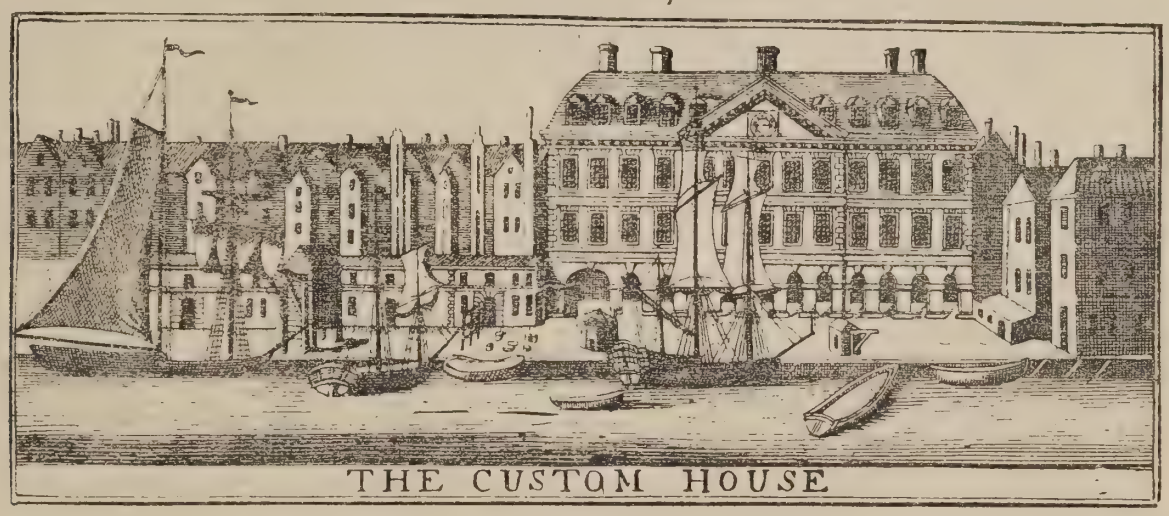
Tara, in Meath, was for ages the principal residence of the monarchs of Ireland, where they held their solemn festivals and conventions upon all extraordinary occasions, and to which, of course, there was a vast confluence of the nobility and gentry at stated times; and yet so slight were the buildings there for the reception of such multitudes, that at present the least ruins or footsteps of any ancient pile there do not appear. Roderick O'Connor, King of Connaught, is reported to have been the first person in Ireland who erected a castle of lime and stone at Tuam, and that so late as the year 1161, which was looked upon as such a novelty then, that it got the name of "the wonderful castle." Yet it is not to be denied but that cities were built and fortified in Ireland long before the arrival of the English, as Dublin, Limerick, Waterford, Wexford, and Cork; but we are indebted for those works to the labours of foreigners, the Ostmen or Danes, many of whom settled here early on the score of traffic, though they did not come hither in an hostile way till about the beginning of the ninth century.

Though Strabo (who wrote his geography in the reign of Augustus Cæsar, about the time of the Christian era) mentions Ireland, yet he is entirely silent in regard of Dublin. But we cannot justly infer from his silence that there was no such place existed at that period. Every reader of Strabo must have observed that his acquaintance with those remote parts was but superficial, for he places Ireland at the north of Britain, if we rightly under-

(a) Comment. lib. 5.

stand his words (a); nay, he ingeniously confesseth that what he relates of Ireland he has taken from the testimony of witnesses not worthy of credit.

The earliest account we meet of Dublin, in any authentic writer, is in Ptolemy, who flourished in the reign of Antonius Pius, about the year of Christ 140, and calls it Eblana Civitas (at least, his translator, Maginus of Padua, so renders it), and he places it under the same parallel with the present subject of our inquiry. This, without having recourse to fable, gives Dublin a just claim to antiquity of more than fifteen hundred years. For unquestionably it must have existed for a considerable time before Ptolemy wrote, or he could not immediately have come to the knowledge of it. The historians (b) of Ireland take notice of it in a short time after Ptolemy. For there having been many sharp battles fought between Con Ceadcathach (in Latin, Quintus Centimachus), King of Ireland, who began his reign A.D. 177, and Mogha Nuagad, King of Munster; a peace was at length made between them, which produced a new division of the kingdom, whereby the fourth part, bounded by a chain of little hills, extending from the High-street of the city of Dublin in various branches to the kingdom to Galway, and called Aifgir Rieda, fell to the share of Mogha Nuagad, and from thence was called Leth-Mogha, or Mogha's share, and all northward of those bounds was allotted to Conn, and called Leth-Quin, or Conn's portion. This bipartite division was made about the year 191; but it did not subsist longer than a year, when it was overturned by the ambition of Mogha-Nuagad, who thought himself over-reached in the partition; because the half of the harbour of Dublin, which he observed to be commodious for traffic and fishing, did not fall within his allotment, to recover which he again commenced hostilities, and fell in the attempt.



Joceline (a) also, in his life of St. Patrick, mentions Dublin in the following manner: "St. Patrick, departing from the borders of Meath, directed his steps towards Leinster, and having passed the river Finglass, he came to a certain hill almost a mile distant from Ath-Cliath, now called Dublin, and casting his eyes round the place, and the circumjacent country, he is reported to have broke out into this prophecy: 'That small village shall hereafter be an eminent city; it shall increase in riches and dignities, until at length it shall be lifted up into the throne of the kingdom.'" But this monk soon forgets himself, and, in the next chapter save one, introduces St. Patrick into "the noble city of Dublin," of which Alphin MacEochaid was King. The former part of this quotation must certainly be foisted into the manuscript of Joceline for the sake of the prophecy; for no writer could be so negligent as to utter such manifest contradictions within the compass of a single page: besides the fact contradicts Ptolemy's account, who some centuries before St. Patrick gave it the appellation of a city.

The next ancient authority concerning Dublin is King Edgar's charter, called Oswald's law, dated at Gloucester in the year 964, the preface to which runs thus in English: "By the abundant mercy of God, Who thundereth from on high, and is King of kings, and Lord of lords, I, EDGAR, King of the English, and emperor and lord of all the islands of the ocean which lie round Britain, and of all the nations included in it, give thanks to the omnipotent God, my King, Who hath so greatly extended my empire, and exalted it above the empire of my ancestors, who though they obtained the monarchy of all England, from the reign of Æthelwulf, who, first of all the kings of the English, by his arms, subdued all the nations inhabiting Britain, yet none of them ever atempted to stretch its bounds beyond Britain. But divine Providence hath granted to me, together with the empire of the English, all the kingdoms of the islands of the ocean, with their fierce kings, as far as Norway, and the greatest part of Ireland, with its 'most noble city of Dublin,' all which by the most propitious grace of God I have subdued under my power." Some writers (a) have called this charter in question; but they are such who repine that the English should have any footing here at all, not duly reflecting what happiness they enjoy under the mild administration of the best of laws, compared with the misery they suffered while their own rude customs prevailed. The Saxon annals relate "that the power of Edgar was so great, by the means of a considerable fleet and army, which he supported, that the kings of Wales, Ireland, and the Isle of Man were obliged to swear allegiance to, and acknowledge him as their sovereign:" which might have given rise to those expressions in his charter relating to his conquest of a great part of Ireland. That some of the Anglo-Saxon kings had a dominion over the city of Dublin, and perhaps over other parts of Ireland, seems to be clearly evinced by a coin of King Ethelred, next successor but one to Edgar, the legend on the reverse of which expresseth the mint-master's name, and the place where it was struck to be at Dyfelin. Now Ethelred could not assume this mark of sovereignty, of minting money within the dominions of a prince, who did not acknowledge him as his superior lord; and this casts some light over the before-recited charter of King Edgar. 'Tis certain that the Danes, under princes of their own, held the actual government of Dublin during the reigns of both these princes; yet it is no way improbable that they held that city by homage and tribute, though

OLD CUSTOM HOUSE, DUBLIN.

The above engraving, from Harris's History of Dublin, shows the old Custom House which stood on the site, on the present Wellington Quay, now occupied by Messrs. Dollard's Printing House.

(a) Εἰσὶ δὲ καὶ ἄλλαι περὶ τὴν Βρεττανικὴν νῆσον μικραὶ, μεγάλη δ' ἡ ΙΕΡΝΗ πρὸς ἄρκτον ἀυτῇ παραβεβλημένη.—There are other small islands about Britain, but one large island called Ireland, extended along it, (*i. e.* Britain) towards the north.—Geog. lib. 4. edit. Cafaub. p. 201.

(b) Ware's Lat. Antiq. cap. 3. Flahert. Ogyg. p. 315. Keat. Hist. p. 3. 113.

no mention is made of it by historians. This circumstance elucidates all the difficulties in Edgar's charter, the Saxon annals, and the coin of Ethelred, before mentioned, which is at present in the possession of a gentleman of the physico-historical society. Thus far of the antiquity of the city of Dublin.

SECT. II.

THIS city has been known by various names. The Irish called it Drom-Choll-Coil, i.e., "the brow of a hazel-wood," from an abundance of those trees growing about it. But this name must have prevailed before (by the great increase of buildings, and confluence of inhabitants) it merited the character of a city. The other names since appropriated to it are all founded on much the same reason. The Irish to this day call it Ath-Cliath, i.e., "the ford of hurdles"; and Bally-Ath-Cliath, i.e., "a town on the ford of hurdles." For before the river Liffey was embanked by quays, people had access to it by means of hurdles laid on the low and marshy parts of the town adjoining the water, from which hurdles it took those names, and not from the foundations of it having been laid on piles or hurdles, as some have asserted. We have observed before that it was called Eblana by Ptolemy, upon which word Mr. Baxter (a) has a conjecture, not indeed unsatisfactory, that the word Eblana has been maimed, and that the true reading is Deblana, which proves to be the termination of two British words, "dur" and "lhun," i.e., "black-water," or a "black-channel," the bed of the Liffey in this place having been boggy, and, consequently, the water black. It is certain that ancient geographers have often truncated the initial letters of proper names of places. For instance, instead of Pepiacum and Pedidii in Wales, Ptolemy writes Epiacum and Epidii; and for Dulcinium, now called Dolcigno, in Dalmatia, he has Ulcinium, and Pliny, Olchinuim. The inhabitants of Fingal* call this place Divelin, and the Welsh, Dinas-Dulin, or the city of Dublin, to this day.

SECT. III.

WHO were the original inhabitants of Dublin, is a matter both as uncertain and obscure as the time in which it was built: at best, we are under the disagreeable necessity of founding our reasonings on conjecture. The Blanii, Eblana, or Deblani (according to Mr. Baxter's notion, before mentioned), inhabited the tract of country now comprehending the city and county of Dublin, and a considerable part of the county of Meath.

It is probable they were ancient natives, and either gave the name of Eblana to the city, or took their names from their situation in or near it. But from what country this colony came hither is a matter rather to be guessed at than ascertained. It seems to be the most satisfactory opinion that they came from that part of Britain called Wales, on account of its proximity, the almost identity of languages, and the close conformity of ancient religious rites and ceremonies of both people. The same reasons are given by Tacitus why the Gauls peopled Britain. Hence it is probable that the northern and north eastern Irish derived their origin from the North of Britain. It cannot, however, be denied but other colonies might have, on unknown accounts, arrived here from more remote parts, at different periods, as the Milesians, for instance, from Spain. That the Danes, under the denomination of Ostmen or Easter-lings, built the city of Dublin, or at least fortified and inhabited it, is agreed on all hands; but at what time is not so clear as could be wished. Some allege that they founded it about or before the time of the incarnation, while others transfer that event to the 9th century. Be it as it may, we must leave the fact undetermined, since history has given us no certain light into the matter. We may, indeed, with safety conjecture that it was built and inhabited first by the Irish, as a village, or small fishing town; but that the Welsh and Ostmen, at different periods, finding its situation commodious for trade, made a settlement for that purpose. If Edgar's charter be allowed of any weight (and there seems to be no reason to controvert its authenticity), we may reasonably suppose that that monarch strengthened the old British colonies in Ireland by encouraging a new race of Britons to settle among them. Henry II. pursued the same political steps. For upon the submission of the Irish potentates to him, in 1172, he early the year following, by charter dated at Dublin, "granted to his subjects of Bristol his city of Dublin to inhabit, and to hold of him, and his heirs for ever, with all the liberties and free customs, which his subjects of Bristol then enjoyed at Bristol, and through all England." This charter is the foundation of the liberties of the city of Dublin, which were afterwards enlarged and confirmed by King John, and other succeeding monarchs, and by divers acts of parliament, yet extant in the Rolls-office, of which more hereafter.

(To be continued.)

(a) Gloffar. verb. Deblana.

*In the county of Dublin, to the north of that city.

In referring to the legislation of 1901 affecting local authorities, the 1902 edition of "The Municipal Year Book" states that some unusual clauses were in the Manchester Corporation Act, 1901, which dealt mainly with the construction of tramways and streets and the acquisition of land. These clauses enable the Corporation to make regulations as to the conditions upon which licences authorising children to trade in the streets may be granted, subject to the approval of the Home Secretary. A child trading without such licence may be arrested by a constable without a warrant. A Summary Jurisdiction Court has then power to transfer the custody of the child to a relative or some other fit person, or, if he is under 14, to order him to be sent to an Industrial School. The Corporation may contribute the whole or part of the expenses of the maintenance and education of any child thus dealt with. It may also contribute to the expense of lodging, board, and clothing of any child licensed by it to trade in the streets.

A TRUE MAN.

Yours is the courage which but few suspect;
Yours is the courage which can bear neglect;
Yours is the courage which can suffer long,
The courage of the man whose soul is strong.

"BROKE AWAY"

A MODERN STORY.

The most hopelessly incorrigible old bachelor who rode with the Meadowthorpe Hounds was Major George Barclay—or, indeed, he was so considered until Mrs. Hawtrey came to Meadowthorpe. And by that time the snows of many winters had whitened the Major's hair until its fairness rivalled their own.

There was never a dance at the Meadowthorpe Club or at one of the country houses in the neighbourhood, never a jolly dinner or a jollier stag affair but the Major was there—very much there, in fact, for he was the best of company. And when hounds were running the Major was always well up in the field, mounted on one of his two or three trusty hunters. He was a good man across country, and he always had at least a couple of useful horses in his stable.

Few knew where or when he acquired his military title. They only knew it fitted him well. Doubtless the Meadowthorpe Hunt set would have been surprised to learn that he earned it by valiant service in the American Civil War. He was not given to talking about himself. If he had "fought the good fight"—well, that was a long time ago. At present he was chiefly concerned with fox-hunting and polo.

There was a lurking suspicion in the minds of some that the Major was rich, but this suspicion was unfounded. He had enough to live on very comfortably in a modest cottage home on the outskirts of Meadowthorpe; to maintain his modest household, which consisted of Riggins, his body servant, who had been his orderly in the army, and the latter's wife, who looked after the culinary department; and his stable, which was much more commodious than his house, where one groom attended to his modest stud.

In his unpretentious little red cottage the Major lived an ideal bachelor life. His faithful servants knew his every whim and prejudice, and pampered him disgracefully. The cellar was well stocked with certain choice brands of Burgundy and old Scotch, which the Major particularly affected. In all the length and breadth of that half acre which Major Barclay called his own, there was no one to say him nay; he was an absolute monarch of that little territory.

Once upon a time the Meadowthorpe mammas still counted the Major among those to be reckoned with in the matrimonial disposition of their daughters, but that was before the Major's hair became absolutely snow-white, and before they learned the hopelessly bachelor-like order of things which existed at the little red cottage.

But Mrs. Hawtrey, you see, didn't know all this. She came to stay with the Hallidays late in the summer, and remained for the Hunt races in the fall.

The Major was a frequent diner at Halliday Hall, and he was altogether charmed with the young widow, whose half-mourning of violets and black and whites was extremely becoming to her style. She was tall and rather slight, with rich golden hair and dark eyebrows, a

combination which the Major had always admired.

Then, too, the Major, with a prejudice which is inconsistent but not unusual, disliked any tendency to "horsiness" (an ugly word, but the only one) in a woman; and Margaret Hawtrey did not know one horse from another, though she begged the Major very prettily, soon after he met her, to teach her to ride.

The riding lessons commenced forthwith and progressed so rapidly that by the time Meadowthorpe race meeting took place Mrs. Hawtrey could sit straight in her saddle and put her horse into quite a lively canter without screaming a pretty musical little scream of her own, used with great effect at certain junctures. The Major would take his fair pupil for long rides through the country lanes; and as the walk was the gait which Mrs Hawtrey preferred, they seldom returned in time for lunch. The autumn scenery about Meadowthorpe was particularly fetching that year, and Riggins and his wife began to wonder whether they had money enough in bank to start a stationery shop in the village. They could see straws blowing in the wind as well as anybody.

It was not until the races finally took place that Major Barclay himself began to suspect the condition of affairs and to realise that the teacher had been taught something during those long morning riding lessons. When he saw Mrs. Hawtrey smilingly holding her court from the box-seat of the Halliday drag at the races and felt a little pang of jealousy every time she spoke to another man, he could not but acknowledge to himself that his time had come. He was touched at last.

The Major rode home very soberly and thoughtfully to the little red cottage, and all that evening he sat before the fire and took counsel with his pipe and Jorricks, a sympathetic brindle bulldog. Finally he got up and looked in the glass and examined his white hair very critically. Then he turned in for the night.

Early next morning there was an anxious colloquy between Matthews, the Major's groom, old Riggins, and Matilda, his wife, in the kitchen.

"Rum go, this," said Matthews. "Blessed if I know what's up. 'Ere we are—first meet of the 'ounds—nine o'clock at the kennels, and the gov'nor orderin' 'is 'oss at eleven. I've been 'ere now ten seasons, and I never saw 'im miss the first day before."

"Well, you'll see him miss it again," said Riggins oracularly; "that is," he added in a dubious voice, "if you're here to see."

"You needn't worry," said Matilda gloomily, as she set about making preparations for her master's breakfast. "We won't none of us be here long if he gets married. I'd like to see myself," she added with a snap, "a-takin' orders from that slip of a thing."

"P'r'aps he's forgot about the hounds meetin' to-day, Matthews," said Riggins hopefully.

"Well if 'e 'as," said the groom, "then it's hup sure enough. 'E never forgot a fixture before in 'is life."

"That's so," said Riggins, his face falling again. "Well if it's got to be it's got to be." So the three went anxiously about their respective duties, hastened somewhat by an impatient ring of the Major's bell, which meant, as they all knew well, that he wanted his shaving materials.

Matthews led Sobersides, the Major's best hunter, a big, strapping bay, around to the door slowly. Sobersides was inclined to be festive and to belie his name. He tried in vain to rear, and lashed out behind viciously.

"Blow me," soliloquised Matthews, "but I believe the old chap knows as 'ow there's 'untin' to-day. Precious little you'll see of it, my boy," he said, patting the bay sympathetically on the neck. "Blessed if it ain't too bad, too—and you a-playin' ridin-school 'oss all summer."

The Major mounted, and took his way slowly through the village and along the highway to Halliday Hall, which was about three miles further on. As he was in no great hurry to get there, he kept Sobersides down to a walk, with some difficulty.

The Major was about to take a big leap, and he didn't know what sort of a landing he would make. Out hunting he knew the importance of not "funking" when approaching a jump, but this was a different matter. There was plenty of time—he might as well think it over as he rode.

"Guess I'll have to give you up, old boy," he said, patting Sobersides affectionately on the shoulder. "No more fox-hunting, no more dinners at the club, no more little suppers to the boys at the cottage. It will come a bit hard at first, I suppose."

"But, pshaw! Who wouldn't renounce the world, the flesh, and the devil for such blue eyes as Margaret's? Fancy comparing dinner at the club with a snug little meal en famille—just she and I, with a little round table, and her pretty face on the other side of it. I declare she will make the old red cottage look——"

"Ah, but there's the rub. That little old cottage would never suit her. I'll have to hunt up a more appropriate place," and the Major sighed, for the old cottage with its cozy living-room and the cheery wood fire burning in it, were very dear to him, as were also Sobersides, and Jorrocks, the old bulldog, and Riggins and his wife—even Matthews, the groom, who was, comparatively speaking, quite a new servant, having been with him for only ten years.

"Well, no doubt I can keep most of them about me," said the Major to himself, consolingly. "She will be sure to like my old servants."

Poor simple-hearted old boy. All that has been cut and dried for some time in the innocent mind of the guileless widow, and a discharge is ready and waiting for each and every one of them when the proper time comes. It is little you know of what takes place behind the dark eyebrows of fair-haired widows.

Filled with such thoughts, the Major arrived at last at the gate to Halliday Hall. It was here that another and still more terrible misgiving came over him: What if she wouldn't have him? What, indeed?

But this time the Major took his fence like the hard rider he was. He would soon find out whether she would or not, and he put Sobersides into a gallop up the long driveway.

"Yes, sir," said the footman, as he came down to take the Major's horse. Mrs. Hawtrey was at home. Would Major Barclay care to walk out in the Italian garden? She was there.

Major Barclay would be pleased to do so. It was just the place to say what he wanted to say.

He found her walking in the quaintly formal paths. The autumnal air was just a trifle too crisp to encourage sitting on the marble benches. He thought she looked charming in the light wrap she had thrown about her shoulders. And, best of all, she was alone.

The Major had struck his gait fairly now, and nothing could stop him. Figuratively speaking, he gathered his reins and steadied his horse for the next jump almost as soon as he had greeted her.

"I rode over to-day to ask you a question," he said, striking a close-trimmed yew savagely with his riding crop.

Mrs. Hawtry smiled, and turned those wondrous and wondering upraised eyebrows toward him, as if she didn't know it.

"Yes," he repeated, "I came to ask you if——"

"Oh, Major Barclay, listen," cried a fresh voice from the other end of the garden, "listen"; and all three stood for a moment in an attentive attitude.

The Major was annoyed at the interruption. Mrs. Hawtry only smiled, and bit her lip.

Then, as Beatrice Halliday came running toward them, they heard unmistakably the sound which she referred to. It was the short, sharp yelping of a pack of hounds hot on the scent, and it was drawing rapidly nearer.

"They are coming this way, Major," shrieked the delighted girl—Beatrice Halliday was as keen a sportswoman as Meadowthorpe boasted—"and you are not with them. The first day of the season, too. Oh, Major!"

Major Barclay looked somewhat shamefaced, but did not venture to reply.

"Look!" shouted Beatrice. "Over there on the hill! Don't you see him? There he goes!" and sure enough they could just see a small red object cross the field nearly a quarter of a mile away. Then came the hounds, fully three fields behind the little "thief of the world."

Major Barclay felt his blood stir in his veins.

"Bring Major Barclay's horse, quickly," called Beatrice to one of the house servants. "Hurry!"

Before the Major quite knew what he was doing he was on Sobersides' back and clattering down the hillside.

"The first meet of the season. You mustn't miss it," he heard Beatrice say as he scrambled into the saddle. Mrs. Hawtrey said so, too, though her fine irony was lost upon the Major. He meant to apologise for leaving so abruptly, but Sobersides had seen the hounds and took matters into his own hands—or rather between his teeth.

The Major's blood was up in earnest by this time. Hounds were running fast, but Sobersides was making great headway. Two fields away the rider saw some scarlet-coated horsemen, and presently he was close enough to recognise them: Bradbury the M. F. H., Tim the huntsman, young Tom Halliday, Ralph Goring, and the rest of the "first flight."

And what a run it was! Never in all his life had Sobersides fenced so magnificently or kept his pace so valiantly. He was a hunter in a thousand, thought the Major, and his owner was a lucky chap to own him. On they flew, over the hillside and down the other side, through a series of meadows which afforded excellent galloping, then over a ploughed field and through the grass again. Farmhouse after farmhouse rose up before them, and were left behind as they galloped mile after mile.

Reynard was making for the Barens, a desolate tract, where he thought he could save his brush. But it was still two miles away, and he had left a dozen behind him, straight as the crow flies. The yelping pack were gaining on him closely, and in another few moments they had viewed him.

The Major looked back. He was alone with the hounds. It was the sort of thing to tell one's grandchildren about. The Major had never seen a better run, nor known a happier moment. Suddenly the hounds fell upon the fox in the open and rolled him over, and in another moment the Major was down from

his horse among them, beating them off their luckless prey.

When Bradbury, Ralph Goring, and Tim the huntsman came up a few minutes later, they found the Major standing among the hounds, holding proudly aloft all that was mortal of the fox which had given them the best run of the season.

"Why, hello, Barclay!" said the M.F.H. "Where did you spring from? I thought perhaps you had given up hunting. Didn't see you at the club."

"No," answered the Major, "I was a little late. But when I give up hunting—well, you can give me up too, I guess."

Bradbury only smiled. But when some hours later the Major rode into the stable-yard of the little red cottage and Matthews' eyes lighted upon the brush dangling from Sobersides' head-stall, a smile of supreme contentment and relief came over that worthy's honest face. The Major had the best dinner that night he had tasted for many a day, and as Riggins took off his master's muddy boots to clean he whistled a cheerful tune softly to himself.

Later there was a jolly gathering of the "first flight" in the living-room of the little red cottage—Bradbury, Ralph Goring, Dick Middleton, and one or two others. And quite a lot of the Major's celebrated Scotch was consumed, and innumerable pipes were smoked, and the Major sang his great song—

"Bring me six brandies and sodas,
And set 'em all in a row;
Then bring me six jolly good fellows
To see a hard rider laid low."

And altogether they had a very good time indeed, as sportsman should after such a good day. But in the meantime the Major had despatched Matthews to Halliday Hall with a note which ran somewhat as follows:—

"My Dear Mrs. Hawtrey—As I said this morning, just before I left you so abruptly and so rudely—for which I trust you will pardon me—I rode over to ask you a question. It was this. I am going to give a little luncheon at the club to Grace Halliday and her fiance, the Earl of Dunmore, next Thursday. Will you not be good enough to grace the party as its chaperon?—Yours faithfully,

"GEORGE BARCLAY."

Among the many suggestions offered to account for the swift expansion of the nebulous rings surrounding Nova Persei, none seems more captivating to the imagination than that of Professor Kapetyn in a recent number of the "Astronomische Nachrichten," here he suggests that the phenomenon may be due to the echoing of light. At the probable distance of Nova Persei from the earth the observed velocity of the expansion exactly equals the velocity of light. That being so, it is only necessary to suppose the space surrounding the new star to contain scattered nebulous or meteoric matter, from which the light of the explosion that produced the star is reflected to us at greater and greater distances from the star as the light expands around it. It is like the reflection of the sound of an explosion taking place in a hilly country, and coming to our ears in a succession of echoes as it reaches more and more distant ranges

---

Out of 4,200 species of plants gathered in Europe for commercial purposes one-tenth have a pleasing perfume and are used in the manufacture of scents and soaps. The colour of 1,124 species is white, 187 having a perfume; 951 are yellow, 77 with a scent; 823 are red, 594 blue, and 308 violet, the number of these having a pleasant odour being 84, 34, and 13 respectively.

In the last three years, according to the "English Book Catalogue," there were published 178 editions of Shakespeare, 134 of Scott, 82 of Dickens, 40 of Alexandre Dumas, 38 of Thackeray, 27 each of Captain Marryat and Jane Austen, and 18 of George Eliot. Among living authors George Manville Fenn published 47 books, G. A. Henty 32, John Strange Winter and Miss Evelyn Everett Green 27 each, Rosa Nouchette Carey 26, and William Le Queux, Gordon Stables, and Mrs. Alexander 25 each.

NOTES ON IRISH WATER POWER
AND ITS ELECTRICAL DEVELOPMENT.

By W. TATLOW, M.A., B.E., Associate Member.

I.

The fact that no coalfields of any great importance exist in Ireland, and that in consequence fuel for the operation of steam or gas engines has to be imported at considerable cost, causes attention to be directed to the other possible means of obtaining motive power.

The utilisation of the water-power of the rivers naturally suggests itself first, owing to the great success which has attended the large electrical water-power schemes which have been carried out during the last few years, both in America and on the Continent.

The existence of water-power in Ireland has already exerted an important influence on the electrical industry, as undoubtedly the chief inducement to the construction of the Portrush and Giant's Causeway Railway, the first commercial electric line, was the possibility of obtaining the necessary motive-power from the waterfall at Bushmills, and it is probable that the Bessbrook and Newry Railway which was built very shortly after similarly owed its origin to the existence of the stream which provides the necessary power. It can, moreover, scarcely be doubted that many of the smaller electric light undertakings throughout the country, as for example at Galway, Killarney, Kenmare, Carlow, Bray, and Boyle, would never have been set on foot had it not been that water-power was available, and indeed to a certain extent already developed in the majority of these instances. Owing to the preponderance which electric lighting has had until quite recently over the other branches of electrical industry the importance of water-power for poducing electrical energy has been greatly under-estimated.

The demand on electric light stations being only for a few hours per day, the cost of fuel for working heat-engines may be a much less important factor than the interest on capital sunk in the development of water-power, together with the stand-by plant which it is often necessary to provide in cases of failure of the water-power owing to floods or drought. When, however, it is a question of the operation of railways or the driving of factories which require power nearly all through the day, and more especially when it is desired to supply electro-chemical works which run twenty-four hours a day all through the year, the advantage of water-power, when the necessary capital outlay is not abnormally great, becomes very conspicuous. This argument is borne out by the fact that on the Continent out of a total of 166,000 h.p. expended on electro-chemical work, 149,000 is obtained from water-power. The amount of labour required for the operation of a water-power plant should also be much less than for steam or gas plant of the same dimensions, and a less skilled type of labour will for the most part suffice, such as is required for the moving of sluices and the cleaning of straining racks.

Although at the present time the electro-chemical industry as a whole cannot be said to be in a very prosperous condition owing to the over-production of calcium carbide, yet there can be no doubt that electro-chemical processes will within a few years supplant many of the older methods of producing chemical products, as has already happened in the production of aluminium and potassium chlorate, and in the purification of copper, and, to a partial extent, in the manufacture of phosphorus, caustic soda, and bleaching powder; not to mention the large group of products which are only capable of being formed at the high temperature attained in the electric furnace, and in the manufacture of which there is no competition with an alternative method.

The water power of our rivers, when properly developed and controlled, will place Ireland in a position to compete in many of the chemical industries from which she was hitherto debarred owing to the large quantities of coal required for working the older processes. It is encouraging in this connection to reflect that we have already a chemical factory in Cork which produces high-grade chemicals of great purity, and even exports some of these products to Germany, as showing that the technical ability to carry out manufacturing work of this class can be found amongst our countrymen.

As regards the capital which it is permissible to spend on hydraulic works per H.P. developed, this depends on a large number of factors, such as the local cost of fuel and the fuel consumption of the class of heat-engine which could be used as a substitute, also on the load-factor of the demand for power, and on the reduction which the water-power might be subject to either from drought or from back water, so that each case must be considered on its own merits. The highest capital expenditure on the development of water-power appears to have been at Lyons, where it amounted to £84 per H.P. developed, and it is said to have been as low as £3 9s 3d., at Vallorbe in Switzerland, and even lower in Norway, so that an extremely wide range has been covered; nevertheless for the operation of electro-chemical processes requiring, as they mostly do, a large number of units per ton of product an expenditure at all approaching that at Lyons would be quite out of the question. At Niagara, where the capital expenditure was fairly moderate a horse-power is supplied to large users at the rate of £4 per annum, yielding a profit to those producing the electric energy; and electro-chemical industries are successfully carried on which buy their electric energy at this price, which amounts to 0.146 pence per unit if the supply is used continuously.

In considering this question it is important to notice that the capital expended on the development of a water-power in this country would be distributed chiefly among the labouring classes, giving employment which would help to retain and ameliorate the condition of the dwindling population, whereas an annual outlay on fuel is money sent directly out of the island.

It is necessary at this stage to endeavour to take stock of the water-power which can commercially be made available in Ireland either directly or by the aid of electrical transmission. The water-power of a country is dependent on the rainfall, the area of the surface, and its mean elevation above the sea level, and also on the nature of the soil. The rainfall varies considerably over Ireland, being greatest in the south-west and least on the east coast. It averages in Dublin about 30.9 inches, in Belfast 35 inches, Cork 40 inches, Sligo 42 inches, Killarney 53 inches. In mountainous districts it reaches higher figures, such as 83 inches in the Butter Mountains at the head of the Upper Bann, and it has been taken roughly to average 36 inches over the whole island; of this about one-third or 12 inches is carried down to the sea by the river system. Sir Robert Kane estimated the average elevation of the land surface of Ireland at 387 feet, and calculated fro mthat, together with the total area twenty million acres, and the assumption that one-third of the rain flowed away to the sea, the total physical water-power of Ireland at 1¼ million horse-power.

It is difficult to gain any idea of what pro-

portion of this quantity could be practically utilised, but a rough idea may be obtained if the actual condition of some of the larger rivers is examined, so as to discover what proportion the total fall which could be made available for working turbines on these rivers bears to the mean elevation of their catchment areas or to the mean elevation of the whole surface in absence of the above figure. The Shannon and the Erne may be taken as examples. Both these rivers flow many miles with a sluggish current and descend rapidly into the sea within a few miles; the Shannon descending 97 feet between Killaloe and Limerick, and the Erne 150 feet in five miles between Belleek and Ballyshannon. It is obvious that a large part of such fairly rapid falls is capable of development.

In the case of the Shannon it is proposed to use 40 out of the above 97 feet under the new Shannon water-power scheme, and it is possible that a further quantity of power might be developed at other parts of the river above Limerick. In the case of the Erne it is certain that at least 60 to 70 feet of fall could be utilised between Lough Erne and the sea. These facts would lead one to expect that, taking into consideration the falls available on the upper part of these rivers and their tributaries, a fourth part of the total mean fall could by suitable engineering works be made available. Admitting this, there would be an average of 300,000 H.P. available day and night all the year provided the whole discharge of the rivers could be economised.

The above figure would require to be greatly reduced owing to the fact that large quantities of storm water necessarily pass away unutilised, and it is doubtful if more than half of the total discharge of the rivers could be utilised unless special provision is made for the storage of storm water and the discharge of the latter during the period when the flow of the river is below its average value. In his paper on automatic sluices, Vol. XIX. Proceedings of Civil Engineers, Ireland, Mr. Dillon gives 0.488 cubic feet per acre per minute as the ordinary flood discharge in February of one of the rivers draining the central part of the island, and 0.08 cubic feet per acre per minute as the minimum discharge in September—these figures show the very wide range over which the discharge of the rivers varies, the ordinary maximum being more than six times the minimum flow, apart from the question of extraordinary floods which occur about once in ten years.

The quantity of water-power actually in use in Ireland in 1839 was 2,147 H.P., and to judge by the number of abandoned corn-mills to be seen throughout the country it is probably not enormously greater to-day. There would appear to be about 800 H.P. of water-power in use at present for public electric lighting purposes. There is, therefore, a great field still open for engineers and capitalists in regard to the development of our resources in this direction.

The practical question must now be faced as to how and where this power is to be made commercially useful.

There are several places such as Galway, Ballyshannon, and Ballysadare where the fall to be used is into the sea itself, and where the site is suitable for building factories such as electro-chemical works. Other falls, such as those on the Shannon near Limerick, and at the weirs on this river at Athlone and elsewhere, have the advantage of being situated on an extensive inland navigation in communication with the sea. A large number of places where power is available are not, however, so favourably situated, and it would be necessary to construct transmission lines to carry the power to the nearest town or to points on the railways or canals which were suitable for the establishment of factories.

When transmission lines of any great length have to be constructed, their first cost, maintenance, and difficulties as to way-leaves may often prove so serious that it would not be worth while to construct them unless a considerable amount of power was to be transmitted. These considerations seem adverse to the utilisation of many of our smaller rivers which do not yield more than, say, 50 H.P. at any point when the river is at average height. Very constantly, however, we find two or more natural falls or rapids in the same locality. In other places the rivers have been systematically laid out with weirs every half-mile or so, giving a fall of from 5 to 10 feet at each, by means of which corn-mills were formerly worked. In such cases it is quite feasible to gather up the power from the different points by means of a line running along the river bank, and then to transmit the sum total to a considerable distance if necessary.

This collecting system is just the converse of the ordinary system of distributing power from a central station; and having regard to the large scale on which the most successful modern factories of almost any kind are worked, and also to the large quantity of power required for electric furnace work, it is probable that much of our water-power will have to be dealt with in the above manner if it is to be used with the best advantage; and the same arguments would apply if it should ever prove economical to operate the railways of the country by means of electricity.

Great simplicity in the generating plant would be essential to the success of the above system, as specially skilled men could not be employed at a number of small generating stations, and it has suggested itself to the author that this difficulty could best be overcome, in the case of transmission by three phase alternating current, by using an ordinary three-phase generator in the more important power-house, and having three-phrase non-synchronous motors driven as generators in the smaller outlying generating stations. This would reduce the complication of these small stations, as there would be no exciters with brushes and commutators, and no accurate synchronising when starting up, the attendance being reduced to the lubrication of bearings, and the moving of the sluices and cleaning of straining racks. Some trouble would probably arise owing to sudden variations in the load, but this might be arranged for by means of artificial loads at the main power-house; and gradual alterations could be provided for by telephoning instructions to the attendants in charge of the auxiliary generators. As examples of places where some such a system of concentrating power would be suitable, one might point out the two adjacent falls on the Liffey at Poulaphuca and Ballymore-Eustace, the two falls at Colloney and at Ballysadare near Sligo, and the system of weirs on the Nore near Kilkenny.

The simplest application of such a system presents itself where a large factory on the banks of a river, deriving part of its power from water and the rest from steam, might gather in power from other points either up or down stream, and thus be able to dispense with the auxiliary steam-power. Unfortunately, there are in this country many more derelict mills than working ones, and cases where the above arrangement could be carried out are not infrequent. The tail races of these old mills are, however, as a rule, miserably small and shallow, and being as a rule carried beneath the building itself, it is both costly and dangerous to enlarge and deepen them. It will be found that this is one circumstance which greatly reduces the value of these old mills for power purposes.

As regards transmission lines, overhead wires of bare copper run on insulators would appear to be the right thing except in the immediate vicinity of towns, particularly as many of the lines would require to be made across country over bogs and streams where a cable would be out of question.

It would appear that under the existing rules of the Board of Trade an overhead line carrying more than 30 kilowatts cannot be made without special sanction, and should this be so it shows that rules which are found suitable in a thickly populated country such as England are very unsuitable here. It would, in any case, appear to anyone reading the rules and regulations affecting the development and transmission of electric power in Great Britain that these are much more numerous and stringent than those affecting other enterprises which really involve greater risk to the community, such, for example, as the construction of water works and gas works, and the carriage and storage of large quantities of coal and timber; and a person having no technical knowledge of the subject would naturally think, after reading these regulations, that the supply and use of electricity was a most dangerous business which, if it could not altogether be prevented by law, should at least be discouraged as much as possible.

Turning now to make a detailed examination of the system of rivers and lakes which drain the country, I would like at this point to remark that there appears to be a great need of a proper survey of our rivers, including both the measurement of falls at various points of their courses, and also the keeping of records of the water levels and discharges at all seasons, together with measurements of the rainfall over the catchments. Such information would not only be useful for the utilisation of the water-power, but also for determining the nature and extent of drainage works on which large sums are spent in this country from time to time. As an example, I may mention that the engineers who carried out the Erne drainage at a cost of £120,000 were greatly indebted to Mr. Porter, of Belleisle, county Fermanagh, who had kept daily records of the level of Lough Erne for many years.

It is possible that the local Constabulary might be employed at a small expense to keep such records, provided that proper scales were fixed in the rivers for reading the water levels from which the discharge might be computed by an expert, and each barracks might also be provided with its own rain-gauge. The information thus gained should be published from time to time in a form convenient for reference. At present there does not seem to be any published work on the subject of later date than Sir Robert Kane's book on the "Industrial Resources of Ireland," published in 1845. The collection and publication of such information might well be taken in hand by our new Department of Agriculture and Technical Instruction, which is devoting so much attention to the re-establishment of local industries.

The following list of our chief rivers, giving area of their catchments, is taken for the most part from Sir Robert Kane's book:—

River.	Area of Catchment. Total Square Miles.
The Shannon	4500
The Shannon (above Killaloe)	3600
The Barrow, Nore, and Suir	3400
The Erne	1580
The Foyle	1470
The Corrib	1370
The Blackwater	1220
The Moy	1030
Blackwater and Boyne	1080
The Slaney	815
The Lee	735
Blackwater (Armagh)	626
Liffey, Dodder, and Tolka	570
The Main	277
Ballysadare River	250
Ballinderry	166
Upper Bann	134

Assuming that twelve inches of rain flows away annually through the rivers, it will be found that the drainage of 13.7 square miles will give an average brake horse-power per foot of fall assuming that the turbine has an efficiency of 75 per cent.

The above efficiency is chosen both because it is well within the results obtainable with good turbines, and in larger installations with considerable fall it should cover the loss of conversion into electrical horse-power, and also because it corresponds with the simple and useful formula, that an acre flooded one foot deep can give one horse-power hour per foot of fall.

A calculation on these lines would make the

average flow of the Shannon at Killaloe equivalent to 260 H.P. per foot of fall.

It is important to note that the majority of our rivers have lakes of considerable size connected to them. (See table appended.) These

TABLE giving Levels and Areas of Principal Lakes, and Rivers through which they Discharge.

River	Lake	Level	Area in Acres.
Shannon ..	Allen	146	8,900
	Ree	122	26,428
	Derg	108	30.000
Erne ..	Lough Gowna	214	3,031
	„ Oughter	160	3,076
	Erne (Upper)	151	8,739
	„ (Lower)	150	27,645
Lower Bann ..	Neagh.. ..	46	96,000

Blackwater ..	Ramor.. ..	277	1,842

not only aid naturally in equalising the flow of the rivers and reducing the violence of floods, but they are also capable of being used in many cases as storage reservoirs in which storm water can be impounded, and discharged when the natural flow of the rivers is insufficient for power purposes. The greater the elevation of the lake, the greater its value in this respect. It has often been proposed by means of such natural or artificial reservoirs to store up the winter and midsummer floods and hold them over against the very low water which occurs in the rivers at certain seasons, generally in September, and thus to increase the minimum flow of the river.

This method of using reservoirs is based on the idea that the power of the turbines is to be limited to the minimum flow, which is a very wasteful arrangement, as during the greater part of the year much water will pass away unused. A better plan is to make the turbines sufficiently large to absorb at least the average flow, and to provide auxiliary steam, gas, or oil power if it is necessary to work at full power during dry seasons. Using the latter plan the storage reservoir should be drawn upon whenever the natural flow fell below the average, and this would permit of a much greater amount of storm water being caught and subsequently used with a reservoir of moderate size, as the latter would be partially filled and emptied many times in the year, and would be generally in a condition to impound water and reduce floods, which are nearly as objectionable to the mill-owner as to the agriculturist.

(To be continued.)

The reputation of Germany as a country where life is regulated as much as possible in accordance with the behests of science is borne out by the regulations of the German military authorities concerning the marching and physical training of troops. The "physiology of marching" has recently been the subject of careful investigation, and the results obtained are taken advantage of for the benefit of the German army. Among the conclusions reached is that during continuous heavy marching the rations supplied are not sufficient to replace the waste of carbohydrates, and that a day's rest is required after every three days' marching, to enable the body to recover its normal power.

When the model of the great extinct dinosaur called the triceratops, which was shown at the Buffalo Exposition, was in process of making, considerable difficulty was anticipated in sustaining the huge armoured skull in its proper position. But when the attempt was made there was no difficulty. Then it was found that nature, whose lines had been carefully followed in making the model, had so cunningly balanced the parts about the junction of the head with the neck that a single pin in the base of the skull sufficed to carry it.

THE IRISH LACE WORKERS.

(Lines suggested by a piece of lace wrought by an Irish peasant girl).

Some things there are enchanted—they stretch mysterious hands
To ours, and we, half-dreaming, follow their light commands;
Hearts throb o'er wayside blossoms, on breath of music rise,
And little shining star-rays make ladders to the skies.
In aisles of great cathedrals we walk with mitred Saint,
For all we see, of the unseen is but a phantom faint.
One low word spoken thrills us; we sigh o'er pictured face,
And I've beheld a vision in a piece of Irish lace.

O sun-crowned Irish mountain! O spirit-haunted hill!
O glen where angels wander (we call them fairies still),
No wonder, gazing on you, o'er flower-besprinkled plain,
She sought, with magic shuttle, to bind you in a chain.
She had no poet learning, yet as her bobbins flew,
The pattern she was weaving had poems woven through,
While all day long she laboured, with sunshine in her face,
And sunbeams getting tangled in the threads of Irish lace.

And still her white hand fluttered about the filmy thing,
The theme ethereal growing; and still the bird did sing.
Though sometimes want and sorrow, and cruel sacrifice
Seemed asking as an offering a young life's peerless price.
She breathed to it her troubles, her trials and her fears,
And it grew whiter—whiter—for it was bleached with tears,
The love of home and country—the valiant pride of race—
She wove them all together in this lovely Irish lace.

And in and out, upon the mesh, she wrought a thought divine,
Among the weaving tendrils of a softly clinging vine,
And here a modest primrose, for in the primrose time
She thought her very heart-beats were set to ringing rhyme;
And now it was a shamrock, but holy was this leaf,
She crossed herself devoutly with act of firm belief;
The angels smiled upon her, a smile of tender grace,
And counted all the stitches in this holy Irish lace.

O light and fragile fabric, thou still hast strength to steer
Thy message o'er the ocean to those that greet thee here.
We read, along thy tracing, that true and honest art
Still lives, with pulses throbbing, within the Irish heart;
We feel the subtle presence of a spirit like our own,
The fragrance of the primrose has not entirely flown;
And through thy slender fibre methinks that I can trace
A golden thread of kin-love in our own dear Irish lace.

God speed thee on thy mission! Go, cast thy flower-gemmed net,
And capture hearts, and bind them; the world must know thee yet.
Appeal to the art-lover, the generous allure;
Go, turn thy foamy whiteness to bread for Irish poor;
Annunciate the future—the sweetness of thy tone,
Like viol music trembling, will reach heart-depths unknown;
As sun through May-mists shining, Irish genius, Irish grace
Look through thy veil with burning eyes, O priceless Irish lace!

Montreal, M. Guerin.

SCIENTIFIC TOPICS.

An American company has secured concessions for the operation of many European canals by electricity. Altogether 5,000 miles of canals are controlled in England and on the Continent.

✧ ✧ ✧

The German Emperor has offered a prize for a motor car suited for the purposes of the farmer. The award will be made some time next year by the Emperor himself.

✧ ✧ ✧

Figures compiled in Paris show that 82 per cent. of the road accidents in France are due to horse-drawn vehicles, 8 per cent. to railroads, 5 per cent. to bicycles, and 5 per cent. to automobiles.

✧ ✧ ✧

It is said that Fournier, the celebrated French chauffeur, received 50,000 dollars for the use of his name alone, without services, in the recent incorporation of an American company bearing his name.

✧ ✧ ✧

An oil well on the ground which is rented from the Crown in Russia, for 5 kopeks a pood (1 2-3d. per 36 lbs.) by the Baku Naptha Company, started gushing at the rate of a million poods daily. Work was stopped owing to the fear of a conflagration.

✧ ✧ ✧

Copper or lead in small amounts can be removed from mercury by putting it under warmed diluted nitric acid, stirred at intervals of one half-hour for four hours. Lead in larger quantities is removed from mercury by retorting, the mercury being covered to the depth of about one and one-half inches with powdered charcoal.

✧ ✧ ✧

The artesian well at Grenelle, Paris, took ten years of continuous work before water was struck, at a depth of 1,780 feet. At 1,259 feet over 200 feet of boring-rod broke and fell into the well, and it was fifteen months before it was recovered. A flow of 900,000 gallons per day is obtained from it, the bore being 8 inches.

✧ ✧ ✧

A project is on foot to make gas near coal mines and pump it 124 miles to Paris. It would be sent highly compressed, and the pressure would be reduced for consumption. It is expected if this project is carried out, that gas can be supplied for something over 1s. 2d. per 1,000 cubic feet to the city, 2s. 4¾d. for private lighting, and 1s. 5¼d. for use as fuel.

✧ ✧ ✧

Dr. Hrdlicka has started on his fourth expedition into the country of the cliff-dwellers and Pueblos in the south-western part of the United States and northern Mexico. These trips are made under the auspices of the American Museum of Natural History, the money being supplied by F. E. Hyde, Jr., of New York.

✧ ✧ ✧

The Society for the Study of Electric Railways of Germany has been carrying out a remarkable series of speed trials upon a new electric railway. The speed attained varied from 100 to 105 miles an hour. While running at the latter speed the pressure was found to be equal to a wind force of 12 feet per second, a force which has only been registered once on the German coast, in the hurricane of February, 1894. The engineers of the railway are confident that even much greater speed can be attained.

✧ ✧ ✧

A wireless telegraphic installation is being made on the Zugspitz, the highest summit in Germany, and the postal station at Ebisee at its base. The altitude of the observatory is nearly 2,290 yards above sea level. The station will be very important, as the meteorologist who occupies it is completely cut off

during the winter months, and telephonic communication cannot be depended upon, owing to the liability of the cable being frayed by coming in contact with the sharp edges of the rocks. The Slaby-Arco system of wireless telegraphy will be used.

✧ ✧ ✧

M. Sibillot, a Parisian æronaut, has devised a new principle of ærial navigation, which, he anticipates, will solve the problem of travelling through the air. He has completed the plans of a new dirigible balloon which, he maintains, will be manageable in any weather. He proposes to carry in his ærial machine a refrigerator and a heating apparatus. By simply pressing a lever of the former he thus reduces the temperature of the gas, the condensation causing the balloon to descend. On heating the hydrogen the gas expands, and thus the balloon ascends. By this alternative heating or cooling of the gas in his balloon he can rise or fall at will without allowing any of the hydrogen to escape.

✧ ✧ ✧

Purdue University will soon inaugurate a new departure of instruction in telephonic engineering. This step is taken in response to the increasing demand by telephone interests for men trained in the particular branch of electrical engineering pertaining to telephony. Investigations have disclosed the fact that students completing the course in electrical engineering must devote upwards of two years additional work in acquiring special details of telephone practice before they are sufficiently equipped with a knowledge which is valuable to merchants and consumers of telephone material.

✧ ✧ ✧

The French Government is seeking to devise a method of economising the cost of its system of lighthouse lighting, since it is considered that this department is too expensive. In 1873 the best French lighthouses were illuminated by mineral oil, and the most powerful light equalled 54,000 candles. In 1883 the electric light was introduced, by which means the illuminating power was greatly increased. In the case of Calais lighthouse the illumination was increased to 820,000 candles. At the present day, owing to the rapid progress maintained in connection with lighthouse illumination, a light equal to nearly 3,000,000 candles is produced, and which is capable of piercing fog.

✧ ✧ ✧

More than a thousand mummies of birds sent from different parts of Egypt by Prof. Maspero have been opened at the Lyons Museum. A considerable number of these contained only the remains of very young birds, debris of feathers and bones, but it was possible to obtain and study the skeletons of more than 500 birds, which were well preserved. Some of these were in such a perfect state of preservation that they were recognised by a simple examination of the feathers, but most of them were determined after the skeleton. The mummies form two classes of a distinct appearance. The first includes the ibis, and the second the birds of prey. The mummies come from the tombs of Sakkarah, Roda, Kom-Ombo, Gizeh, and others. At Kom-Ombo they are of the Roman epoch, and at Gizeh of the Ptolemaic.

✧ ✧ ✧

Dr. M. Ekenberg, of Gothenburg, has made a discovery which will be of importance in dairy farming, says Consul R. S. S. Bergh. He claims to have invented an apparatus by which milk can be brought into the form of powder, like flour in appearance, but possessing all the qualities of milk in concentrated form, moisture excepted. It is said that this milk flour is completely soluble in water, and can be used for all purposes for which common milk is employed. The milk flour does not get sour, does not ferment, and in the dry state is not sensitive to changes in the weather. It can be kept and transported in tin cans, barrels, bags, etc. The cost of production Dr. Ekenberg has estimated at about 1s. 1½d. per 16 quarts (1 ore per liter), and he thinks that flour made from skimmed milk can be sold for about 6½d. per pound (1 krone per kilogramme).

✧ ✧ ✧

Mr. Edward Dodson, an English explorer, has recently returned from a prolonged sojourn in the great desert of Tripoli, North Africa. This portion of the country has never been thoroughly explored, and, indeed, has not been visited by a European for over fifty years, so that Mr. Dodson's results are of inestimable value. One of the greatest achievements of the expedition was the exploration of the great petrified forest of Murzuk. Throughout this whole area, which extended for several miles, petrified trees were found, varying in circumference from seven feet to a few inches. Every branch of this forest was, of course, lying prone, and this together with the presence of marine shells, showed that this part of the Great Sahara had at one time been submerged. On one occasion the party passed through a strange experience. They were surrounded with thunderstorms. No less than five distinct storms were in progress all round, and the guns and spars of the party became surrounded by a halo of phosphorescent light.

✧ ✧ ✧

Some interesting experiments for the artificial production of rain by means of electricity have been carried out in Japan. The probability of greater success being obtained by this means, in lieu of the system of detonating explosives in the upper air strata, has often been advocated by scientists. This attempt by the Japanese, however, is the first practical effort to prove the truth of this theory, and it was attended with conspicuous success. The trials were made in the Fukushima prefecture. Operations were commenced at eleven in the evening, but there was no sign of atmospheric change until nine o'clock next morning, when a cluster of clouds were observed over the hill on which the experiment was held. At length rain began to fall, followed by a second fall at 11 a.m., and afterwards a third, fourth, and fifth—the last being about 9.30 in the evening. The area upon which the rain fell extended over many miles. As a single experiment of this description is scarcely conclusive, the scientists who carried out these particular trials propose to repeat them, with a view to establishing the feasibility of the idea.

✧ ✧ ✧

Experiments to determine the liability of liquids and compressed acetylene to explode were tried recently at Berlin. Several cylinders loaded with 4 kilos of liquid acetylene were placed in position, with a valve at the top. The gas which collected at the upper part of the cylinders was under a pressure of 725 pounds per square inch. A cartridge containing one kilo of picric acid was then applied and exploded by electricity, with the result of blowing off the top of the cylinder, but the acetylene was not detonated, and the cylinder emptied itself on the gaseous acetylene. Another cylinder was charged with 3½ kilos of liquid and a 200-gramme cartridge placed in the bottom; when the electric current passed through into it the liquid acetylene exploded, destroying the cylinder. A cylinder of liquid acetylene was fired at with a rifle without explosion resulting, neither was a cylinder of acetylene disturbed by the explosion of a quantity of picric acid close to it. The experiments proved that acetylene is undisturbed by sympathetic discharges, but that the liquid will explode always if a detonator is in contact with it.

✧ ✧ ✧

The Egyptian Exploration Fund has accomplished remarkable results in connection with the operations at Abydos. During the past year the association has completed the most important historical work that has ever come into its hands. The continuous order of seventeen kings has been established, and the foundations of Egyptian history have been settled in a manner that had hitherto been deemed beyond hope. The excavations at Abydos have provided the only contemporary history of the time, and completely vindicated the historical character of the lists which had been preserved by later ages. The historic character of Mena is substantiated, and the long line of a dozen kings back to Mena is rendered clear. The Egyptologists have seen and handled the gold, the crystal, the ivory, with his name and engravings; and even kings that went before him are now better known by actual objects than one-half of the Saxon kings of England. No such complete materialisation of history has ever before been obtained at one stroke from any other country or age. There remains to be examined at Abydos the great temple site, one of the most ancient and promising spots in that land of buried treasures.

✧ ✧ ✧

The Paris municipal authorities are paving several streets with glass. About twelve months ago the inventors of this process were accorded permission to lay down their glass pavement in certain thoroughfares on condition that, should the new material not be found to answer at the expiration of a specified time, the streets thus experimented upon were to be repaved in the old style at the inventors' expense. The paving has evidently given satisfaction, since the Municipal Council is laying down the glass in several of the busiest thoroughfares of the city. The vitreous paving-stones are made of powdered glass, which is baked until it becomes almost fluid, then compressed by hydraulic machines, and cut into cubes to facilitate the laying process. The chief objection against the glass pavement is that its surface offers no grip to horses' hoofs, which would render it very slippery in wet weather, but results have proved that no greater danger is to be feared with this material than with the ordinary asphalt paving.

✧ ✧ ✧

The work of raising the Great Monolith at Stonehenge has enabled archæologists to form a more reliable estimate regarding the epoch in which these druidical monuments were erected. There has hitherto been much controversy on this point, certain authorities clinging to the assertion that it was built in Roman times, while others contend that it was erected during the bronze period. While making excavations round the monolith for the concrete bedding, a large number of neolithic stone implements were unearthed that show every sign of having been used to cut and to square the stones. They all bore marks of hard working, and when of no further use for cutting, the stones had been apparently thrown aside and afterwards used to make a bedding to support the uprights. Experts, therefore, now entertain little doubt that Stonehenge was built in the neolithic age, for had it been built in the bronze or iron age, bronze or iron tools would have been used. Although leading authorities do not quite agree as to the actual date of the introduction of bronze into Britain, it is generally conceded to have been about 1,500 B.C. It is consequently apparent that Stonehenge must have been constructed at some period considerably previous to that date.

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1793.)

MARCH 19.—The disagreeable affair in which Mr. J. N. Tandy is at this time engaged having been variously and erroneously represented, we think it our duty to present our readers with the most authentic account of it we have been able to gather.

At the Louth Assizes held last week in Dundalk, bills of indictment were found against Mr. Tandy for having, some time since, published, or dispersed, a printed paper hand-bill, entitled, "Common Sense" (no part of Paine's pamphlet, of the like name, published in America during the late war), said to contain seditious matter. In consequence of this a Crown warrant was, on Wednesday last, served on Mr. Tandy, and being brought before Lord Clonmel, he entered into recognizances to abide his trial at Dundalk, himself in one hundred pounds, and two sureties in fifty pounds each.

The next day Mr. Tandy, accompanied by his attorney, Mr. Dowling, departed for Dundalk, and arrived thither early on Friday last, on which day we have not learned, with any degree of certainty, whether Mr. Tandy appeared in the court, then sitting; but that on an intimation given him, as we are informed, that the proceedings against him were likely to assume a very ferocious complexion, he thought it prudent, for some time, at least, to withdraw himself from the danger of the prosecution; to which step, we are also told, he was further induced by a rumour, that other bills of indictment, containing charges of a much more dangerous kind, had been preferred to the Louth jury against him, which having no previous knowledge of, he was not prepared to meet.

Mr. Tandy having thus withdrawn, the recognisances were, of course, estreated. If any further procedure on this occasion takes place, the public will, no doubt, be soon informed of it.

Counsellor Grady died yesterday morning. The wound he received last Monday night in Park street, from the ruffians who stopped him, and fired at him before he could deliver his purse was the occasion of his much lamented death.

Twelve of the Defenders have been condemned to death in Dundalk; two of them suffered the day they were convicted.

At Trim five have been executed, and thirty-five remain to be tried. The assizes are adjourned to the 17th of April.

DUNDALK SPRING ASSIZES.

Drogheda, March 16.—Monday the Hon. Mr. Justice Boyd and the Hon. Mr. Justice Downes opened their respective courts, swore the grand jury, and adjourned, without proceeding on any material business till next day.

Wednesday.—Peter M'Bride, Thomas Dowdall, and James Flinn were tried, under the Whiteboy Act, for entering Lord Clermont's house, at Clermont Park, near Dundalk, and taking firearms thereout; they were all capitally convicted, and received sentence of death.

The trial was not over till near seven o'clock, and M'Bride was executed at nine. Dowdall and Flinn were ordered for execution on Thursday. When these unfortunate men were brought out in order to be executed, Flinn formally declared Dowdall to be innocent of the robbery, and through the humane interference of the Right Hon. the Speaker, he was respited.

James Plunket was found guilty under the same act, for taking arms from Charles Craven, Esq., of Drumcashel, and received sentence of death.

George M'Daniel, found guilty of administering the Defender's oath, was ordered to be transported for life.

Bryan Smith, Charles M'Ardle, Bryan M'Clerney, John Kirk, and Matthew Gregory, were found guilty before Counsellor Caldbeck, under the Whiteboy Act, and received sentence of death; also, Arthur Boyle, Patrick Bolard, and Lawrence Halfpenny, found guilty of robbing the house of Mr. Coburne of firearms, received sentence of death, and ordered for immediate execution.

Friday.—Thomas Rath, Samuel Slator, and John Dungan were tried for robbing his Majesty's mail near Flurry Bridge; Rath pleaded guilty; Sleator and Dungan were capitally convicted on the evidence of James Devitt and — Quinn, who were admitted approvers on the part of the Crown.

Same day twenty-one men were tried for administering unlawful oaths, sixteen of whom were convicted and sentenced to be transported for seven years.

The court was sitting at seven o'clock on the trial of John Gimor, Thomas Keenan, and John Cunningham for robbing John Flanagan, near this town, on the 23rd of February last.

Sixty merchant ships, under the convoy of two frigates, from London down Channel, having lain to, in the night of the 14th of last month, under the Isle of Wight, two French privateers stole in among them, and took several by boarding them.

It is with great concern we learn, by a letter from the master, that the Charlotte Campbell, from London to Belfast, was one of the unfortunate number, and carried, with others, into Havre-de-Grace. The loss of this ship and cargo is estimated at about fourteen thousand pounds.

A letter from Trim says that on Thursday two of the Defenders were tried and capitally convicted. The court sentenced them to be hanged that evening; they were accordingly taken from the dock, and, after a few hours preparation, executed. These unhappy sufferers were the only Defenders yet tried.

The Irish lottery has been contracted for by Mr. Cope, of London, the only candidate on the occasion—the price £6 0s. 3d. The same gentleman contracted for the last Irish lottery.

Last night the "Rivals" was performed at the new Private Theatre in Fishamble street, to a brilliant audience of rank and fashion.

WOMEN

Miss Campion, Mrs. Dawson, Mrs. Garvey.

The house looks splendid from the grandeur of the decorations, which are white and gold. The drapery over the boxes is white satin, with gold fringe.

A beautiful scene is used by way of curtain; upon it is painted Apollo's lyre, with sprigs of laurel and oak, ornamented with a glory, in a most pleasing-coloured sky. The motto is: "For our Friends." The servants' liveries are elegant—brown coats, richly laced with silver down the seams, laced scarlet waistcoat and small-clothes, and their hairs dressed, with bags.

MARCH 28.—Yesterday Dr. Reynolds, of Cookstown, in the North, summoned to appear before the Secret Committee of the Lords, was committed, by the House of Peers, to Kilmainham jail, the county prison, for refusing to answer interrogatories from the Secret Committee.

Same day a numerous assemblage of people surrounded the house of an inhabitant of Dame street, led thither by reports that the owner had locked up three of his children in the upper apartment; and that, in consequence of his severe treatment, in denying them necessary food, etc., one had died. To obviate those unfavourable impressions, the children, three females, were exhibited at the windows during the whole of the day, and a guard placed at the door to prevent the irregularities of the multitude.

APRIL 4.—Yesterday Abraham Wilkinson, Esq., was elected Governor of the Bank of Ireland, and George Godfrey Hoffman, Esq., Deputy-Governor, for the ensuing year.

Tuesday night the Right Hon. the Lord Chancellor sailed for England.

A Commission has passed the seals, appointing his Grace the Archbishop of Dublin, the Right Hon. Lord Clonmel, Chief Justice of his Majesty's Court of King's Bench; and the Right Hon. Lord Carleton, Chief Justice of his Majesty's Court of Common Pleas; to act as Commissioners during the absence of Lord Fitzgibbon, Chancellor of Ireland.

Last Friday Mr. C——, of Beresford street, cabinet-maker, respecting whose fate his friends for upwards of one month past, have been exceedingly uneasy, returned almost unexpectedly among them. The singular adventure which had befallen him he thus recited:

About the time above-mentioned, he had spent an evening in St. Mark's parish, at a house where he had been kept to a late hour, he thinks between one and two in the morning. As he passed one of the lanes leading from Fleet street to Aston's quay, he was accosted, first by one, and afterwards by four other men, in tailors' habits, whose words and manners were, in the first instance, tolerably courteous; but on a sudden they seized him, put a handkerchief on his face, and threatened destruction in case of noise or resistance, and dragged him to the water side, to a boat they seemed to have ready for the purpose, into which they forced him, having previously emptied his pockets of their contents, being eight guineas and a half.

They then rowed down the river, and boarded a small vessel, in the hold of which they put him, after securing his legs and arms with ropes. In this dismal place he found eight or nine men in the same plight, who had been kidnapped much in the same manner he had.

In some days after this vessel, whose description or destination Mr. C—— was never permitted to ascertain, set sail. The next day, he thinks about the 21st or 22nd of March, it blew a furious tempest, that drove the vessel on shelves, that made her destruction inevitable. The barbarous crew then, coming into the hold, informed the captives of the danger they were in, and cut the cords which bound them. The vessel, which Mr. C—— now perceived to be a sloop, went to pieces; he, however had the good fortune, with three others, to get on shore on a part of the wreck. The place proved to be Cardigan Bay, from whence, when he was able to travel, he has returned to his friends.

(To be continued.)

"MR. WALTER COX ON THE PILLORY."

From the "Irish Magazine and Monthly Asylum for Neglected Biography," for April, 1811.

In his extraordinary periodical, the "Irish Magazine and Monthly Asylum for Neglected Biography," for April, 1811, "Watty" Cox thus described the scene depicted above:—

On Saturday, the 9th of March, this daring culprit, agreeable to the sentence pronounced on him, by Lord Norbury, was conducted from Newgate to the Royal Exchange, where the pillory was prepared for his punishment. On his appearance on the machine, he was cheered by a numerous and respectable assemblage of his fellow Citizens, not less than twenty thousand persons; this honourable expression of the public feeling in his favour, so dissimilar to the putrid opinion of a sorted Jury, gave him confidence, and tended to restore him to his spirits, which suffered a temporary dejection, from the mode of public exposure, intended to fix infamy upon useful labours and honourable industry; and by debasing Mr. Cox, in the eyes of his country, would have the effect of putting public opinion, and the country

itself, into the hands, and under the management, of an English Secretary, an hired Press, and a pensioned Bar.

Webb, in his "Compendium of Irish Biography," says:—

Walter, or "Watty," Cox, the son of a Westmeath blacksmith, a hanger-on of the revolutionary party in 1798, was born about 1770. He proved faithless both to his own side and to the Government. In 1797 he established the "Union Star," nominally in the interests of the United Irishmen, but ultimately repudiated by the Directory. After a visit to America, he established his "Irish Monthly Magazine," a medley of truth and falsehood, in which are to be found some valuable biographical details of many distinguished persons of the period. He carried it on from 1808 to 1815, being subjected to numerous fines and imprisonment for opinions expressed therein. He is said to have ceased writing upon the receipt of £400 in hand and a pension of £100 a year, withdrawn in 1835. He died at 12 Clarence-street, Dublin, in poverty, on the 17th January, 1837, aged 66. Some years before his death he had tried to cut the head off King William's statue in Dublin—relinquishing the task upon finding his tools unsuitable for the purpose. Mr. Madden writes: "The turbulence and restlessness of this man's mind never suffered him to be quiet, or to persist in any pursuit. While he was in America, he had tried all sorts of trades and callings; he had been a newspaper editor, a pawnbroker, a chandler, a dairy-keeper, and a dealer in Irish whiskey—and in all was unsuccessful."

TO THE OCEAN.

WRITTEN AT DUNMORE EAST.

Thou glorious ocean! sure I feel
In adoration I could kneel
And worship thee!
Only such homage may not be
To other save the Deity.

Say rides He not upon thy waves,
With tempests for His chariot slaves,
Sweeping o'er thee;
And when His forked lightnings gore thee,
Sink not all human things before thee?

Does not thy ceaseless rolling tide
Loud speak, as if with heaven allied—
Eternity!
Is there, could silent gaze on thee,
Nor feel thine awful Majesty!

An emblem, too, thy waves upcurled,
Of the friendship of the hollow world,
Which, though twining
Round us in fortune's bright beams shining.
Proves cold and dark when in sorrow pining.

Methinks thy calm and gentle billow,
Might for the weary form a pillow
Of peace and rest:
Where, not by care nor grief opprest,
They might sweetly dream of worlds more blest.

H. C.

Tokio, in Japan, has been destroying rats wholesale as a preventive measure against the plague. This disturbed the religious scruples of Umataro Nagai of Akasaka-ken. To get rid of his scruples he is building a stone pillar, 12 feet high and 6 feet thick, in honour of the spirits of the killed rats.

THIRTY HISTORIC IRISH-AMERICAN FAMILIES.

A BRILLIANT RECORD.

PART II.

THE PORTERS, OF PENNSYLVANIA.

Few American families have attained a greater degree of fame than the Porters, of Pennsylvania. Robert Porter came from Ireland in 1820, settling in New Hampshire, and afterward removing to Pennsylvania. His son, Andrew, was appointed a captain of marines by Congress, and assigned to the "Effingham." He was subsequently transferred to the artillery, at length becoming colonel of the Fourth Pennsylvania regiment of that branch of the service. He participated in many battles, including Princeton, Brandywine, and Germantown. President Monroe offered him the position of secretary of war, which he respectfully declined. His son, David R. Porter, was governor of Pennsylvania. nother son, George Bryan Porter, became governor of Michigan. A third son, James M. Porter, was a volunteer in the war of 1812. David R.'s son, William A. Porter, was judge of the supreme court of Pennsylvania, and a judge of the court of Alabama claims. Another son of David R.'s was Horace Porter, who was made brigadier-general during the Civil War. George Porter's son, Andrew, rendered good service in the Civil War, and became brigadier-general of volunteers and afterward provost-marshal general of the army of the Potomac.

THE THOMSONS, OF PENNSYLVANIA.

Charles Thomson, who was styled "the perpetual secretary" of Congress, was a native of Maghera, Derry. He and three brothers were brought from Ireland in 1740, by their father, who died just before reaching land. An elder brother had arrived before them. Charles became, at an early age, a firm supporter of the people's rights, and vigorously denounced British despotism. He was a man of the strictest integrity and sense of honour. John Adams spoke of him as "The life of the cause of liberty"; the Indians referred to him as "The man of truth." He was chosen secretary of the first Continental Congress in 1774, and retained the position until 1789, when he resigned. He died in 1824, in Montgomery county, Pennsylvania. He was among the first signers of the Declaration of Independence. His brother, William Thomson, was also a native of Ireland. Soon after reaching America, he went to South Carolina. At the breaking out of the Revolution he commanded the Third South Carolina Regiment, and saw much service. He took part with D'Estaing and Lincoln at the attack on Savannah, and met and defeated Gen. Robert Cunningham. He was formally thanked by Gov. Rutledge and by Congress.

THE KEATINGS, OF PENNSYLVANIA.

The Keatings alluded to here were of Franco-Irish descent. The progenitors of the family were exiled from Ireland by British despotism. Rendering valuable services, they were ennobled by Louis XVI. Baron John Keating was a colonel in the French army. At the beginning of the American Revolution, he resigned his commission, settled in Wilmington, Del., and subsequently removed to Philadelphia. His eldest son, John, was a lawyer of prominence, and married a grand-daughter of Francis Hopkins, signer of the Declaration of Independence. Another son, William, became a professor in the University of Pennsylvania, and was geologist and historiographer of Long's second expedition in 1823. William had a nephew, William Vincent Keating, who was an eminent physician in Philadelphia. He became professor in Jefferson College, and during the Civil War was a medical director in the army. Another member of the family, John W. Keating, was also a physician of note, and an author of much ability.

THE BUTLERS, OF PENNSYLVANIA.

Richard Butler, a distinguished soldier of the Revolution, left Ireland, with his parents, some time before 1760. He was commissioned lieutenant-colonel in the famous Pennsylvania Line at the beginning of the Revolution. He subsequently rose to the rank of major-general. His brother, William, was also an officer in the Revolution. Thomas, another brother, received the thanks of Washington, at the battle of Brandywine, for his gallantry, and Gen. Wayne overwhelmed him with thanks, at Monmouth, for a like reason. His son, Thomas, was assistant adjutant-general in the army under Gen. Harrison, and distinguished himself at New Orleans. Percival, the fourth of the Butler brothers, was a captain in the Revolution, and adjutant-general in the war of 1812. His son, Thomas L., was an aide-de-camp to Jackson at the siege of Pensacola and at the battle of New Orleans. Another son, William O., also did good service at New Orleans, and in the Mexican war. During the latter struggle, he served under Taylor and Scott, and received a sword of honour from Congress. Edward, youngest of the five brothers, was a captain in Gibson's regiment of levies, 1791, and adjutant-general to Gen. Wayne in 1796. His son, Edward G., became a colonel of dragoons in the Mexican war.

THE McKEANS, OF DELAWARE.

William McKean arrived from Ireland in the beginning of the eighteenth century. His descendant, Thomas, was a member of the Delaware assembly, and continued in the position for eleven years. He was held in very great esteem, and both Delaware and Pennsylvania claimed him as a citizen. He became judge of the court of common pleas, and was a member of the

Continental Congress in 1776. He signed the Declaration, and was elected president of Congress in 1781. During the session of 1776, Mr. McKean was a member of the secret committee appointed to contract for the importation of arms. A few days after the Declaration was issued, he marched at the head of a battalion of troops to join Washington. He died at Philadelphia, after having been chief justice of Pennsylvania, in 1817. His son, Joseph Borden McKean, was attorney-general of Pennsylvania. Joseph's son, William W. McKean, was a naval officer, and after many years faithful service was retired with the rank of commodore. During the Civil War he was in command of the Western Gulf blockading squadron.

THE CAMPBELLS, OF VIRGINIA.

William Campbell was a native of Virginia, where his father, an Irishman, had settled. After his father's death, in 1767, he removed with his mother and sisters to the Holston valley. He was made a colonel of the Continental army in 1780. With his regiment of riflemen he performed brilliant feats. Washington, Gates, and Greene highly commended his great ability, and expressed their high sense of his gallantry. Colonel Campbell assisted Greene at the battle of Guilford Court House, and was promoted to brigadier-general. He served with Lafayette in several battles. Gen. Campbell's nephew, John B. Campbell, entered the Nineteenth Infantry in 1812. In the war with Mexico he was elevated to the rank of colonel.

THE BURKES OF VIRGINIA.

John D. Burke came from Ireland, and was of the same family as the great Edmund Burke. John arrived in America about 1796. He engaged in journalism in Boston, and afterward in New York. He published a tragedy entitled: "Bunker Hill"; also a History of Late War in Ireland (Philadelphia, 1799); a History of Virginia (1804), and other works. His son, John, was born in Virginia in 1800, and died in 1888. He was a graduate of William and Mary College, a lawyer of note, and became a judge of the Louisiana courts. His memoirs have been published.

THE BURKES, OF NORTH CAROLINA.

Thomas Burke, the progenitor of the family in America, was born in Ireland in 1747. He arrived in 1764, and studied law. In 1774 he removed from Virginia to Hillsborough, N.C. He became a leader among the colonists, and was bitterly opposed to the Stamp Act. He was a member of the Provincial Congress in 1776, and served as a volunteer at the battle of Brandywine. He was subsequently elected to the Continental Congress, and retained his seat for several years. In 1781 he was made governor of North Carolina.

THE JACKSONS, OF NORTH CAROLINA.

The elder Andrew Jackson emigrated from Carrickfergus, Ireland, in 1765. He had three sons, Andrew, Hugh, and Robert. Andrew was a soldier in the revolution, and in the second war with England. His most glorious achievement was the brilliant victory he won at New Orleans in 1815. He became successively, public prosecutor of the western district of North Carolina, district attorney of Tennessee, member of Congress, United States senator, justice of the supreme court of Tennessee, major-general in the regular army, governor of Florida, and was twice President of the United States. His adopted son, Andrew Jackson, had a son who was also named Andrew Jackson.

THE RUTLEDGES, OF SOUTH CAROLINA.

Dr. John Rutledge went to America from Ireland in 1735. His son, John, who afterward became so distinguished as a patriot, accompanied him, as did also another son, Edward. John, Edward's brother, was appointed commander-in-chief of the South Carolina forces in 1776. In 1779 he was chosen governor. In 1791 he was chief justice of South Carolina. In 1796 he was made chief justice of the United States. Edward Rutledge was one of the signers of the Declaration. Like his brother, he was a member of the Continental Congress, and during the war rendered conspicuous service. He became a United States senator, and in 1794 was governor of the state, as his brother had been before him.

THE LYNCHES, OF SOUTH CAROLINA.

Thomas Lynch arrived from Ireland long before the Revolution, and settled in South Carolina. His son, Thomas Lynch, strongly advocated the cause of the colonies, at an early age, and was a member of the first Continental Congress. His son, the third Thomas, was appointed captain in the First Regiment of South Carolina, and did good duty in the field. He succeeded his father in the Continental Congress, and was a signer of the Declaration of Independence.

THE CALHOUNS, OF SOUTH CAROLINA.

James Calhoun came from Donegal, Ireland, in 1773, and at first settled in Pennsylvania, subsequently removing to Virginia and South Carolina. He had a large family, one of whom was Patrick. The latter in the course of time became captain of a battalion of frontier rangers, and rendered good service against the Indians. He married Martha Caldwell, of Virginia, the daughter of an Irish settler. When Calhoun entered Congress, war was imminent with England. In 1817 President Monroe appointed him Secretary of War, and in 1824 he was elected Vice-President of the United States. In 1828 he was re-elected Vice-President, and in 1843 was acting Secretary of State.

THE BURKES, OF SOUTH CAROLINA.

The best known member of this family was Ædanus Burke, the great jurist. He was born in Galway, Ireland, in 1743, and emigrated about the beginning of the Revolution. He volunteered in the American army, and rendered efficient service. He became a judge of the state courts in 1778, was elected to congress, and became chancellor of the state.

THE MOORES, OF SOUTH CAROLINA.

The elder Moore, James, was born in Ireland in 1640. He died at Charleston, S.C., in 1729. He left Ireland when twenty-five years of age. He was a man of extraordinary force of character, and was a natural leader of men. He had ten children. Ever foremost in all matters that were likely to contribute to the public welfare, he became governor of South Carolina in 1700. His sons, Maurice and James, fought the Indians in colonial times and displayed great bravery. Maurice had a son, also named Maurice, who was a judge at the beginning of the Revolution and espoused the cause of the States. James, another son of Maurice, senior, commanded a regiment in the Continental army, and won a battle at Moore's Cerek bridge. He afterwards became a brigadier-general, and was made commander-inchief of the Southern Department. At the close of the war he received the thanks of Congress. Alfred Moore, a son of the second Maurice, raised a battalion of troops, and severely harassed Cornwallis. He was appointed attorney-general of South Carolina, and subsequently the President made him an associate justice of the supreme court of the United States.

THE O'FALLONS, OF MISSOURI.

Dr. James O'Fallon arrived in America in 1774, and located in Wilmington, N.C. At the breaking out of the Revolution, he enlisted in the American army, and rendered gallant service. At the close of the war he removed to the West. His son, John O'Fallon, became a prominent citizen of Missouri, and, attaining great wealth, was well known for his philanthropic spirit. He served under Harrison, and was wounded at the battle of Tippecanoe. In St. Louis he endowed several educational institutions, and was highly esteemed for his patriotism and liberality.

THE SPHINX.

Seven gates the city hath,
  Looming dim and sheer—
Look! She crouches o'er the path,
  Monstrous shape of fear;
Lion-clawed with heart of stone,
  And, to bait the snare,
Lover's eyes have never known
  Maiden's face so fair.

Hearken to the words she speaks:
  "Read my riddle well;
So the best that mental seeks
  Shall thy fate compel.
Read it not, and thou shalt die—
  Life is little worth,
Save the glory of the sky,
  Pierce the mists of earth."

So spake the Sphinx of old, and so men died,
  Even, Dear, as I who, gazing in thine eyes,
  Behold the riddle of the ages rise,
And read it not, nor stand forth glorified:
  The riddle of thy soul—ah! show me grace:
  Must heart more cold be mine, as thine the fairer face?

French statisticians have discovered that during last winter 800,000 tons of snails were consumed in Paris. This indicates a renaissance for the snail, for although it has always been especially esteemed by the French people it has often fallen into disfavour for a season or two past, owing to the fact that the culture of the snail has been taken up largely by speculators, who have aimed at quantity rather than quality in their productions. Many of the snails sold in Paris really come from Burgundy and the Savoy districts, but are represented as from the vineyards of Dijon and Macon. One of the methods of the speculating snail-growers is to raise them in pens of tarred boards that prevent the mollusks from travelling far.

Ancient Boroughs of Ireland

(From Lewis's "Topographical Dictionary of Ireland, 1837.)

ARMAGH, a city, market, and post-town, and a parish, partly in the barony of O'Neilland West, but chiefly in that of Armagh, county of Armagh (of which it is the capital), and province of Ulster, 31 miles (S.W. by W.) from Belfast, and 65¾ (N.N.W.) from Dublin; containing 10,518 inhabitants, of which number, 9,470 are within the limits of the borough.

The past importance of this ancient city is noticed by several historians, who describe it as the chief city in Ireland. St. Fiech, who flourished in the sixth century, calls it the seat of the empire; Giraldus Cambrensis, the metropolis; and, even so lately as 1580, Cluverius styles it the head of the kingdom, adding that Dublin was then next in rank to it. The orignal name was "Druim-sailech," "the hill of sallows," which was afterwards changed to "Ard-sailech," "the height of sallows," and, still later, to "Ard-macha, either from "Eamhuin-macha," the regal residence of the kings of Ulster, which stood in its vicinity, or, as is more probable, from its characteristic situation, "Ard-macha," signifying "the high place or field."

Armagh is the head of the primacy of all Ireland, and is indebted for its origin, and ecclesiastical pre-eminence, to St. Patrick, by whom it was built, in 445. He also founded, near his own mansion, the monastery of St. Peter and St. Paul, for Canons Regular of the order of St. Augustine, which was rebuilt by Imar O'Hoedegan, and was the most distinguished of the religious establishments which existed here, having materially contributed to the early importance of the place. This institution received numerous grants of endowment from the native kings, the last of whom, Roderick O'Connor, made a grant to its professors, in 1169; insomuch that its landed possessions became very extensive, as appears from an inquisition taken on its suppression. Attached to it was a school or college, which long continued one of the most celebrated seminaries in Europe, and from which many learned men, not only of the Irish nation, but from all parts of Christendom, were despatched to diffuse knowledge throughout Europe. It is said that 7,000 students were congregated in it, in the pursuit of learning, at one period; and the annals of Ulster relate that, at a Synod held by Gelasius at Claonadh, in 1162, it was decreed that no person should lecture publicly on theology, except such as had studied at Armagh. The city was destroyed by accidental conflagration in the year 670, 687, and 770, and also sustained considerable injury in the last-mentioned year by lightning. In subsequent periods it suffered severely and repeatedly from the Danes, a band of whom having landed at Newry, in 830, penetrated into the interior, and having stormed Armagh established their headquarters in it for one month, and on being driven out, plundered and reduced it to ashes. In 836, Tergesius or Thorgis, a Danish chieftain, equally celebrated for his courage and ferocity, after having laid waste Connaught and a great part of Meath and Leinster, turned his arms against Ulster, which he devastated as far as Lough Neagh, and then advancing against Armagh, took it with little difficulty. His first act, after securing possession of the place, was the expulsion of the Bishop Farannan, with all the students of the college, and the whole body of the religious, of whom the bishop and clergy sought refuge in Cashel. The numerous atrocities perpetrated by the invaders at length excited a combined effort against them. Nial the Third collected a large army, and after having defeated the Danes in a pitched battle in Tyrconnel, advanced upon Armagh, where, after a second successful engagement, and while preparing to force his victorious way into the city, the main position of the enemy in these parts, he was drowned in the river Callan, in an attempt to save the life of one of his followers. Malachy, his successor, obtained possession of the city, in which a public assembly of the princes and chieftains of Ireland was held, in 849, to devise the means of driving their ferocious enemies out of the island. In their first efforts the Danes suffered several defeats; but, having concentrated their forces, and being supported by a reinforcement of their countrymen, they again marched against Armagh, and took and plundered it about the year 852.

The subsequent annals of Armagh, to the commencement of the 11th century, are little more than a reiteration of invasions and conquests by the Danes, and of successful but brief insurrections of the natives, in all of which this devoted city became in turn the prize of each contending army, and suffered all the horrors of savage warfare. In 1004, the celebrated Brian Boru entered Armagh, where he presented at the great altar of the church a collar of gold weighing 20 ounces; and after his death at the battle of Clontarf, in 1014, his remains were deposited here, according to his dying request, with those of his son Murchard, who fell in the same battle. From this period to the English invasion, the history of Armagh exhibits a series of calamitous incidents either by hostile inroads or accidental fires. Its annals, however, evince no further relation to the events of that momentous period than the fact of a synod of the Irish clergy having been held in it by Gelasius, in 1170, in which that assembly came to the conclusion that the foreign invasion and internal distractions of the country were the visitation of divine retribution, as a punishment for the inhuman practice of purchasing Englishmen from pirates and selling them as slaves; and it was therefore decreed that every English captive should be liberated. The city suffered severely from the calamities consequent on the invasion of Edward Bruce, in 1315, during which the entire see was lamentably wasted, and the archbishop was reduced to a state of extreme destitution, by the reiterated incursions of the Scottish army.

During the local wars in Ulster, at the close of the 15th and the beginning of the 16th centuries, this city was reduced to a state of great wretchedness; and in the insurrection of Shane O'Nial or O'Neal, Lord Sussex, then lord-lieutenant, marched into Ulster to oppose him; and having attacked him successfully at Dundalk, forced him to retire upon Armagh, which the lord-lieutenant entered in October, 1557, and wasted with fire and sword, sparing only the cathedral. In 1566, O'Nial, to revenge himself upon Archbishop Loftus, who had transmitted information of his hostile intentions to Government, even before the Irish chieftains and the lord deputy had preferred their complaint against him, resolved on a special expedition against this city, and on this occasion committed dreadful havoc, not even sparing the cathedral. In the year 1575, Sydney, the lord-deputy, marched into Ulster against Turlough O'Nial, and fixed his headquarters at Armagh, whither that chieftain, after some ineffectual negotiations through the agency of his wife, proceeded, and having surrendered himself, was permitted to return home without molestation. In the short but sanguinary war carried on between the English Government and Hugh O'Nial, Earl of Tyrone, towards the close of the reign of Elizabeth, the earl obtained possession of this place by stratagem; but unfavourable events in other parts soon obliged him to evacuate the place. In the course of the same war Armagh was again invested, in 1598, by this chieftain, who hoped to reduce it a second time by famine, but was baffled by the treachery of his illegitimate son, Con O'Nial, who, having deserted to the English, discovered a private road by which Sir Henry Bagnall, the British commander, was enabled to send in such a supply of men and provisions as completely frustrated the earl's efforts. Soon after, the English were utterly defeated, and their commander killed, in a desperate attempt to force O'Nial's intrenchments, the immediate consequence of which was their evacuation of Armagh, which, however, was re-taken in 1601, by Lord Mountjoy, who made it one of his principal positions in his Ulster expedition, and occupied it with a garrison of 900 men. In the early part of the 17th century, a colony of Scottish Presbyterians settled here, from which it is supposed Scotch-street, near the eastern entrance of the town, took its name.

At the commencement of the war in 1641, Armagh fell into the hands of Sir Phelim O'Nial, who, on being soon after forced to evacuate it, set fire to the cathedral, and put to death many of the in-

habitants. On the breaking out of the war between James II. and William, Prince of Orange, the earl of Tyrconnel, then lord-lieutenant under the foreign sovereign, took the charter from the corporation, and placed a strong body of troops in the town; but they were surprised and disarmed by the people of the surrounding country, who had risen in favour of the new dynasty: the garrison was permitted to retreat without further injury to Louth, and Lord Blayney, having taken possession of the town, immediately proclaimed King William. This nobleman, however, was soon afterwards compelled to evacuate it, and retreat with his forces to Londonderry, at that period the last refuge of the Protestants. James, in his progress through the north to and from the siege of Derry, rested for a few days at Armagh, which he describes as having been pillaged by the enemy, and very inconvenient both for himself and his suite. In 1690 Duke Schomberg took possession of it, and formed a depot of provisions here. No important event occurred after the Revolution until the year 1769, when the city furnished a well-appointed troop of cavalry to oppose Thurot at Carrickfergus. In 1778, on the apprehension of an invasion from France and of civil disturbances, several of the inhabitants again formed themselves into a volunteer company, and offered the command to the Earl of Charlemont, by whom, after some deliberation, it was accepted. In 1781, an artillery company was formed; and in the following year, a troop of volunteer cavalry, of which the Earl of Charlemont was also captain. In 1796, this nobleman, in pursuance of the wishes of Government, formed an infantry company and a cavalry troop of yeomanry in the town, whose numbers were afterwards augmented to 200: they were serviceable in performing garrison duty during the temporary absence of the regular troops in the disturbanecs of 1798, but in 1812 were disbanded by order of the lord-lieutenant.

The inhabitants were incorporated under the title of the "Sovereign, Free Burgesses, and Commonalty of the Borough of Ardmagh," in 1613, by charter of Jas. I., which was taken from them by Jas. II., who granted one conferring more extensive privileges; but Wm. III. restored the original charter, under which the corporation consists of a sovereign, twelve free burgesses, and an unlimited number of freemen, of whom there are at present only two; a town clerk and registrar, and two sergeants-at-mace are also appointed. The sovereign is, by the charter, eligible by the free burgesses from among themselves, annually on the festival of the Nativity of St. John the Baptist (June 24th); the power of filling a vacancy in the number of free burgesses is vested in the sovereign and remaining free burgesses; the freemen are admitted by the sovereign and free burgesses; and the appointment of the inferior officers is vested in the corporation at large. By charter of King James, the borough was empowered to send two representatives to the Irish parliament, but the right of election was confined to the sovereign and twelve burgesses, who continued to return two members till the union, when the number was reduced to one.

Next Week.—ATHENRY.

OUR WEEKLY STORY

"STUCK!"

Sage, the dapper little City editor of the "Globe," had a great nose for news. He also had a temper. His fits of rage were usually the result of some offence to his journalistic nostrils. They were offended now. His face was as scarlet as the habitual red carnation in his button-hole.

"Bates!", he called, in a tone that boded no good.

A reporter dropped the paper he was reading, thrust a black pipe into the pocket of his shabby coat, and answered the summons.

The editor looked the reporter over from head to toe, and from toe to head, carefully estimating him.

Bates was tall, lean, cadaverous; as angular of feature as he was of form. A great shock of unkempt black hair hung low over his forehead, and gave him a look that was grim, wild, fantastic. The vagaries of nature, as though still unsatisfied, set in his homely head a pair of appealing blue eyes, that diffused a strange peace over his haggard face.

The City editor could not look into those eyes, and be harsh. He knew that by experience. Even now the furtive glance he caught as he looked up at the reporter, softened his rage, and tempered his tone.

"Look here, Bates," he began, more irritated than angry, waving a handful of clippings from rival newspapers; "we've been beaten by every sheet in town, and you're to blame!"

The reporter knew it. He had nothing to say. There is no excuse in journalism.

Sage went on. "This is the third time you've fallen down on an important story within ten days. Two weeks ago you were scooped; and a month before you were beaten by even that insignificant rag the "Gazette." I've warned you repeatedly. You know I won't keep a man on the staff upon whom I cannot depend. I intended to discharge you a week ago; but I thought better of it, and decided to give you another chance. You haven't made good! I can't account for it—you have done excellent work heretofore—you stopped drinking a year ago—what is it?"

"Luck! Rotten luck!"

"Well, the 'Globe' can't afford to employ an unlucky man. As a matter of discipline, if nothing else, I shall have to let you go. I'm sorry! Personally, I like you. You can work on here until the end of the week, and then—take my advice—get out of the newspaper business—you're not fitted for it."

As if to emphasise that point the editor assigned Bates, a man of experience, to report a lecture (about which the paper might print a half dozen lines), and dismissed him.

Bates walked out of the office, dazed, benumbed.

"Get out of the newspaper business; you're not fitted for it." The words whirled through the reporter's mind until his head throbbed.

"My God! if I can't do newspaper work, what can I do? Nothing—nothing! If there ever were other possibilities in me, this business has killed them. I'll simply have to stick to it. But who'll employ me? Every man in town will know why I've been fired."

He was not worried on his own account. His mind was full of a little woman who lay ill in a maternity hospital; the mother of a tiny pink thing—the nurse told Bates it was a boy; the wife whom he feared death would snatch from his arms. And it was this fear, this dread, that usurped all his other thoughts for the past six weeks. It was this ever-haunting horror—a horror that drove the man to the hospital a dozen times a day, when he should have been on the trail of news—which had caused Harry Bates, who had long ranked as a capable reporter, to be classed among the incompetents.

It was a bitter—a hard thing. It hurt his pride—it depleted his purse. Being a space writer, he had been doing badly, for, since he was judged incompetent, he had been given little to do; and for the remaining days of the week he knew he would fare worse.

Fate seemed to have laid a heavy hand on him.

Like most journalists, he had not saved money. He could not afford to be idle a day, so he was obliged to work on through those weeks of worry. He might have had assistance, had he made known the cause of his incompetency; but his sensitive nature, the keener because it was hidden, shrank from the coarse jests some of his fellows would have made at that little woman's expense.

So, thinking of her, he hastened to the hospital, trusting to luck that the lecture would amount to nothing. It did prove of small interest, and, as Bates had prophesied, so did his every assignment for the next five days.

He was despondent, very despondent; not so much that his stories yielded him little, but that his wife was still in the hospital.

"If she were only well and strong again, I could bring in news, and turn out copy they'd be glad to print," he muttered to himself, as he stood by the office window one night, late in the week, and gazed out through the drizzling rain, over the roof-tops.

He sighed and turned from the window. The office clock struck ten. He noted that he was the only reporter in the room. "Yes," he thought, bitterly, "they're all working but me."

Just then the telephone bell rang. A copy reader answered it. He made a few notes on a bit of paper, hung up the receiver, and handed the slip to the City Editor.

Sage raised his eyebrows. "Out of town story; I'll have to see the Night Editor about it." He glanced around the room. The eyes of Bates were on him. "He's the only reporter in the shop," thought Sage; "I suppose we'll have to trust him."

The City Editor rose from his chair, and stepped into an adjoining office, where a dozen men in shirt sleeves were editing copy as fast as it came by wire, telephone, and messenger. The Night Editor, his feet cocked up on the desk, a long Havana between his teeth, was looking over the evening papers. He glanced up as the City Editor accosted him. They exchanged a few words, evidently satisfactory to Sage, for he nodded his head, and re-entered the city room.

"Bates," he said, as soon as he had put his foot inside the door, "here is a chance to redeem yourself." He handed the reporter the slip, and added: "There's a big explosion at Bed Rock, and a lot of people hurt—probably killed. Take the first train out. Hump yourself! Telephone us something—anything—for the first edition; and a good story for the second. Above all keep your wits about you and see you don't get left. Remember, too, that we go to press at one o'clock, and must hear from you, at latest, by half-past twelve."

Though Bates hurried he missed the last train to Bed Rock, a small town about fifteen miles from the city; so that he was obliged to use the trolley line.

It was close to midnight when he reached Bed Rock. As he jumped from the car he caught sight of a mounted patrolman. He hailed the officer and questioned him concerning the catastrophe. The policeman told him where the explosion had occurred; made a wild guess as to the number killed and injured, and a wilder estimate of the losses.

"It's meagre, but it will have to do for the first edition," grumbled the reporter, as he looked at his watch in the dim light of a flickering street lamp, and noted that the hands pointed to ten minutes past twelve. "Now for a 'phone."

He ran along what seemed to be the main street of the town, until, over a barber shop,

*"Stuck" is the expressive journalistic phrase employed when one newspaper appears without an important item of news published by another.

he saw a telephone sign. The place was dark. Bates hammered at the door. A woman put her head out of a window above him.

"I'd like to use your 'phone," began the reporter cheerfully.

"You'll have to wait; my husband's down to the explosion, and I'm not goin' to let any stranger in." The woman closed the window.

Bates glared at the door for a moment as though he had half a mind to break it in, then turned on his heel and inquired of a man in a milk waggon, where he might find a telephone.

"There's a 'phone in the drug store, about a quarter of a mile the other side of the car shed," was the answer.

It was twenty minutes past midnight when Bates found the drug shop. The lights were extinguished, but the druggist was standing at the door.

"May I use your 'phone?" asked Bates.

"No!" replied the man curtly. "I've shut up for the night.

"But I'm a reporter—I've got to send in a story of the explosion—I won't keep you a moment."

"I don't care who you are, or what you have to do. I run this place to suit myself, not you or your paper. If you want a 'phone—go to the Exchange."

"Go to h— !" returned Bates, wrathfully, as he wheeled about and strode up the street.

He was desperate.

It was twenty-five minutes past twelve.

The street was deserted.

He looked up and down the rows of black windows in despair.

"Hello, hello! Yes, this is central." The words floated out through a window above him.

The reporter gazed up eagerly. There was a light in the fourth floor of an office building. Then he made out the sign of a telephone exchange on the door. He caught hold of the door-knob and gave it a vigorous rattle.

A young man thrust his head out of a lighted window. "Well, what's the row, there?" he asked, good-naturedly.

"Say, will you please come down here a minute; I want to speak to you?" The direct request had failed on previous occasions, so Bates was making a departure, with the belief that he could be more persuasive at close range.

"Oh, go on!" exclaimed the youth above; "you're drunk!"

"Drunk! cried Bates, exasperated; "I was never more sober in my life." Then he changed his tone, and put the plea of his eyes in his voice: "Come down and give me a word, and I'll give you a dollar."

The window closed.

It seemed an hour to Bates before the door opened. Then the reporter made up for lost time. He talked like chain lightning. "I want to use your 'phone—got a story of the explosion—must get it into the "Globe" within five minutes—if I don't, I'll lose my job".

"I can't lose mine, to save yours," replied the other. "Its against the rules of the company for me to let even employes into the Exchange, unless they're on business."

"Now, look here, Mr. Central; no one need know I've been here—I'll keep it shady."

It rather tickled the young operator to be called "Mr. Central"; still he demurred.

"My God, man, it's life or death to me—you don't understand!" cried Bates desperately.

The youth did not understand, but he could not resist the appeal of those melancholy blue eyes. "Come in," said he softly; "but mind don't ever give me away."

They hurried up the stairs together, into a large room, furnished only with a rude table, a couple of chairs, and the telephone exchange cabinet. Four or five of the tiny brass hinge-like plates on the cabinet were hanging down, indicating that there were calls for connections.

For the moment the operator paid no heed to the clicking at the cabinet. He busied himself closing the window shutters.

Bates looked at the clock on the white-washed wall. It showed twenty-five minutes of one.

"Be good enough to get me the "Globe" office just as quickly as you can. It is 1-47-62. I must catch the first edition," said the reporter anxiously.

The operator took a seat at the cabinet and clapped a telephone receiver to his ear. "Hello," said he, to someone on the wire; "what number? 1-54-39?"

Bates grasped the youth's arm. "That's the "Chronicle's" number—cut him off!'

"Wires busy; please call again," spoke the operator, into the telephone, with the monotone of a phonograph.

There came another call before "Mr. Central" could move a plug. "Hello! What? Eh? "Daily Graphic?"

"The 'Graphic'! Tell him the wire's busy," besought Bates.

While the "Graphic's" representative stamped about a livery stable, and damned the country telephone operators, Bates was sending in his meagre account of the explosion, in time to make the "Globe's" first edition.

Nor was the "Graphic's" man the only reporter in Bed Rock, that moment, who was swearing. Men from every one of the city's big dailies were fuming because they could not telephone their papers.

Two of the men, at the last moment, rushed frantically to the railroad station to send the story in by telegraph; but they found the office dark, and no one could tell them where the operator lived.

Meanwhile Bates kept right on talking, sending in imaginary details, holding the wire until it was too late for any other reporter in Bed Rock to catch his first edition.

Then he gave up the wire.

"Here's a reporter talking now," said the operator; "do you want to hear?"

"Do I? Give me the receiver!" Bates reached for it.

"You mustn't talk loud," continued the youth, "or they'll hear you at the other end."

"It's Thompson, of the 'Chronicle,' I know him well," whispered the reporter, taking notes of the story buzzing over the wire.

"There, he's through," said Bates, presently. "He's given me the name of every man killed or injured; but he doesn't know the cause of the explosion, or the extent of the losses. It's up to me to hustle a bit for myself."

"Hush, here's another," lisped Bates' confederate, passing the receiver to the reporter.

Bates smiled. He recognised the voice of Johnson, of the Rocket. For ten minutes he did not speak. He was taking down every item Johnson was telephoning.

"Johnson's a mighty good man," remarked Bates, laying down the receiver, and lighting his pipe. "He hasn't half the names, but he has the losses and insurance down pat."

"Then, after a moment's pause, consumed in getting his pipe well lighted, he resumed: "Mr. Central, you're a brick! This is great! Now we sit—pardon me, shall I roll you a cigarette. Very good." He rolled one for the youth. "Here we sit, while the gang rushes about in the rain—I guess you'd prefer to lick the paper yourself"—he gave the cigarette a final twist, and passed it to the operator, as he went on: "while the gang rushes about in the rain, gathering the news, and I edit it on the wire. Do you know, old man, I haven't enjoyed myself so much since ——" He paused suddenly. The light went out of his eyes, and melancholy cast a shadow over them.

The operator did not heed the change, for one of the tiny brass hinges in front of him dropped.

"Here's another reporter," whispered "Mr. Central." He had to pluck Bates by the sleeve before he could get the reporter's attention.

"Eh! What! Oh! Yes!" Bates grabbed a receiver, and was soon puffing clouds of smoke with every scrawl of his fast-moving pencil. The light came into his eyes again. The humour of the situation, and the fact that he was collecting a good story, revived his spirits.

"Drop another dime in that slot," called the operator into the telephone; "you've talked over five minutes." Then he turned to Bates. "Your friend's working the slot machine telephone at the railroad station."

"I think that's Herman, of the 'Eagle.' He's all right for a Sunday special, but he's not much use on a news story. The 'Eagle' will print the history of the Bed Rock Chemical Works this morning, that's about all. Strange no one seems to know anything about the cause of the explosion."

"You can go ahead, now," called "Mr. Central" to the reporter at the railroad station.

Bates took no more notes. "Gosh, but he's long-winded; he's telling the same thing over again," remarked the "Globe" reporter. "Say, isn't it time to charge him another ten cents?"

"He's only been at it three minutes."

"Charge him anyway; I'm getting sick of hearing him talk; besides, it's time I was sending in my story for the second edition."

"Time's up!" cried the operator. "If you've more to say, drop another dime—well, then, two nickels." "Mr. Central" smiled at Bates. "He's kicking!"

"Then cut him off altogether, and connect me with the 'Globe.'"

Bates spread his notes before him. "If I haven't the best story of the Bed Rock catastrophe," he muttered, "it isn't the fault of the other reporters."

. . . . . .

While one of the men in the "Globe" office took Bates' collaborated story over the telephone, a copy-reader whipped it into shape, and passed it, sheet-by-sheet, to the City Editor.

That dapper little person was marvelling at the amount of work that Bates had accomplished, when the reporter at the telephone wheeled about, and exclaimed: "We're cut off, and I've only got the names of two out of the fifteen killed!"

. . . . . .

Bates had been keeping the wire hot with the story, reading it, in disorder, from his hieroglyphic-like notes, and had just come to the list of killed and injured, when the operator switched him on the arm.

"Listen to this," said he, switching Bates on to another wire; "someone's talking to the town burgess."

This is what the reporter heard:—"Hello, Camp—hello—I wish you'd repeat that. Talk louder. I can't half make out what you're saying." Then another voice answered, "We've arrested one man, Allen Reynolds. He used to be engineer of the works, but Hayworth discharged him a month ago. He confesses that he had a hand in the plot to destroy the place, but won't give the names of his accomplices. I think I can lay my hands on 'em, though, in the mornin', if they don't get wind of Reynolds' arrest."

That was enough for Bates. "Give me the 'Globe' again—in a hurry!" he exclaimed. "Incendiary origin! Diabolical plot! Lord, won't that jar the other sheets! I'll beat the town!"

The operator was almost as interested as the reporter. He cut in on someone calling a physician, and gave Bates the city wire.

"Hello, is that the 'Globe'?" asked the reporter. "This is Bates!"

While the man at the other end was taking the reporter to task for keeping the paper waiting, there came a heavy knock at the street door of the exchange.

"What's that?" questioned Bates, anxiously.

"Mr. Central" threw open the window and looked out. He spoke to a man below, and came back to the cabinet. "There's a lineman at the door. He's got to come up to look over the wires. The explosion has mixed up some of them."

"What are you going to do? I've got to get this stuff in somehow." Bates' look was almost threatening.

"I'd lose my job if the lineman found you here."

"Can't I hide in that closet until he goes; he won't be long, will he?"

"I wouldn't dare risk it," replied the operator hastily. "But I've got an idea. I can get you out without him seeing you."

"But I've got to get the biggest end of this story in yet." The reporter's under lip was quivering.

"You can telephone from the livery stable. It's on the block below, and is open all night. Grab up your papers and follow me." With that the operator quietly led the way down the stairs to the second floor. A door stood open on a landing. "Slip in there," said the youth, "until the lineman gets upstairs, then sneak out."

"All right," returned Bates, as he thrust a bill in the other's hand, and pressed it warmly. "You've done me a great favour—I won't forget you."

The operator winked, and slid down the balusters.

A minute later Bates tiptoed down the creaky flight, holding his breath as he went. He opened the street door carefully, and closed it softly after him, then hurried along the street to the livery stable. A sleepy groom admitted him, remarking that he was the third reporter who had been there that night.

Bates stepped into the telephone box. Up in the exchange "Mr. Central" was holding the wire for him, and the big end of the story, which no other paper had even a hint of. The fact that the explosion was the result of an incendiary plot was soon startling everyone in the "Globe" office, from the copy-boy to the Managing Editor.

It was a great story, and the City Editor was only waiting to see Bates to congratulate him. He would not let the reporter go now.

Sage wondered why, on that day above all others, Bates should be late. He grew impatient as the hours passed and still no sign of the reporter. The City Editor was on the point of sending the copy to Bates' address, when he entered the office.

Sage did not notice that the reporter was unusually pale, and that his look was wilder than ever; he merely glanced up from the proof-sheets before him, and said: "Sit down, Bates; I want to talk to you."

Though the reporter hardly seemed to hear the other's words, he sank into a chair. There was something hopeless in his attitude, something tragic in his look.

The City Editor went on, scrutinising the proofs as he talked: "You've beaten the town to-day, Bates. It was a rattling good story, yours. I want you to stay with us. Now, there ought to be a good follow story in that explosion. It's more than likely the Bed Rock authorities have made other arrests. I'm going to send you out there."

Bates was silent. Sage wheeled around in his chair, and looked at the reporter. He found him studying the pattern in the linoleum.

"Well, well!" The City Editor was a bit impatient.

Bates looked up with a start. He had scarce noted Sage's words.

"I want a little money," said the reporter abruptly.

"Broke, are you? How much do you want?"

"Hundred dollars."

"Hundred dollars! What do you need with a hundred dollars?"

"Bury my wife!" The reporter's tone was unnatural, hard, cold; only his eyes revealed his misery.

Sage stared at him a moment. When he spoke it was not the dapper little City Editor, with the red carnation in his buttonhole, and a nose for news; it was the husband, the father, the man. "It will be all right about the money. I'm sorry, very sorry, old man; I didn't even know she was ill."

"Only six weeks."

The City Editor understood now why Bates had been incompetent. "What was the trouble, Harry?" It meant something for Sage to call a man by his Christian name.

"A boy!" Bates' monotone was uncanny.

Sage laid his hand on the reporter's arm.

They were both silent for a moment; then the City Editor spoke: "The boy—eh—he'll live, I hope?"

Bates nodded his head.

Sage was the City Editor again, with the red carnation, and the nose for news! He turned to Bates, and remarked: "You're the only man who should cover that story—you know the ground thoroughly."

Bates' chin was sunk on his chest. He replied without raising his head: "What's the use? I've nothing to work for now!"

"How about the boy?"

The reporter started as though something had stung him: "That's so!" he muttered.

He picked up a handful of copy paper and walked out of the office.

THE MAN WITH THE PEN.

From the king to the serf is a far call, we think,
Yet the symbol of both is a bottle of ink,
For with prowess unmeasured—with work never done—
The man with the pen is the two rolled in one.
He rules like a monarch, he toils like a slave,
And the rest that he dreams of he finds in the grave.

When the man with the pen takes the orders to think,
And swears his allegiance to paper and ink,
He parts with all pleasures that other men find
In the fair world about him—his realm is the mind.
Oh, a wonderful realm is that region, I know,
Where the thought-flowers bloom and idea-plants grow,
But nowhere in serfdom do labourers toil.
With the pick in the mines, or the hoe in the soil,
Like the slave-monarch, gathering thoughts out of space
To aid, and amuse, and enlighten the race.

The king has distractions, the slave has his rest,
But the serf-monarch's sleep is a dream-haunted quest
For ideas—and all the distraction he knows
Is weaving new garments of words for old woes,
New garbs for old sorrow, new names for old sin,
And setting new goals for spent runners to win.
His days are as night, and his nights are as day,
The stern angel Duty walks with him alway;
Through respite, or slumber, he hears the word "write,"
And the end of achievement is never in sight.
Tho' he mounts the top round in the ladder of fame
The cry of earth's hungering hosts is the same;
It strikes to his marrow and rouses again
The toil-weary mind of the man with the pen.

The world moves about us a mighty machine,
And its intricate wheels within wheels are unseen,
An empire is builded, republics are born,
A kingdom is wiped by the finger of scorn
From the slate of the nations—a lesson is taught,
A criminal punished—a culprit is caught,
A statesman and lawmaker rises to power,
A wave of reform strikes the world in an hour
And sweeps all before it; and back out of sight,
As silent and patient, and forceful as light,
Is the impulse to action, the moulder of men,
The guider of purpose—the man with the pen.

The man born an emperor rules while he may,
The millionaire king buys a brief right of way,
But the monarch of thought, tho' his name is unheard,
Knows that nations unborn by his mind shall be stirred,
For thought is a dynamite force, and when hurled
It changes the aspect and face of the world.

The right hand of Progress, sweet Charity's friend,
The eyes for blind Justice, the sword to defend,
Uncrowned yet a monarch, no throne but a den—
God guide him and bless him, the man with the pen!

THE INFLUENCE OF MUSIC

By M. J. B.

II.

The bards may go down to the place of their slumbers,
The lyre of the charmer be hushed in the grave,
But far in the future the power of their numbers
Shall kindle the hearts of our faithful and brave.

—"Irish Penny Journal," i., 284.

Whenever we wish to describe the highest kind of bravery, we speak of Spartan courage. The ancient Spartans were, and still continue to be, the most famous warriors in the pages of history. They were a soldier nation, long regarded as invincible. However, the fates were once against them, and reverse followed reverse until despair began to gnaw their magnanimous hearts; they sent to consult the famous oracle of Delphi, which advised them to chose for general a lame schoolmaster, Tyrtaeus. This seemed, indeed, a cynical mockery, but they bowed to the oracle. Tyrtaeus knew nothing of war, but he set to composing martial songs, which so inspirited his men, that victory once again marched with the armies of regenerated Sparta. The inimitable Plutarch tells us of the Spartans that "their songs had a spirit, which could rouse the soul, and impel it in an enthusiastic manner. . . Indeed, if we consider with some attention such of the Lacedæmonian poems as are still extant ,and get into these airs which were played upon the flute, when they marched to battle, we must agree that Terpander and Pindar have very justly joined valour and music together. . . When the army was drawn up and the enemy near, the king sacrificed a goat, and commanded them all to set garlands upon their heads, and the musicians to play Castor's march, while himself began the pæan ,which was the signal to advance. It was at once a solemn and a dreadful sight, to see them measuring their steps to the sound of the music, and without the least disorder . . moving forward cheerfully and composedly with harmony to battle" (Life of Lycurgus).

The historian, Thucydides, in one of his graphic descriptions of the battles of his own time, relates how on one occasion the Spartans were pitted against the Mantinæans, Argives, and Athenians, and he describes both armies drawn up and their generals haranguing the allies, and appealing to their reasons, showing what fortunes depended on victory or defeat; but the Spartans had no such speeches. Breaking into warlike songs, they swept down on the allied hosts, and drove them from the field (Thuc. v., 69). Hence Milton represents Satan as marshalling his troops to Spartan music:—

Anon they move
In perfect phalanx to the Dorian mood
Of flutes and soft recorders; such as raised
To height of noblest temper heroes old
Arming to battle.

—Paradise Lost, i.

Amongst the Greeks there was a famous war song called the Orthian hymn, and we are told that on hearing this song Alexander the Great was so fired with enthusiasm that he sprang from his seat and called for his arms in the wild frenzy of the moment (Heredotus—Beloe's Translation, Lon., 1821., i., 54, note).

So Pope sings:—

But when our country's cause provokes to arms,
How martial music every bosom warms!
So when the first bold vessel dared the seas,
High on the stern the Thracian raised his strain,
And men grew heroes at the sound.

—Ode on St. Cecilia's Day.

And that versatile litterateur, Father Francis Mahony, was never nearer to sober truth than

when he exclaimed: "From Tyrtaeus to Beranger ,the muse has befriended through every age the cause of liberty. The pulse of patriotism never beats with bolder throb than when the sound of martial song swells in the full chorus of manly voices; and it was in a great measure the rude energy of the 'Marsellaise' that won for the ragged and shoeless grenadiers of the convention the victories of Valmy and Jemmappe. In our own country, Dibdin's naval odes . . . have not a little contributed to our maintaining in perilous times the disputed empire of the ocean against Napoleon"—"Reliques of Father Prout" (Bohn's Lib.,) 352.

Assuredly we, Irishmen cannot hear without some emotion the strains of "O'Donnell Aboo," and can imagine its effect when the front of battle lowered.

The pipers figured most conspicuously in the wars of Elizabeth's reign. Mr. Standish O'Grady, who has made the history of this period a particular study, and who, as one of the editors of State Papers appointed by the Government, had especial opportunities of investigation, thus speaks of these heroes:—"They were brave men, these pipers. . . . The piper went before his men and piped them into the thick of battle—the fall of the musician was an event of importance second only to that of a considerable officer. So in the State Papers, pipers are specially mentioned amongst the slain in such a manner as to indicate that the slayer was particularly proud of such achievements."—"Bog of Stars," etc. (New Ir. Lib.), 155.

Indeed, the pipers have a long history of their own, for the Spartan laws required a certain number of pipers in every regiment; and from these days, to that of Piper Findlater, their record has been one of valour (Thucydides, v., 70).

But not only does martial music inspire valour, it also strikes terror into opponents; and so Sir Francis Drake, the famous Admiral, in the reign of Elizabeth, took with him trumpeters and other musicians for this purpose (Bloomfield's "Thucydides, Lon., 1829., iii., 204).

THE GEOLOGY OF KILLINEY.

The granite veins of Killiney are extremely curious, and worthy the study of geologists. When we descend to the shore a little to the east of the Obelisk, we find ourselves bounded by perpendicular rocks. These are of two kinds—granite and a schistoze or slaty rock, of a bluish colour, termed mica schist. We observe that it rests on its edges on pavement of granite, and reclines against that rock. The junction of the two rocks is quite perceptible, but their is no blending of their characters. We may next observe a ledge of rock partly covered by the sea, and extending in a north and south course along the shore. This is a granite vein of several feet in breadth, several hundred yards in length, and bounded on both sides by mica chist. The great vein running parallel to the strata gives off a smaller vein at right angles to the direction of the strata, and which contains fragments of mica schist. We may conclude from this, that originally fissures were produced in the schist, and filled up by molten granite, which entangled fragments of the mica, which fell from the sides of the fissure. Heat, of course, is the only agent capable of melting granite. We detect other granite veins, each affording some curious and minute fact in harmony with the proceeding remarks. As it is easier to split a piece of wood in the direction of the grain, than transversely, we infer it is easier for liquid granite to insinuate itself between the strata than to find its way across them. The large vein is broader than all the transverse veins put together. At the point near the entrance of the abandoned lead mine, the vein does not hold a straight course, nor is it of equal thickness, but is serpentine and unequal, as if the strata had been violently lacerated instead of being split. The vein itself has been broken and its fractured extremities a little displaced and detached, thus proving that the strata had been exposed to concussion and displacement at that period posterour to that when the vein was found.

THE

STORY OF RATHMICHAEL.

PAPER BY MR. ELRINGTON BALL.

On Tuesday, February 25th, Mr. F. Elrington Ball read a paper before the Royal Society of Antiquaries of Ireland on "Rathmichael and its Neighbourhood." He said that in addition to the exquisite combination of sea and mountain scenery, which the district affords, it was possessed of a history which presented an interesting picture of life on the borders of the English Pale in mediæval times. Although afterwards one of the battlefields on which a bloody conflict was waged between the Irish tribes and the forces of the English Crown, it was for more than a century singularly free from disturbance and concord existed between the Irish inhabitants and the new settlers. The invaders found the district thickly studded with religious establishments, chief amongst these being Rathmichael, where a typical group of Celtic ecclesiastical buildings, including a round tower, was to be seen. Near Rathmichael, where now stands Shankhill Castle, lay the little town of Shankill, which contained, besides other houses and a church, a manor house of the Archbishop of Dublin, to whom the lands belonged. There the Archbishops, in the thirteenth century, constantly stayed. The manor of Shankill was of considerable size, and included the town of Dalkey and Powerscourt, where a weekly market was held. Part of the lands were in the hands of the Archbishop, and part in the hands of his betaghs and other tenants. At Shankill the Archbishop's senechal held a court, in which the inhabitants of the manor were tried for murder as well as for less important crimes. In some cases, however, the offenders fled to the churches within the manor, and claimed the protection of the church, which was freely granted. Outside the manor lay the lands of Ballycorus, which belonged to various owners, and the lands of Tully, which belonged to the Priory of the Holy Trinity. On the lands of Shanganagh stood the Church of Kiltuck, remains of which are still to be seen. Bray was in mediæval times the site of a great castle and a corporate town. It belonged to the Rideleford family, and occupied, as it does at present, both banks of the river. Two of the Dublin monasteries had houses in the town for the purpose of traffic with the Irish inhabitants of the mountains, one of the chief commodities thus obtained being firewood. Near Bray lay the Church of Old Connaght, and further on, in a lovely wooded glen, the Church of Ballyman. The peaceful and prosperous condition of the district for the greater part of the thirteenth century was shown by the fact that the valuation of the prebend of Rathmichael more than doubled in the first fifty years; but towards the close of the century the reign of fire and sword began, and the lands were devastated and laid waste. The Scotch invasion under the Bruces gave the Irish tribes fresh courage; and Sir Hugh Lawless, who had the custody of Bray, only received as his profit from it for five years, two salmon. The manor of Shankill was continually ravaged and pillaged, and all the buildings were burnt. Some years later the barrier which enclosed the English Pale began to be constructed, and the castle at Bray was repaired, and a garrison maintained in it. The lands began to be again let, but at much lower rents and in larger quantities. The first to hold them under a state of things, that required skill in the use of arms, as well as knowledge of agriculture, were the Lawless family, and they were succeeded by the Walshes. By the former family the Castle of Shanganagh, ruins of which are to be seen near the river of Loughlinstown, was built, while the castle at Shankill was erected at the same time by the Barnewell family, and the castle, now known as Puck's Castle, by the Talbot family. The only church mentioned in the sixteenth century was that of Rathmichael, where the Walshes and Barnewells were buried. Before the rebellion of 1641 the district had regained considerable prosperity; the residences are described as fair houses, and were surrounded by orchards and gardens. The principal inhabitants were Catholics, and such Protestants as there were belonged to the poorer classes. After the rebellion Bray became one of the stations for the Confederate Army, and the district suffered severely from the uncertainty of the time, Then came the Commonwealth, and the old inhabitants had to seek other houses, the effect of the change being well exemplified in the case of the Barnewells of Shankill, who had a household of thirteen persons, besides many employes in the village, which contained 26 householders. After the Restoration the lands of Shanganagh and Old Connaght were restored to the Walshes, and those of Shankill to the Barnewells. The latter soon assigned their interest in Shankill to the Lawless family, who again appeared in the district, but the Walshes held the lands of Old Connaght and Shanganagh until the middle of the eighteenth century, when they sold them to the Roberts family, now represented by Captain Lewis Riall.

(Next week.—The Battle of Rathmines.)

HABITS OF THE SEAL.

The seal is endowed with a remarkably powerful brain development, and is gifted with an amount of sagacity which entitles him to take high rank even among domestic animals. He is easily tamed, and evinces a degree of attachment in domestication second only to man's most faithful friend, the dog. This is noticed by Pliny, and Cuvier describes one displaying much intelligence and performing many tricks. But probably the most convincing, as it certainly is the most affecting, story of the domestic nature and attachment of the Phoca vitulina, or common seal, is the following story, which is well authenticated:—"A young seal was domesticated in the house of a farmer near the sea-shore in Ireland. It grew apace; its habits were innocent and gentle; it played with the children, was familiar with the servants, and attached to the house and family. In summer its delight was to bask in the sun; in winter, to lie before the fire; or, if permitted, to creep into a large oven—the common appendage to an Irish kitchen. A disease attacked the black cattle, many of which died. An old hag persuaded the credulous owner that the mortality among his cattle was owing to retaining about his house an unclean beast—the harmless and amusing seal—and that it should be got rid of. The superstitious man caused the poor creature to be carried in a boat beyond Clare Island, and thrown into the sea. The next morning the seal was found quietly sleeping in the oven. He had crept through an open window and taken possession of his favourite retreat. The cattle continued to die; the seal was again committed to the deep at a greater distance. On the second evening, as the servant was raking the fire, she heard a scratching at the door; she opened it, and in came the seal. It uttered a peculiar cry, expressive of delight, at finding itself once more at home; and, stretching itself upon the hearth, fell into a sound sleep. The old hag was again consulted. She said it would be unlucky to kill the animal, but advised that its eyes should be put out, and then thrown into the sea. The deluded wretch listened to the barbarous suggestion, and the innocent creature was deprived of its sight; and a third time, writhing in agony, was carried beyond Clare Island, and thrown into the sea. On the eighth night after the harmless seal had been devoted to the Atlantic, it blew a tremendous gale. In the pauses of the storm a wailing noise was at times faintly heard at the door, which the servant concluded to be the banshee (the harbinger of death in a family). The next morning, when the door was opened, the seal was found lying dead upon the threshold."—"Weld's Vacation in Ireland."

THE THOLSEL OR OLD CITY HALL.

THE THOLSEL.

Harris, in the appendix to his history, thus describes the building shown above:—

"This pile was reared in the year 1683 at the charge of the city. It has its name from the old word toll-stall, i.e., a stall or seat, where the toll-gatherers attended to receive the toll or custom for such goods, as were liable to a city impost. Here delinquents are tried before the lord mayor, even for capital offences (murder and treason excepted), and matters of property for any sum beneath 40s. By a late act, commonly called the Civil Bill Act, all debts where the sum litigated does not exceed the sum of £20, are determinable in this place, in a summary way, and at a trifling expense. Here the lord mayor, aldermen, commons, and sheriffs meet to transact city business. 'Tis beside the stadt-house or exchange for merchants, who have also a spacious hall in the upper part of this building. 'Tis a large quadrangular pile of hewn stone, supported by arches and pillars, whose front has a magnificent appearance, elegantly enriched, and adorned with the statues of Charles II, in whose reign it was built, and of his brother James Duke of Yorke, afterwards James II.

THE HISTORY AND ANTIQUITIES OF THE CITY OF DUBLIN.

FROM THE EARLIEST ACCOUNTS:

Compiled from Authentick Memoirs, Offices of Record, Manufcript Collections, and other Unexceptionable Vouchers,

By THE LATE WALTER HARRIS, ESQ. WITH AN APPENDIX.

Chapter II.

A Short Description of the Castle of Dublin

Sect. I.

The castle of Dublin is to be considered in a threefold respect. (1) As a fortress or citadel erected for the defence of the city, and the security of the English interest in Ireland. This end it is well known to have answered in the rebellion of 1641; and before that event it was signally useful in that of Thomas Fitzgerald, in 1534. (2) As the royal seat of government, to which it has been converted in latter ages, though not erected for nor applied to that purpose originally. (3) As the place where the courts of judicature were anciently held, and sometimes the high courts of parliament.

I. It is a generally-received opinion that Henry Loundres, Archbishop of Dublin, built this fortress about the year 1220 (a) But it will appear from the following patent that it was erected, or at least begun, in the government of Meiler Fitz-Henry, about the year 1205. "Rex dilecto, &c.——The King to his beloved and faithful subject, Meiler Fitz-Henry, lord justice of Ireland, greeting. You have given us to understand, that you have not a convenient place, wherein our treasure may be safely deposited; and for as-much, a fortress would be necessary for us at Dublin, we command you to erect a castle there, in such competent place, as you shall judge most expedient, as well to curb the (b) city, as to defend it, if occasion shall so require, and that you make it as strong as you can with good and durable walls. But you are first to finish one

(b) Ad justitiandum.

tower, unless afterwards a castle and a palace, and other works, that may require greater leisure, may be more conveniently raised, and that we should command you so to do; for which you have our pleasure, according to your desire. At present, you may take to this use three hundred marks from G. Fitz-Robert, in which he stands indebted to us. We command also our citizens of Dublin, that they strengthen their city, and that you compel them thereunto, if they should prove refractory. It is our pleasure also, that a fair be held at Dublin every year, to continue for eight days, and to begin on the day of the Invention of the Holy Cross, another at Drogheda on St. John Baptist's day, to continue also for eight days, with toll and custom thereunto belonging; another at Waterford on the festival of St. Peter ad Vincula for eight days, and another at Limerick on the festival of St. Martin, for eight days: and we command you that you give public notice hereof by proclamation, that merchants may resort to them. Witness the lord bishop of Norwich at Geddington, 31st August, 1205."

If it be not manifest from the fore-cited patent, yet it is highly probable, that the lord justice Fitz-Henry began the castle, in regard the grant was made at his solicitation, the necessity of the work set forth, a fund allotted for the execution of it, and that he continued upwards of three years afterwards in the government: though, as it was an extensive structure, perhaps archbishop Loundres might have had the honour of putting the last hand to it.

It would be impracticable to give an exact description of this royal building, as in its ancient form, on account of the many alterations it underwent at different times. Yet we will adventure to give the reader such particulars upon the subject as have occurred, and hope for indulgence where the description appears to be defective.

The entrance into the castle, from the city, was on the north side, by a drawbridge, placed between two strong round towers from Castle-street, which took its name from this fortress. The towers were called the Gate-towers, and the most westward of them till lately subsisted, the other having been some time before pulled down, to make a more commodious entrance into the court of the castle. The gate-way between these towers was furnished with a port-cullis, armed with iron, to raise or let down as occasion required, and to serve as a second defence, in case the drawbridge had been surprised by an enemy. Since the intervention of artillery, two pieces of great ordnance were planted on a platform opposite to the gate, to defend it, if the drawbridge and portcullis should happen to be forced.

From the western gate-tower, a strong and high courtin extended in a line parallel to Castle-street, as far as another tower, which in the last century took the name of Cork-tower upon the following occasion. On the 1st of May, 1624, about nine o'clock in the morning, this tower suddenly fell down, and being only in part re-built at the charge of the public, Richard Boyle, the opulent and first earl of Cork, in the year 1629, undertook to finish it at his own expense; and in the accomplishment thereof disbursed £408. His arms and an inscription were fixed in the wall, at the place from whence he carried the work. This tower has been since demolished to make room for other buildings.

From Cork-tower, the wall of the castle was continued in one courtin of equal height with the former, until it joined Birmingham-tower, which was the stateliest, strongest, and highest tower of the whole. It is said to be erected by John Birmingham, earl of Louth, and baron of Atherdee, who was lord justice in the year 1321, or by Sir Walter Birmingham, who was lord justice in 1348. But we conceive that it had an earlier existence than either of these periods, was coeval with the rest of the fortress, and called the high-tower, as it over-topped the rest; otherwise the citadel would be left imperfect, and the southern and eastern courtins without proper defence, for want of such a flanker. It seems, therefore, to have taken its present name from the long imprisonment in it of Sir William Birmingham, and Walter, his son, who were committed to this prison in the year 1331, for evil practices against the government, and the year following the former was taken out from thence and executed; the other was pardoned as to life, because he was in holy orders. Certain it is, that it was known by the name of Birmingham-tower as early as the 13th year of king Henry IV.—i.e., A.D. 1411; and what is contained in the tower itself, exhibits undoubted evidence of this. For in it may be seen a grant of that year to John Conyngham "of a waste parcel of land, then of no value, lying under the castle of Dublin, called the castle-ditch; extending in breadth between the said castle eastward, to a certain parcel of land (formerly called le Shepe's land), which the said John and one Richard Bernard possess towards the east, and in length between the same castle to the south to the high-street, called Castle-street to the north, and from the bridge of the said castle to the city wall, adjoining to a certain tower of the said castle, called Birmingham-tower." This record proves not only what is before asserted, but also shows the growth and increase of the city without the walls since that time. For the two Sheep-streets take their names from a piece of pasture ground, called in the record "le Shepe's land," extending from the city ditch to the Carmelite monastery in Whitefriar's-street, and not called Ship-street, as being formerly a station for shipping, according to vulgar tradition; and in archbishop Alan's registry it is called "vicus ovium," from undoubted records. But this is beyond the bounds of the castle.

This tower was often used as a prison for state criminals, and is at present a repository for preserving the ancient records of the kingdom, for which purpose an establishment was formerly made to the officer of ten, and increased to five* hundred pounds a year.

From Birmingham-tower the wall was continued by another high courtin as far as the wardrobe-tower, which now affords an entrance to the chapel, and was formerly, as it still remains, a repository for the royal robe, the cap of maintenance, and other furniture of state, preserved here by a patent officer, who has a competent salary for that employment. Between Birmingham-tower and the wardrobe-tower the courtin was interrupted by two other nameless towers, of much less dimensions than either of the former, one of which, together with a part of the courtin, has been taken down, as well to make room for other necessary buildings as to give an entrance into the castle gardens contigious to it. The stump of the other of those towers yet remains, and on it is erected an elegant polygonal apartment, which serves for a cabinet to the government.

From the wardrobe-tower another courtin extended to the north, or store-house tower, which stood near Dame's-gate, and is now entirely demolished. This tower formerly served as a repository for the king's ammunition and stores†; and from thence the courtin was continued to the eastern gateway-tower, at the entrance into the castle.

The castle is of an oblong quadrangular form, and was originally encompassed with broad and deep moat, part of which was dry, but that part which lay to the east was filled with water by the flowing of the tide, and a branch of the river Dodder, which runs in a channel under an arch by the edge of the castle garden, and supplies the stables and other outofiices of the palace. This moat has from time to time been filled up, and at present is become private property, by grants from the crown, as may be seen before in the instance of John Conyngham, who was clerk of the king's works, an officer in the nature of a surveyor-general. By a concordatum yet remaining in Birmingham-tower, dated 23rd of October, 9 Hen. VI. (1430), "twenty marks a year were allotted out of the revenue of the kingdom for the reparation of the castle hall, buildings, and towers of the castle of Dublin, wherein the books and records of chancery, of both benches, and the ex-

*The augmentation of appointment was made in favour of the celebrated Mr Addison, who was secretary at that time to the earl of Wharton, Lord Lieutenant of Ireland.

†This seems to be the tower mentioned by Sir H Sydney in his letter to the lords of the council of England, April 14, 1559.—And whear your lordships may thinke strange the demande of fower thousand of leade: it may pleas the tunderstonde, a great part thereof to be ment for and towarde the covering of a certain tower within the castle of Dublin, whose rowfe was taken down by my lord of Sussex, and a platfourme thereon made; and thereupon a cannon planted, to the great force of that the queene's majesties piece, and terror of the evil disposed fort: So, as if the same be not in tyme covered agyn, it wil be the fynal decaye of that tower; beside the losse we have in the meane, of the neither rowmes there, for the bestowing of poweder, and other munycions,, wherof (being as it is) we can lay there nothing. Collins's Letters, vol. I. p. 6.

chequer were kept, and which were then in such a ruinous condition, that the said books and records were greatly damaged by rain and the violence of the weather; and the said twenty marks be paid into the hands of John Conyngham for the year ensuing, to enable him to proceed on the said works."

There were formerly two sally-ports or postern-gates in the walls of this fortress—one near Birmingham-tower towards Sheep-street, and the other afforded a passage down to the back yard and the out-offices. The former was closed up in the year 1663, by order of the duke of Ormond, then lord lieutenant, upon the discovery of the conspiracy of Jephson, Blood, Warren, and others, whose scheme was to surprise the castle by that port. The other remained within our own memory, until the courtin, extending from the wardrobe to the north-tower, together with the latter, were taken down to make room for a new range of buildings, where at present the council-chamber and some of the offices of the secretaries stand.

On the outside of the castle, towards the east, stands a chapel for the service of the household, a lodging for the office of a groom-porter, or gaming- table, lately put down, the provost-marshal's prison, an armoury, the work-houses of the armourers and smiths belonging to the train of artillery, the stables of the chief governor, and a range of fair buildings, some years since erected, and employed in offices belonging to the public, such as the offices of ordnance, war, treasury, for the registering of the deeds and conveyances of the kingdom, and the like.

The ancient officers, to whom the guard of the castle ordinarily belonged, were a constable, gentleman-porter, and a body of warders, consisting of archers and pike-men and (after the invention of guns and gunpowder) of harquebussiers, or mus-keteers, and artillery men; a quantity of great ordnance being placed on platforms in the most convenient places for defence. The two towers at the gateway or entrance were set apart to the use of the constable for the custody of state prisoners, and they were indeed a strong security for such purposes: yet prisoners have found means to escape out of them, either by connivance or bribery. One signal instance of this happened in the case of the lord Delvin, who in 1606 was committed in ward here for joining in a conspiracy with the earls of Tyrone and Tyrconnel, Maguire, O'Cahan, and most of the chiefs of the Irish septs of Ulster, to surprise the castle of Dublin, cut off the lord deputy and council, dissolve the state, and set up a government of their own. The conspiracy was discovered on the 19th of May, 1607, by a roman Catholic entrusted with it, who dropped a letter in the council-chamber, directed to Sir William Usher, clerk of the council, and immediately carried to the lord deputy Chichester, then sitting in council, to the following import, "That he (the writer) was called into company among some popish gentlemen, who, after administering an oath of secrecy, declared their purpose was to murder or poison the deputy, cut off sir Oliver Lambert, to pick up one by one the rest of the officers of state, to oblige the small dispersed garrisons by hunger to submit, or to pen them up as sheep in shambles. That the castle of Dublin being neither manned nor victualled, they held as their own, that the towns were for them, the country with them, the grandees abroad and in the north prepared to answer the first alarm, that the powerful men in the west were assured by their agents to be ready as soon as the state was in disorder, that the catholic king had promised, and the jesuits from the pope warranted men and means to second the first stir, and royalty to protect all their actions; that as soon as the state was dissolved, and the king's sword in their hands, they would elect a governor, chancellor, and council, despatch letters to the king, trusting to his unwillingness to embark in such a war, and his facility to pardon, would grant them their own conditions of peace and government, with toleration of religion; that if the king listened not to their motions, the many days spent in England in debates and preparations, would give them time enough to breathe, fortify and furnish the maritime coasts, and at leisure to call to their aid the Spanish forces from all parts." The discoverer further declares, "That he interposed some doubts to them, which they readily answered, and he pretended to consent to further their objects, and that he took this method to give notice of their designs, though he refused to betray his friends, in the mean time, that he would use his best endeavours to hinder any further practices": and he concludes, "That if they did not desist, though he reverenced the mass, and the catholic religion, equal to the devoutest of them, yet he would make the leaders of that dance know, that he preferred his country's good, before their busy and ambitious humours." On this discovery, Tyrconnel, Tyrone, and Maguire fled beyond seas, most of the conspirators absconded, some were taken and executed, and lord Delvin (as appears by an inquisition taken at the Vicar's-hall near St. Patrick's church on the 9th of June, 1608) was arrested on the 10th of Nov., 1607, and committed to the castle *pro diversis sceleratissimis et nequissimis proditionibus contra dominum regem, coronam et dignitates suas per ipsum Richardum Nugent, baronem de Delvin, perpetratis (says the inquisition), to be kept there in safe custody by Tristram Eccleston, constable of the castle, till he should by due course of law be released: within eight days after which the deputy, having notice that he was meditating an escape, ordered the constable to remove him from the upper chamber next the battlements, into a lower apartment, that he might be kept the more secure, and there be guarded night and day by some of the warders: but Eccleston, in contempt of the deputy, not only suffered the lord Delvin to abide in his upper apartment, without placing any guards over him, but also permitted his lordship's servant, John Evers, to come to him, and bring to his gentleman, Alexander Aylmer, who attended him in his confinement, certain cords, by the help whereof his lordship, on the 22nd of November, descended by the wall of the castle and escaped. The day following a proclamation was issued, signed by the deputy and eighteen of the privy council, for apprehending and bringing him to justice; and Sir Richard Wingfield, marshal of the army, was sent in pursuit of him with a detachment of horse. But his lordship found means to escape, and the next year voluntarily submitted himself to the king, and was pardoned.

*For divers most wicked and atrocious acts of treason committed against our lord the king, his crown and dignities, by him Richard Nugent, lord Delvin.

To return, there was also in ancient times a chaplain allowed for officiating to the garrison in the chapel of this fortress; which office seems to have had commencement in the year 1224, or not long before it. For that year king Henry III. issued a privy seal to William, earl Marshal the younger, then lord justice, "to allow fifty shillings yearly to William de Radclive, the king's chaplain, for ministering in the chapel of the castle of Dublin." Officers of the mint had also their residence here in divers ages, and, upon account of security, it was appointed and set apart as a place for coinage by many acts of parliament, of which numbers yet remain in the Rolls-office. The importance of it also may be seen in the statute of 10 Hen. VII. chap. 14, by which none but a man born within the realm of England was capable of being constable of it, as well as in the care taken from time to time in keeping it in repair. On the 24th of January, 5 Hen. VI. (1427), money being scarce to answer the exigencies of the state, an order passed in council, "that as the hall in the castle of Dublin, and the windows of it were ruinous, and that there was in the treasury an ancient silver seal cancelled, which was then of no use to the king, that it should be broken and sold, and the money arising from it be laid out on the repairs of the said hall and windows." An instance of the frugality of those times. By a statute of 2d Edw. IV. not printed, it was provided, "that 40s. be yearly taken out of the issues and profits of the hanaper, 40s. out of the issues and profits of the chief pleas, 40s out of the issues and profits of the common-pleas, 3l. out of the issues and profits of the exchequer, and 20l. out of the issues and profits of the masters of the mint, and be yearly paid to the clerk of the works of the said castle (for which he was made accountable before the barons of the exchequer), and that all the leads of the isle of the hall of the said castle be sold by the treasurer of Ireland, to make and repair the said hall." But these sums not being paid on account of divers pre-assignments on the fund allotted, an. 15 Edw. IV. (1475) it was enacted, that the sheriffs shall make due payments to the clerk of the works within three months after the sums come to their hands, notwithstanding any assignments on the said issues to any other persons, under the penalty of ten pounds, and that the clerk

of the hanaper pay 40s. allotted on his office within a month after the tally be offered him, and the master of the mint within seven days after the tally be offered him." The former of these acts is among the printed statutes, and the other may be seen in the Rolls-office.

Many attempts have been made to surprise this fortress, of which see hereafter. It was twice besieged in the rebellion of Thomas Fitzgerald in 1534, and a part of it destroyed by fire in 1683. Friar James Keating, prior of Kilmainham, was constable of it in the 18th Edw. IV (1478), and fortified it with men and arms, broke down the draw-bridge, and held it out against the then lord deputy, Henry, lord Grey. But a parliament meeting on Friday after All Saints that year, it was then enacted, "That the said friar should, between that and christmas following, cause the said bridge to be repaired substantially and sufficiently, by the survey of Henry White of Dublin, clerk; and in case of failure, that his office of prior should be void, and that the lord deputy might make a guardian or custodee of the said priory, until the grand master of Rhodes, or prior of St. John of London, should provide a guardian or prior of it.

(To be continued.)

THE MOTHER-TONGUE.

(From the Danish of Grundtvig.)

The mother's name is a heavenly sound
As far as the blue sky bendeth;
The mother's voice casts gladness round
Where the iciest realm extendeth..
Sweet in pleasure and sweet in woe,
Sweet in life and in death also,
And sweet in recollection.

Our mother's voice was the cradle song
That soothed us beyond all other;
And sweetly sounded the mother-tongue
When the first-born lispeth "Mother!"

Our mother-tongue is that in which
Our young souls first found expression;
And the lover knows no other speech
To pour out his full heart's passion.

'Twas spoken by all those kings of old
Round whom our homage gathers,
And by those warriors true and bold
Whom we proudly call our fathers.

Our mother-tongue, in the people's mouth
With words of power it liveth;
'Tis loved in the North and in the South,
And its echo the green wood giveth.

Our mother-tongue, like a flowery wreath,
Both high and low it enfoldeth;
Through it the souls of our fathers breathe,
And the true heart fast it holdeth.

Our hearts speak only our mother-tongue,
They know no rude translation;
'Tis it alone, whether written or sung,
Which from sleep can arouse a nation.

Our mother-tongue, by the sea-shore wild,
And in deep woods, summer laden,
How sweetly it sounds for man or child,
But sweetest for the lips of a maiden.
Sweet in pleasure and sweet in woe,
Sweet in life and in death also,
And sweet in recollection.

France owns 2,864,000 dogs, 73 to every 1,000 inhabitants. The dogs are registered and so can be counted. Germany has 2,200,000 dogs.

NOTES ON IRISH WATER POWER
AND
ITS ELECTRICAL DEVELOPMENT.

By W. TATLOW, M.A., B.E., Associate Member.

II.

Artificial reservoirs for power purposes have been constructed on the upper Bann, which rises in the Mourne Mountains at an elevation of over 2,000 feet, and in its descent to Lough Neagh drives numerous linen and flax mills. The Lough Island reservoir, at an elevation of 430 feet, was constructed in 1839 on the site of a natural lake over which a head of 35 feet of water was raised by an embankment to form a reservoir covering 259 acres and of a capacity of 270,000,000 cubic feet. The Corbett reservoir, further down on the same river, was constructed in 1847, whereby a head of 11 feet 3 inches was raised over an area of 70 acres.

These works, an interesting account of which may be found in a paper by Mr. Smyth in the Transactions of the Institute of Civil Engineers of Ireland, June 13, 1869, cost about £30,000, and a rate of £10 per foot of fall was levied on the owners of linen mills and £5 per foot fall on the owners of corn and scutch mills benefited by the increase flow; 180 feet out of the total fall of 350 feet appear to have been thus rated, showing that fully one-half of the natural fall of the river was utilised in the case of the Upper Bann. These works were considered economical and satisfactory when made, but it must be borne in mind that at the time of their construction a steam horse-power for working mills of this kind was estimated to cost about £30 a year.

In connection with the Rathmines waterworks a reservoir has been constructed at a more recent date to impound the storm water of the upper part of the Dodder from a catchment of about 6,000 acres, the store thus accumulated being subsequently sent down the river in compensation for the water abstracted for the supply of Rathmines. At one time a total fall of 370 feet was occupied by mills on the Dodder, twenty-eight in number, making paper, flour, cloth, etc., the total power being about 900 h.p., but being very precarious owing to the nature of the river, which dries up very rapidly in the absence of rain. Many years before the construction of the Rathmines waterworks it was under consideration to construct a storage reservoir at Glenismaul for power purposes only, which it was expected would have raised the total power of the river to 2,000 h.p., but the reservoir was never constructed. It would, however, be interesting to discover, if possible, how and to what extent the operation of the existing compensation reservoir has affected the available power.

Where natural lakes are to be used as reservoirs it would generally be necessary to deepen the discharge outlet so as to use the existing water surface as the maximum level, and to be able to discharge the lake down to a lower level by a means of sluice gates when water was required, as in the vast majority of cases the raising of the existing levels of lakes would injuriously affect the drainage of agricultural land.

It would, however, be conceivable when the fall of the water from a lake used in one or more power-houses was considerable that it would be more economical forcibly to discharge the lake by means of centrifugal pumps driven by heat engines, during times of exceptional drought, instead of employing such engines as stand-by plant in the mills themselves. It may be mentioned in this connection that it has been proposed to obtain a range of level of 2ft. on Lough Ennell for improving the power derived from Brosna, and more recently to use Lough Allen as a storage reservoir in connection with the Shannon power scheme, a use for which it is specially suited, as the land rises steeply around the shores of the lake.

The levels of several lakes have already been controlled by drainage purposes, notably Lough Erne, the outfall of which at Belleek is provided with four sluices 29ft. wide by 15ft. high, made on Mr. Stoney's plan with rollers and operated by a small turbine; there are opened in time of heavy rain to prepare the lake for receiving the floods coming down into it, and are closed when the water is low in order to maintain the navigation, which extends over some sixty miles, on one level. Needless to say, these sudden violent discharges would not benefit works using the power between Belleek and the sea.

I propose now to give a description of a few places which I have had the opportunity of visiting where there appears to be water-power capable of being developed at reasonable cost, but which has up to the present been only partially used or not used at all; it must, however, be borne in mind that in the absence of reliable information it is necessary to see a river both in flood and in drought in order to form a true estimate of its value for the generation of power.

One must also remember that a small river is not to be despised provided a good fall and storage facilities can be obtained. For example, the river used for making aluminium at Foyers has a catchment of but little over one hundred square miles, being comparable in this respect with the Upper Bann; but having a magnificent fall of 350 feet and a storage reservoir capable of holding a supply for fifty days and self a water-power of very great importance.

One of the most attractive-looking water-powers I have met with is the outfall of the Ballysadare river, which enters the sea some 4½ miles from the town of Sligo. I have roughly measured the catchment area of the two rivers which unite a short distance above this fall, and find it about 250 square miles, which should give an average flow equivalent to 18 b.h.p. per foot of fall. The smaller of these two rivers drains Lough Arrow, which might possibly be used to some extent as a reservoir. The water descends a steep rapid at Ballysadare, at the bottom of which it pitches over a cliff into the sea; the total fall, as near as one could judge by eye, must be at least 60 feet. Two corn-mills, one on each side of the river, use a portion of the water, and a mere fraction of the fall, the total power of which must average about 1,000 h.p., if my estimate of the levels is correct. The larger of the two streams which unite above Ballysadare has a good fall on it at Collooney, about two miles distant, and works were in progress some two years ago for developing the surplus power there, a portion being already in use driving a large corn-mill. The head available is at least 40 feet. Both the Ballysadare and Collooney falls are situated in close proximity to railway stations; they are, moreover, so near to Sligo that the power from either or both might be used for lighting that town. Some thirty miles to the north-east we come to another water-power of greater magnitude, but one which would involve much greater engineering works for its complete development. I refer to the outfall of the river Erne, which enters the sea at Ballyshannon.

Here the river running over a compact limestone rock takes a final leap into the sea, the fall being about 10 feet at high water and over 20 feet at low water, and the average flow being equivalent to 120 H.P. per foot of fall, so that there should be from 1,200 to 2,400 H.P. available, according to the state of the tide. Two mills are in existence at this fall, capable of using between them 250 H.P. at most. Owing to the great value of the salmon and eel fisheries in the river it is doubtful whether any large hydraulic works could be undertaken without buying up these fisheries at a heavy cost in the first instance. The operation of the drainage sluices at Bel-

leek has also to be considered, as they cause excessive discharges through the river when opened to any extent. About a mile higher up the river there is a considerable natural fall called the Falls of Lora, where the water rushes through a narrow rock channel, and possibly a fall up to 15 feet might be obtained here. The whole course of the river from Belleek to the sea is rapid, with steep banks, and should therefore lend itself to the development of power by means of weirs suitably placed. At Belleek itself a fall of about 12 feet exists between the lake and the river, and a small fraction of the water is used to drive the pottery works producing the well-known Belleek china, but the vast bulk of the water passes continually through a byewash without doing any useful work.

The average natural power between Lough Erne and the sea cannot be far short of 18,000 H.P., and being distributed in the short distance of five miles, a very considerable portion of this should be capable of being used. Higher up on the river Erne there are falls at Butler's Bridge in Cavan, and on a tributary, the Annalee, near Ballyhaise; there must also be available power between Lough Gowna and Lough Oughter, as there is a fall of 54 feet between these lakes. I have not, however, seen these places.

If we turn now to the Galway district we find the river Corrib, draining some 1,370 square miles, falls into the sea in the town of Galway, the fall being about 14 feet. Some of the power is in use, and possibly in summer there is scarcely enough power for the existing mills, since the electric light station, which has 200 H.P. from the river, has also a gas engine as a stand-by. During a large part of the year, however, a great body of surplus water passes down into the sea,

A greater and more reliable water power could be obtained in this district by using the fall of some 37 feet which exists between Lough Mask and Lough Corrib. The overflow from the former lake at present passes by an underground river into Lough Corrib near Cong, where the distance between the lakes is about two miles. A considerable portion of the whole catchment of the Corrib river, 1,374 square miles in all, delivers into Lough Mask, and it is probable that as much as 2,500 continuous H.P. could be obtained here provided it were possible to prevent any great leakage between the two lakes. There is, moreover, a great advantage in drawing water direct from a lake, as in this case, instead of from a river, since the water can be expended rapidly or slowly as required, and whenever the turbine is not in use the water is being stored, provided the lake is not overflowing; the large size of the lower lake, at the same time, would prevent inequalities of discharge affecting the outflow at Galway. Although Cong is situated in an out-of-the-way place, yet the navigation of the Corrib river and lake would enable materials for manufacturing purposes to be brought cheaply to and from the sea at Galway.

There is said to be a fall of 27 feet at the outfall of the Lakes Conn and Colin, which discharge by the river Moy in North Mayo and form a counterpart to the Galway lakes, but I have no precise information on the subject.

The lakes in the Mullingar district are of importance in connection with our subject owing to their comparatively high level. The highest, Lough Owel, is 329 feet over the sea, and serves to feed the top level of the Royal Canal, the water of which I believe is used to run the lighting of the railway station at Mullingar, the canal level at this point being some fifty feet over the Brosna, into which the tail water is discharged. The above-mentioned canal, as it approaches Dublin, passes over the Rye river at Leixlip station at a very considerable elevation, and a valuable power could be obtained here by discharging the surplus water of the canal. The long levels on the canal at this point would act well as storage reservoirs, and power for lighting the terminus at Dublin, and possibly for lighting and driving the railway works, might be so obtained; the average power would be chiefly limited by the effect of flow in the canal upon the haulage of boats.

The mention of Leixlip brings to one's mind the river Liffey, which here presents so pretty a picture. The total fall on the Liffey at the Salmon Leap must be some 35 feet, and as the river at this point would seldom have a flow less than an equivalent to 12 H.P. per foot of fall, the available power should amount to 400 H.P.; a portion of this power is already in use, but there should be, at least, between 200 and 300 H.P. surplus. The upper portion of the catchment area of the Liffey in the Wicklow Mountains is of such a nature that the water flows off rapidly into the river after rain, like water off the roof of a house, and the river is subject to freshets of short duration after a few hours' heavy rain at any time. This was very striking after the dry weather last summer, as two or three freshets came down the Liffey before the small streams in the Meath districts, which had dried up, began to flow again. It is certain that much more than one-third of the rainfall over the catchment above Poulaphouca passes to the sea through the river, as it is known that as much as 60 to 80 per cent of the rainfall may run off from granite rock and moorland, of which a large part of this area consists. Should it, therefore, ever be contemplated to develop the power of this river in a systematic manner, it would be of the utmost importance to construct an impounding reservoir somewhere above Poulaphouca Fall so as to impound these numerous sudden rushes of storm water, and thus equalise the flow of the river, reducing at the same time the violence of the floods.

The remarkable flood in November last caused the black water to rise above the level of the weir at Island Bridge, where there is a fall of something like 14 feet under ordinary circumstances, and no doubt all the mills along the lower part of the river were stopped by excess of water on this occasion. The level of the Liffey just above the fall at Poulaphuca is over 500 feet above the sea, so that a great quantity of energy would be stored in the proposed reservoir per acre covered.

I regret that I have no information about the Boyne and Blackwater except as regards the fall at Slane, which appears to be from 4½ to 5 feet, and to point out that Lough Ramor, situated at an elevation of 277 feet at the head of the Blackwater, should be valuable as a storage basin for these rivers. Neither have I been able to obtain much information as to the rivers in the southern part of the country, with which I am not very familiar.

Many small powers exist scattered through the country which are not of enough importance to be considered here, and which have no neighbouring powers with which they could be agglomerated for purposes of transmission. These small powers may, however, in the future, be utilised electrically with great advantage for the operation of creameries and for working threshing machines, and for other agricultural operations, as well as for electric lighting, inasmuch as small steam engines are notoriously extravagant in fuel, and fuel itself is very costly in some districts, owing to the heavy expense of railway carriage and cartage.

In conclusion I must apologise for the numerous instances in which I have been unable to give definite information in regard to the subject, the data having been mostly collected during holiday time and not with a view to publication of any kind. My object in bringing the subject forward is rather to draw attention to the fact that water-power of considerable value exists in the country, and that the time has arrived when a careful survey of this power should be made as a first step towards its employment for industrial purposes.

(Concluded from last week.)

ANCIENT BEVERAGES OF IRELAND.

At what period the art of distillation was introduced into Britain is not certainly known: it is commonly believed to have taken place during the reign of Henry II. It would appear that in Ireland the practice of obtaining a spirit from malt was better understood, even at the earliest period of the invention, than elsewhere. In the Irish language the spirit was called Uisge-beatha or Usquebah. Moryson, who was secretary to Lord Mountjoy, during the rebellion of the Earl of Tyrone, wrote a history of Ireland, including the period between 1599 and 1603, which in many respects is one of the grossest libels that ever defiled the page of history. In this he, nevertheless, gives the following account:—"At Dublin and in some other cities (of Ireland) they have taverns, wherein Spanish and French wines are sold; but more commonly the merchants sell them by pints and quarts in their own cellars. The Irish aqua vitæ, vulgarly called usquebagh, is held the best in the world of that kind, which is made also in England, but nothing so good as that which is brought out of Ireland. And the usquebagh is preferred before our aqua vitæ, because the mingling of raisins, fennel seed, and other things, mitigating the heat, and making the taste pleasant, makes it less inflame, and yet refresh the weak stomach with moderate heat and good relish. These drinks the English-Irish drink largely, and in many families, especially at feasts, both men and women use excess therein. Neither have they any beer made of malt and hops, nor yet any ale; no, not the chief lords, except it be very rarely. But when they come to any market town to sell a car or horse, they never return home until they have drunk the price in Spanish wine (which they call the King of Spain's daughter), or in Irish usquebagh, and until they have outslept two or three days' drunkenness. The latter passages prove how little this writer was disposed to praise anything Irish, had praise been undeserved.

Sir James Ware supposes that ardent spirit was distilled in Ireland earlier than in England. He says—"The English aqua vitæ, it is thought, is the invention of more modern times. Yet we find the virtues of usquebagh and a receipt for making it, both simple and compound, in the red book of Ossory, compiled nearly two hundred years ago; and another receipt for making a liquor called nectar, made of a mixture of honey and wine, to which are added ginger, pepper, cinnamon, and other ingredients." Dr. Ledwich observes that the early French poets speak of this nectar with rapture, as being most delicious. The Irish distilled spirits from malt in 1580, and imitated foreign liqueurs by adding aromatic seeds and spices, as was practiced in France so early, according to le Grand, as 1313. The Irish bulcaan, Rutty tells us, was made from black oats. Buile, madness, and ceann, the head, intimate the effects of this fiery spirit.

TO ———.

How beautiful is music when it falls
Softly and sweet, upon the lonely ear,
What thoughts of other days its tone recalls,
Claiming from pensive memory a tear.
How beautiful is music, in the halls
Where mirth and joy, and jocund dance appear;
And lights, and banners streaming from the walls:
And revelry, that even grief might cheer.
But sweeter far to me doth music seem,
When nor alone, nor mingling in the throng,
I listen with delight, while many a dream
Of wand'ring fancy mingles with the song,
And mark, the while, what pleasure and surprise,
Beam in thy soft and sweetly-speaking eyes.

I.

At the last monthly meeting of the Quebec Board of Trade the secretary read the minutes of the previous meeting in the French language. This was a distinct innovation in the procedure of the board, and was the first time since its foundation more than one hundred years ago, that the minutes had been read in French. There was a large attendance at the meeting, but the reading was listened to in silence, and when the time came to have the minutes read in English the cry of "Dispense" was raised and it prevailed.

LITERARY NOTES.

The "Literary World" recently fell into an extraordinary error. "Mr. Gilbert Parker's oratory," it says, "comes up to the expectations we generally form of budding Parliamentarians, as represented, for instance, by Mr. Rider Haggard in the last Parliament." Mr. Rider Haggard has never been in Parliament, and only tried once, in 1895, when he fought an election that became famous.

✧ ✧ ✧

A recent literary anniversary was the birthday of Mr. Andrew Lang; another that of the birthday of Lady Dorothy Nevill. A daughter of the third Earl of Oxford, she has written a history of the Walpoles. She was the "Dearest Dorothy" of Lord Beaconsfield's still unpublished letters, and was a near neighbour of his during the happiest years of his life, when he occupied the house at Grosvenor-gate, Park-lane, which was a part of Lady Beaconsfield's property alienated from him by her death.

✧ ✧ ✧

The pronunciation of the syllable "ough" causes difficulty not only to foreigners but also occasionally to persons who have never spoken any language but English. From an old number of "Notes and Queries" a correspondent has dug the following verses, which make more for confusion than for guidance:—

'Tis not an easy task to show
How o-u-g-h sounds! Since though
An Irish Lough, and English Slough,
And Cough and Hiccough, all allow,
Differ as much as Tough and Through;
There seems no reason why they do!

✧ ✧ ✧

Mr. Andrew Lang since 1872 has contributed nearly sixty volumes to literature. The old Baliol scholar, who has just passed the fifty-eighth milestone of life's journey, has been an untiring worker. His works possess a delightful variety. Sometimes it is a fairy tale he desires to relate, then a volume of poems, to be followed by a biographical sketch or a scientific treatise; or perchance it is history he wishes to write, or something about literature. It is his wonderful versatility that has made him an attractive force in literary circles.

✧ ✧ ✧

Emile Zola was sixty-two on the 2nd inst. His best-known work is that series of twenty volumes treating of the offshoots of the Rougon-Macquart family, each volume a complete story in itself, but the whole constituting the greatest heredity novel of the age. "L'Assommoir," which has had most popularity in this country, was included in the series. In 1894-98 was published the series Lourdes, Rome, Paris; and since, "Fecondite," 1899, and "The Monomaniac," 1901. Zola has had intimate acquaintance with poverty, a fact that readers of his novels will not be slow to understand. He was quite a long way up the ladder when he was clerk to Hachette and Co. at £1 a week.

✧ ✧ ✧

Mrs. Amelia Barr, the novelist, who was born at Ulverstone, Lancashire, attained her seventy-first birthday last week. When left, at the age of thirty-five, a widow with three daughters, in Texas, Mrs. Barr went to New York, and began writing for Henry Ward Beecher's paper and other periodicals. She had passed her fiftieth birthday before she began novel-writing. The first of her characteristic works, "Jan Vedder's Wife," was published in 1885; during the intervening years some thirty works have come from her pen, the most popular being "The Squire of Sandal-Side," 1887; "Feet of Clay," 1889; "She Loved a Sailor," 1891; and "Prisoners of Conscience," 1897.

✧ ✧ ✧

Next October a ceremonial of a very interesting character will take place at Oxford—the celebration of the tercentenary of the Bodleian Library. It was on the 8th November, 1602, that the present library was thrown open. There was at Oxford a great library before the Bodleian. This was the collection founded by Humphrey, Duke of Gloucester, about 1450. After a century's existence, Duke Humphrey's collection was broken up and dispersed. The "University either could or would do nothing to repair the loss." So, at his own expense, Sir Thomas Bodley undertook to refill the shelves of Duke Humphrey's empty library, and to endow the institution.

✧ ✧ ✧

An interesting autograph of Guy Fawkes will during the season be offered for sale at Sotheby's auction rooms. The signature "Guy Fawkes"—not "Guido," the Italian spelling, as in other cases—is at the bottom, together with his seal of a parchment indenture dated the 1st August, in the thirty-fourth year (1591) of the reign of Queen Elizabeth. The deed refers to the sale of a farm and garden at Clifton, Yorkshire, between Guy Fawkes, of the city of York, and Dame Shipley, of Clifton, in the county of York, for the sum of £29 13s 3d of "good and lawfull Englysh money." The document is in perfect preservation, oblong in shape, about 15in. by 12in. Autographs of Guy Fawkes are rare.

✧ ✧ ✧

The Hon. Emily Lawless is known as a writer of sympathy and insight on Irish subjects. She knows her way among labyrinths of the Irish mind better than most authors who have occupied themselves with the Celtic temperament. A little volume of her poems is about to be issued by Messrs. Isbister and Co. "The Wild Geese" is to be its title, and the Irish exile is the theme. The "wild geese" of the Irish historico-political imagination were the Jacobite monarchists, who, after James the Second's final discomfiture, followed the King to France. The imagery was suggested by the wailing cry of the bird migrants. It is characteristic of Celtic sentiment. Mr. Stopford Brooke contributes to Miss Lawless's volume an historical introduction.

✧ ✧ ✧

Messrs. T. C. and E. C. Jack, of London and Edinburgh, are preparing to issue an English version of Herr Strohl's sumptuous and famous work, "The Heraldic Atlas." This work was brought out at Stuggart in 1899. A large part of the Atlas appeals to English readers equally with German, for the "Atlas" deals with all periods, and every country in Europe. The English version will be edited by Mr. A. C. Fox-Davies, under the title of "The Art of Heraldry: An Encyclopædia of Armory." It will reproduce the entire series of Herr Strohl's coloured plates, as also the illustration blocks, and contain a large addition of new illustrations from a British point of view. The section on laws of Armory will be entirely rewritten. Mr. Fox-Davies is the well-known editor of "Armorial Families." To the forthcoming volume he will contribute additional chapters on subjects not included in the German original. The translation will include 70 or more folio full-page illustrations in colour, besides several hundreds of new drawings. Among these last there will be specimens of the work of G. W. Eve, Graham Johnston, Forbes Nixon, G. Scruby, and Miss Helard.

✧ ✧ ✧

Mrs. E. M. Ward has been "commanded" to make two copies of the official portrait Mr. Luke Fildes is painting of King Edward. Few women artists have such a busy career as Mrs. Ward. She exhibited her first picture more than half a century ago. For many years past she has done but little original work, her art school making very heavy demands upon her time. Her school was for many years the fashionable art school of London. She has had more than one royal student. Mrs. Ward comes of artistic stock, and a love of art is in her blood. Her husband was also an artist, and she owes something of her skill to his training. Mrs. Ward has many interesting stories to tell of the difficulties girl students had to encounter. She was the first woman to put in an appearance at the R.A. lectures. There was no rule against women attending, but prejudice existed against their doing so, and this principle was within an ace of becoming a rule. Mrs. Ward, however, supported by the presence of her husband, appeared at one of Mr. G. D. Leslie's lectures. There were three women at the next, and from that time on students of both sexes have attended the lectures. Her daughters are both artists, and her son is Mr. Leslie Ward, better known as "Spy" of "Vanity Fair."

✧ ✧ ✧

Mr. B. Dobell has given us a charming reprint of the original first edition of Goldsmith's "A Prospect of Society," which was the earliest form of his poem, "The Travellers." The dedication in verse is to Austin Dobson:—

To you, a poet, I,
A rhymer, send
These lines, that I,
For once, may call you friend.

✧ ✧ ✧

Professor Arminus Vambery, upon whom the King has recently conferred the Victorian Order, has had one of the most romantic careers of modern times. Fatherless, lame, and almost penniless, he was compelled when a mere child to shift for himself; but so determined was he to conquer fortune that he immediately set about acquiring knowledge as the best way of raising himself above his mean surroundings. Up to the age of eighteen his life was a constant struggle against starvation, yet by the time he had reached his twentieth year he had become one of the most accomplished linguists in Europe. His most famous feat was his great journey through Central Asia. For this journey he adopted the dress of a dervish, and travelled to Khiva with a herd of fanatics, who, had they discovered him, would have torn him to pieces. He visited Bokhara, Samarkand, and all the Oxus country in complete safety. Vambery is now Professor of Oriental languages in the University of Pesth. In 1883 he published, through Mr. T. Fisher Unwin, an account of his life and adventures, which has passed through many editions. His "Story of Hungary," in the "Nations Series," is a noteworthy volume, as it was the first history of Hungary written in English.

✧ ✧ ✧

Disraeli has very often been accused of plagiarism, both in his speeches and in his novels, but in most cases the plagiarisms could not be properly proved. But a writer in a contemporary calls attention to an obvious plagiarism in "Vivian Grey," from Sidney's "Arcadia," which has not hitherto been noticed. In "Vivian Grey," book 7, chapter 8, the following passage occurs:—"How gracefully their colonel, the younger Count of Eberstein, bounds on his barb! Has Theseus turned Centaur? His spur and bridle seem rather the emblems of sovereignity than the instruments of government; he neither chastises nor directs. The rider moves without motion, and the horse judges without guidance. It would seem that the man had borrowed the beast's body and the beast the man's mind." In the second book of the "Arcadia" occurs the following passage which Disraeli may, of course, have recalled unconsciously, but, if so, it was a fine feat of memory:—"But, oh, how well it did with Dorus—to see with what a grace he presented himself before me on horseback. . . . But he as if, Centaur-like, he had been on piece one with the horse, was no more moved than one with the going of his own legs, and in effect so did he comand him as his own limbs, for though he had both spurs and wand they seemed rather marks of sovereignty than instruments of punishment, his hand and leg, with most pleasing grace, commanding without threatening, and rather remembering than chastising. At least, if sometimes he did, it wes so stolen as neither our eyes could discern it nor the horse with any change did complain of it, he ever going so just with the horse, either forthright or turning, that it seemed as he borrowed the horse's body so he lent the horse his mind."

SCIENTIFIC TOPICS.

A speed of 105 miles per hour has been attained on the Zossen experimental electric railway. The main tests are to be at a speed of 125 miles per hour.

✧ ✧ ✧

The West Virginia University has recently received a gift of a passenger locomotive from the Baltimore and Ohio Railroad for experimental use in its new engineering building.

✧ ✧ ✧

In one day 39,200 tons of iron were recently shipped from Ashtubula to the Pittsburg furnaces; fifty-five trains were handled in twenty-four hours, sixty-five locomotives being used; thirty-four locomotives and fifteen crews were borrowed from the main line for the occasion.

✧ ✧ ✧

A cinematograph picture has been taken of the Severn bore. It is believed that this is the first moving picture of a tidal bore. The film is 150 feet long, and contains 2,400 individual pictures. About half the length is devoted to the bore itself, and the remainder shows the rapid current which follows and the filling up of the river.

✧ ✧ ✧

The total production of crude petroleum in the United States in 1900 was 63,362,704 barrels, being the largest for any year in the history of the States. It was 6,291,854 barrels larger than that of 1889, the increase amounting to a little over 11 per cent. as compared with 3 per cent. gain in 1899 over that of 1898. It was greater by 2,402,343 barrels than the previous largest production, that of 1896.

✧ ✧ ✧

Prof. Charles Wilson has announced a new determination of the temperature of the sun, which, with due allowance for slight unavoidable errors, is placed at 6,200 degrees centigrade (11,192 Fahr.) If the probable absorption of the sun's radiated heat by its own atmosphere is allowed for, the mean temperature of the sun's body is placed at 6,600 degrees centigrade. Prof. Wilson started his calculations almost ten years ago.

✧ ✧ ✧

A Brooklyn (N.Y.) genius has secured a patent for a curious device for creating energy by feeding a tape of explosive caps into a chamber where they are successively exploded by a mechanically-driven hammer. The resulting gas from each explosion passes into a pressure storage chamber, whence it is drawn into an engine in a manner similar to that in which steam is taken from a boiler into a steam engine.

✧ ✧ ✧

The travelling radius of electric vehicles, even in large cities, being necessarily limited by the scarcity of charging stations, a Brooklyn (N.Y.) physician has perfected a scheme whereby he can replenish his batteries from the omnipresent trolley wires. As such action, without permission, would constitute larceny, he has attached an electrometer to his carriage, and is prepared, in the event of the officials' acquiescence, to pay for all electricity so "borrowed."

✧ ✧ ✧

While drilling for oil in the Colorado desert in Southern California, the drilling-tools, which reached a depth of 500 feet, were suddenly thrown out, and the well began to spout hot water and steam. Volcanic substances were showered about the surounding country, and the men lost no time in escaping from the derrick. Some distance from the point where the well was drilled is a region where signs of volcanic conditions underneath frequently appear, and it was thought that the well was drilled down to this stratum.

✧ ✧ ✧

A curious accident was caused recently by a cat climbing a pole of the Buffalo and Lockport Electric Railway. While attempting to walk along the feed wires her tail touched one of the 22,000-volt Niagara transmission lines. The cat was instantly killed, but a short circuit was caused by the body falling across the wires; this resulted in shutting off the power at Niagara for two hours. Several electric railways and lighting systems in western New York were without power. The next day another cat in Utica, N.Y., prowling around the power house in Utica, also caused a short circuit, which resulted in blowing out several fuses, and the cars were stalled for some time. The cat, however, was not injured, and still lives.

✧ ✧ ✧

An automobile service has been recently inaugurated in the city of Hamilton, Ohio. Three omnibuses, with a capacity of twenty passengers each, are in operation running through the city, and making connection with the line of the Mill Creek Electric Railway Company, which corporation has never been able to secure permission to enter the city with tracks. The latter line operates between Hamilton and Cincinnati, and it was compelled to put the automobiles in operation in order to accommodate its patrons between these two points.

✧ ✧ ✧

An important invention by Herr Rudolf Bartedmus, an electrician of Vienna, for the prevention of railway acoidents, has been subjected to severe experiments by the Austrian Railway Officials' Club. The locomotive for the purpose was worked automatically by means of a contact rail along the entire distance, combined with a dynamo and a steam turbine. In case of any obstruction being encountered on the line, the newly invented device works as a progressive check. That is to say, it gives notice first at a distance of 2,400 yards, then at 1,200 yards, and finally, if the previous signals remain unheeded, at 600 yards from the obstruction the steam is automatically shut off on the engine, so that the train comes to a standstill.

✧ ✧ ✧

Sir W. H. Preece, formerly chief electrician to the G.P.O., London, has been engaged for some time past upon a study of the magnetic influences upon the compass of the Manacles Rocks off the coast of Cornwall, and upon which the steamships "Mohegan" and "Paris" were wrecked. Sir William Preece states, as the result of his investigation, that if any navigator sets his course from Cherbourg to the Lizard without knowing the variation of the magnet that has occurred during the past five or six years, he would run upon the Manacles. The variation was bringing the needle nearer to the North Pole, and in ten years it varied a whole degree. The difference of a degree in a magnet signified an error of one mile in a course of sixty miles, so that unless the captain's observations were maintained with all accuracy and care, if the Admiralty did not correct their charts from time to time, and if captains of ships did not make themselves acquainted with these different errors, then sooner or later disaster was certain to occur.

✧ ✧ ✧

M. E. Ducretet, a well-known electrician of Paris, has been making some interesting experiments in telephonic transmission by using the earth alone as a conductor. The transmitter in this case consists of a microphone and a few cells of battery connected directly to two earth plates of considerable surface, and buried 6 feet below the ground. The plates are placed facing each other, and only a few yards apart. From the receiver he makes use of a quarry well, about 60 feet deep, which communicates below with the Catacombs. The orifice terminates at the ground level by a cast-iron pipe 4 inches in diameter and 12 feet long. An insulated conductor descends in the vertical well and brings a metal sphere 3 inches in diameter in contact with the soil of the Catacombs. On coming out of the well the wire is fixed to one end of an ordinary telephone receiver, whose other end is connected with the iron pipe at the surface of the ground. The two earth circuits which are thus made are separated by a building with cellars and thick walls, and therefore the layer which separates the two parts is considerable. When the microphone is spoken into, all the vibrations of the voice, even the feeblest, give rise to variations of current in the circuit which is closed through the earth, without any metallic connection between the two parts, and in spite of the multiple variations of the currents and the nature of the medium earth, which is used, the reproduction of the voice is made at the receiving end with remarkable sharpness, and, besides, there are none of the extraneous noises which are so common in the ordinary circuits.

✧ ✧ ✧

To the city of San Francisco is shortly to belong the distinction of being served by considerably the longest transmission of electrical power in the world. Hydraulic-electric power has for some time been carried in California for a distance of over two hundred miles. The credit of this installation is due to the Bay Counties Power Company, California, whose line extends from the Colgate power house located in the Sierra Nevada Mountains, to Oakland, on San Francisco Bay, a distance of 142 miles. At this city the lines connect with those of the Standard Electric Company, which reach from Oakland to San Jose, a further distance of 42 miles, and thence to Redwood City, which is distant 191 miles from the Colgate power house. At Colgate connection is made with the lines of the Consolidated Light and Power Company, which extends to Burlingame, a further distance of 11 miles. The total distance of transmission thus accomplished is 202 miles. The completion of the high-tension line of the Standard Electric Company to San Francisco will render possible transmission from the power house in the Sierra Nevada Mountains to the sub-station in San Francisco, a distance of 220 miles. This feat, which is quite without a parallel, will be naturally compared with the Lauffen-Frankfort transmission of 110 miles, which was made in 1891, and it will be seen that the distance has been doubled in about a decade. The explanation of the great distance to which the transmission has been successfully accomplished in California is to be found partly in the favourable climatic conditions of that State.

✧ ✧ ✧

A curious case recently came up for decision in the German Empire, which may be of some value to our readers as a precedent in its way. A well-known opera singer had phonographic records of certain of his songs made for public sale. A manufacturer of phonographs purchased some of these records, and reproduced them in large numbers by means of a new duplicating process. The duplicates were sold, and an action was brought against the manufacturer by the opera singer, who claimed that he was entitled to some legal protection. The court granted his claim. The German law of June 11, 1870, relating to the right of an author to his written work, drawings, musical compositions, and dramatic works, is intended to prevent the wrongful use of intellectual products, by forbidding their mechanical reproduction. Reasoning by analogy, the plaintiff in the present case claimed that he was entitled to the protection afforded by this statute. But the question arose: Could a song be considered an intellectual product? It is true that the utterances of the human voice, broadly speaking, cannot be protected legally. But in order to be able to sing, there must be not only the natural ability to produce melodious tones, but also persevering study to produce those tones with artistic feeling. In other words, it is not the sound of the voice itself which an audience desires to hear, but also intelligent interpretation. After the Court had, therefore, analysed the human voice, and especially the singing voice, with true German philosophic thoroughness, it came to the conclusion that the song of a trained singer is, indeed, an intellectual product, and as such is fully entitled to the protection afforded by the Act of June 11, 1870.

GLIMPSES OF THE PAST.

From the Dublin Newspapers of 1793.

APRIL 4.—Monday last came on at Cavan the election of a knight of the shire for the county of Cavan, in the room of Charles Steuart, Esq., deceased, when Lord Maxwell, eldest son of the Earl of Farnham, was elected without any opposition.

Monday, the 9th, being the aniversary meeting of the Dublin Medical Society, the following gentlemen were unanimously elected officers for the ensuing year:—

Matthew Stritch, Esq., M.D., and Laurence Crofton, Esq., M.D., Presidents.

John Creighton and Thomas Wright, Esqrs., Licentiates of the Royal College of Surgeons.

Thomas Beatty, Esq., M.D., Treasurer.

Mr. Robert Coombs, A.B., T.C.D., Secretary.

Mr. M. Toomy, A.B., T.C.D., Librarian.

Copy of a letter from Mr. Edgworth, priest, in Paris, to Mr. Maffey, priest, in London, dated about six weeks before the execution of Louis XV., gives such a striking proof of the zeal and heroic resignation of the writer, as well as his just opinion of the happy constitution of England, that we are induced to publish it even at this late period—viz:—

You are undoubtedly surprised, my dear and honoured friend, that whilst the clergy of France are flocking to England for Christian shelter and support, I should remain here, amidst the ruins of this afflicted persecuted church. Indeed, I have often wished to fly to that land of true liberty and solid peace, and to share with others your hospitable board; where, to be a stranger, in distress, is a sufficient title. But Almighty God has baffled my measures, and ties me to this land of horrors by chains which I have not the liberty to shake off! The case is this: The wretched master charges me not to quit the country, as I am the person whom he intends to prepare him for death. And should the iniquity of the nation commit that last act of cruelty, I must also prepare myself for death, as I am convinced the popular rage will not allow me to survive an hour after the tragic scene; but I am resigned; my life is of no consequence; the preservation of it, or the shedding of my blood, is not connected with the happiness of millions. Could my life save him, I would willingly lay it down, and I shoud not die in vain. Receive this unfeigned assurance (perhaps for the last time) of my respect and affection for you, which, I hope, even death will not destroy.

The Right Hon. the Earl of Granard is appointed colonel of the militia for the county of Longford; and the Right Hon. the Earl of Westmeath, colonel of the militia of the county of Westmeath.

Henry Gore Sankey, Esq., one of the aldermen of this city, is appointed colonel of his Majesty's militia for the county of the city of Dublin.

Another message was brought down from the board intimating that they had granted to Patrick Duigenan, LL.D., the freedom of the city of Dublin, and requiring the concurrence of the Commons thereto.

The question being put, a ballot ensued, when there appeared:—

For the freedom	62
Against it	46
Majority	16

APRIL 13.—The Assixes for the populous extensive, and commercial county of Antrim was finished in two days, beside the Commission day. There were not any capital indictments whatever. The only indictment which had excited the public attention was one at the suit of the Crown against Mr. Joseph Cuthbert, of Belfast, for having delivered an extract from a pamphlet, published by Mr. Cooper, of Manchester, to a soldier of the 55th Regiment.

Mr. Caldbeck (Associate Judge) presided at this trial.

Mr. Cuthbert was found guilty. Sentence—One year's imprisonment, and pillory one hour in Belfast.

The counsel on both sides acquitted themselves with very great ability throughout the whole of the trial, which lasted from ten o'clock in the morning until eight at night.

The following points of law were urged and admitted at the above trial, and not being generally understood, we lay them before our readers:—

1st. A traverser is not entitled to a copy of the indictment.

2nd. The King cannot be nonsuited through any defect or imperfection in the indictment.

3rd. The Crown can object to jurors absolutely—a traverser cannot without showing cause.

4th. The Court has a right to put off the trial without showing cause—the traverser cannot without affidavit of cause.

Counsel for the Crown—Messrs. Sheridan, Dunn, M'Cartney, Ruxton, Saurin, Dawson. Agent, Crown Solicitor. For the traversers—Messrs. Blackburne, Dobbs, Stewart, Sampson. Agent, Thomas L. Stewart.

Mr. Cuthbert was brought to Belfast, escorted by a troop of the 17th Dragoons, and, after having been detained in the barracks for some time, was pillored, in company with a culprit who had been found guilty of firing at an excise-officer. The pillory was surrounded by the 55th Regiment, who were formed into a hollow square for the purpose; around them, at some distance, were placed the troop of horse; and, during the period, a body of horse (which had been brought from Lisburn, etc.) was stationed at the Saltwater bridge, and another at the end of Long bridge.

At Tralee Assizes the only business of consequence that came before the judges, was the trial of Lieutenant Carr, of the 40th Regiment of Foot, indicted for the wilful murder of Mr. O'Connell, by shooting him with a pistol.

It appeared in evidence, that Lieutenant Danser had carried a challenge from Carr to O'Connell; that the parties met, and, each having a brace of pistols, took their ground at ten yards distance, when it was agreed they should fire together, at a word to be given by Mr. Blennerhasset, second to Mr. O'Connell. On the word being given, Mr. O'Connell fired, and missed his opponent; who returned his shot, not instantly, but in about four seconds, which entered Mr. O'Connell's side, and wounded him mortally.

The counsel for the prosecution offered in evidence an information given by the deceased, which was objected to by the counsel for the prisoner, with great ingenuity and legal knowledge; and Captain Edwards, Ensign Hart, and others, were then examined to show that the prisoner did not retain his fire for any malicious purpose; and the judge, having charged the jury, that unless it appeared to them that the prisoner retained his fire from a rancorous or malicious motive, they could not find him guilty of murder. They brought in their verdict manslaughter.

Counsel for the prosecution—Messrs. White, Blennerhasset, Rowan, Franks, and Stephen Rice.

Counsel for the prisoner—Messrs. Keller, Quin, and Emmet.

Mr. Carr was the next day admitted to bail, conditionally, that he would surrender, or plead his pardon for the manslaughter on the first day of next Assizes.

Yesterday a quarterly assembly of the Lord Mayor, aldermen, sheriffs, and commons of the city of Dublin was held at the Exhibition House, William street.

A number of freemen in the different corporations had their freedom confirmed, and much routine business was transacted.

A message was brought down from the Upper House to the Commons, intimating that the board had agreed to an order that the city treasurer do pay, on the warrant of the Lord Mayor, the amount of the gold box, voted, with the thanks of the Corporation to Henry Gore Sankey, Esq., late Lord Mayor, and of two silver boxes to Benjamin Gault and John Norton, Esqrs., late Sheriffs, for their conduct in their respective departments, requesting the concurrence of the sheriffs and Commons therein.

The message being read, and the question put thereon, it was agreed to nem. con.

APRIL 17.—Wednesday being the first sitting day of Easter term, grand juries for the county and city of Dublin were sworn in the Court of King's Bench.

The following are the present term grand jury for the county of Dublin:—

Sir John Traile, of Welfield, Knt.
*Francis Cruise, of Belgard, Esq.
Abel Onge, of Hayestown, Esq.
John White, of Primrose hill, Esq.
Henry Steevens Reilly, of Prussia street, Esq.
*Edward Byrne, of Great George's street, Rutland square, Esq.
*Barry Lawless, of Shankhill, Esq.
*Andrew Savage, of Sybil hill, Esq.
Hans Hamilton, of Holmpatrick, Esq.
*John Ball, of Eccles street, Esq.
*Nicholas Le Favre, of Stillorgan, Esq.
*John Berford, of Broomfield, Esq.
*Thomas Fitzsimons, of Glancullen, Esq.
John Patrickson, of Harcourt street, Esq.
John Allen, of Stillorgan Park, Esq.
*John Keogh, of Mount Jerome, Esq.
*Christopher Taylor, of Swords, Esq.
*Michael Keogh, of Crumlin, Esq.
Thomas Ashworth, of Donnybrook, Esq.
St. George O'Kelly, of Stillorgan Park, Esq.
Robert Hutchinson, of Wespalstown, Esq.
Thomas Wildridge, of Harcourt street, Esq.
*Adam Ledwich, of Killaroe, Esq.

The liberality of sentiment which induced the High Sheriff of the county of Dublin to return on his panel so many respectable Roman Catholic gentlemen to serve on the grand jury, reflects upon him the highest credit. It was highly praiseworthy to find that, after the Bill for the relief of his Majesty's Roman Catholic subjects had passed into a law, the Sheriff of the county of Dublin took the earliest opportunity of carrying into effect his Majesty's gracious recommendation in favour of his Roman Catholic subjects of this kingdom.

(To be continued.)

(Those marked thus * are Roman Catholics.)

VOL. I., No. 3.] DUBLIN: SATURDAY, APRIL 19, 1902. [PRICE ONE PENNY.

ATHY IN 1793.

From a plate by Brocas in "Anthologia Hibernica."

In publishing the above engraving, in its issue for May, 1793, the "Anthologia Hibernica" wrote as follows:—

The borough of Athy, in the county of Kildare, in the barony of Narragh and Rheban, is situated on the river Barrow. The neighbouring country is pleasant, a limestone soil, better adapted for agriculture than pasturage. The place where the town now stands was an ancient ford, leading from the principality of Leix or Lavinghfeagh in the Queen's county to that of Celleagh or Caellan in the county of Kildare, and called "Ath-Bhiodhbha," pronounced Athy, that is the ford of adversary, and "Ath-Urcdain" or the ford of conflict, from a battle said by Keating to have been fought here in the second or third century, between the people of Munster and those of Leix under Lavighfeagh Cean Mordha (a). But the town owes its foundation to two monasteries erected on each side of the river, at the entrance of an extensive wood, in the 13th century. That on the west side of the river was founded by Richard de St. Michael Lord of Rheban, under the invocation of St. John, or rather St. Thomas, for crouched friars. The precincts of this monastery extended from the river at the foot of the bridge, containing all that part of the town called St. John, and St. John's-lane; and the domain consisted of the island in the river and the adjacent fields as far as the present barracks (b). This friary with its appurtenances at the dissolution was granted in August, 1575, to Anthony Power, which, reverting to the crown, was granted by act of parliament of the 17th and 18th of Charles 2d, to dame Mary Meredith (c). Part of the walls of the church still remain.

The monastery on the east side of the river was founded in 1253 by the families of the Boifels and Hogans, for Dominicans (d). Its precincts extended from the river along the north side of the present church to the corner of the street leading to Preston's-gate, and from thence to the gate and to the rear of the gardens of the present house called the Abbey (e). The domain consisted of six messuages in Le More, the present new town; the islands in the barrow and the fields adjacent con-

(e) From tradition of old inhabitants.

taining 12a. 2r. 1p. of land, with one acre of heath in the lands of Ardee; also two fishing weirs on the barrow, and a water mill at Tullognorer (f). All of which were granted on the 24th of January, the 35th of king Henry 8th A.D. 1544, to Martin Pelles, in capite for ever, at the annual rent of 2s. 8d. Irish money. No remains of this Abbey now exist, except the postern-gate, commonly and corruptly called Preston's-gate.

From these two monasteries the place was denominated "Bally da Dhae," or "Bla Theagh," pronounced "Blahai" or the town of two houses, which name it still retains in Irish. As the monasteries were founded by the English settlers, not only the monks but the inhabitants of the town were principally of that nation, to whom were early granted the immunities of a merchant or market town, such as fairs and markets, with the authority to levy customs and tolls, and as such is mentioned prior to the beginning of the 15th century. But which customs by an act of parliament in 25th of Henry 6th, A.D. 1448, were to be charged only on goods sold and exposed to sale in the town, and not on those carried on the road through the town, or bought or sold out of it.

In 1309 Lord John de Bonneville, slain near the town of Arstol or Ascul, was interred in the church of the Abbey of St. John (g), and the year before the town was burnt by the Irish.

In 1315 Athy was plundered by the Scots under Robert Bruce, who gained the battle of Ascul, in which were slain Haymond le Grace and Sir William Pendergrest, and on the side of the Scots, Sir Fergus Andressan and Sir Walter Murry (h). All of whom were buried in the dominican Abbey, Athy.

In 1317, Sir John Athy, a native of this town, took at sea the famous pirate Thomas Dover, cut off his head and brought it to Dublin (i).

In 1347 a dispute arose between the monasteries relative to the fishing weir of the dominicans, when the prior of St. John's, with some others, were indicted for stealing fish out of it, to the damage of 100s. and upwards (k).

About the year 1424 Thomas the seventh Earl of Kildare, then Lord Offaly, married Dorothea, daughter of Anthony O'More of Leix, and with her obtained the manors of Rheban and Woodstock, and in them erected a court baron and court leet, which are still held. Woodstock had been built about the time of the foundation of St. John's Abbey, by Richard St. Michael, Lord of Rheban, as an appendage to the palatinate of Dunnamaes granted to the Earl of Pembroke, and situated at the entrance of a wood now no more. Dunnamaes and the castles appertaining thereto having been taken by the O'Moores, were retained in their possession until this period. The ruins of Woodstock are seen on the right of the annexed view. Dorothea, dying without issue, is left out in many of the pedigrees of the Fitz-geralds' family, whilst others make her the ancestor of several branches of the Geraldines (l).

(f) Archdall's Monast. p. 309.
(g) Camden's Ann.
(h) Camden's Ann.
(i) Ibid.
(k) Archdall's Monast.

Athy, from the gradual contraction of the English pale, became a frontier and garrison town, commanding a pass over the river. Gerald, therefore, the 8th Earl of Kildare, for the purpose of securing the pale, erected several castles, and among others that of Athy, at the foot of the bridge about the year 1506, of which there only now remains a tower, seen in the view (m). In 1575 this castle was repaired and enlarged by one William White, from whence it obtained the name of White's castle, as appears by an inscription in the wall, and which was originally placed at the mill within the precincts. The remaining tower is at present used as a prison, being an appendage to the county jail of Naas. The said Earl of Kildare also, the more effectually to secure the borders, and to induce the gentlemen of the county to pay attention to them, procured in the reign of Henry 7th an act of parliament, appointing the assizes of the county of Kildare to be held at Naas and Athy, and that they should not be altered or removed from these towns, unless by a subsequent act of parliament (n).

Sir Robert Digby, who maried Lettice, daughter of Gerald, Lord Offaly, procured from James 1st, in the 13th year of his reign A.D. 1615, a charter constituting the market town of Athy a borough, sending two members to parliament, to be chosen by the burgesses, and governed by a recorder, sovereign, two bailiffs, and a town clerk, with power to hold a municipal or sovereign's court; with all other immunities of fairs, markets, and customs which it had enjoyed antecedent to the date of the said charter (o).

In 1642 the Earl of Ormond arrived in this town with 3,000 foot and 500 horse, and sent out parties to relieve the neighbouring garrisons of Carlow, Maryborough, Ballynakill, Berte, Cloghgrennan, and Ballylinan. In 1648 the Irish, under Owen Roe O'Neil, were in possession of it; but being hard pressed by Jones the parliament's general, Owen offered by his vicar general, O'Reilly, to surrender Athy, Maryborough, and Rheban, and lay down his arms, if he and his confederates had the privileges they enjoyed in king James's time. In 1650 the castle and town were taken by Cols. Hewson and Reynolds.

Athy, though a borough, is not an original parish, the present town being situated in two parishes, St. John's and St. Michael's; and the church living consists of an union of 5, that is St. John's, St. Michael's, Ardree, Kilberry, and Churchtown. During the close of the last and beginning of the present century, the great south road lay through this town, as it had done in very early periods; but afterwards, being turned through Castledermot, the business decreased and with it the population, for from 600 it has now only 550 houses, of which 160 are slated and built of lime and stone, and 390 cabins, thatched. Containing in the whole about 3,300 inhabitants. The public buildings are: the church erected about 1740, the county court some short time after, and the barracks about 25 or 30 years since. The bridge was built near the same time as the castle, and the ruins, besides those of the monasteries before spoken of, are those of St. Michael's church, built some time in the 14th century, and an old building among the trees seen on the left of the view, said to have been a nunnery, but of which no account can be obtained. The places of worship, besides the church, are a Roman catholic chapel, and a quaker's meeting-house. There is also a public school for the classics, with a subscription salary of £40 per ann., that is, £20 from the Duke of Leinster, who is patron of the borough and proprietor of the soil; £15 from the corporation, and £5 from the representatives of —— Weldon, Esq.

There are no manufactures of consequence established here, some stuffs, cloths, and hats are made, but not in sufficient quantity to merit the name of manufacture. Neither do they seem to increase, though a branch of the grand canal was brought in 1790 from Monasterevan to the west of the town. The exports from the neighbouring country to Dublin, in this canal, consist of coals, corn, flour, butter, and potatoes; to the amount of upwards of £20,000 per ann. (p).

HELL IN DUBLIN.

Christ Church Yard was formerly distinguished by the sobriquet of Hell, while an image of the Satanic president of that unpleasant locale, carved in oak, adorned the arched entrance. The fame of this region was not limited to Ireland, as it has been alluded to by Burns in the tale of "Death and Doctor Hornbook":—

> But this that I am gaun to tell,
> Which lately on a night befel,
> Is just as true as the deil's in hell,
> Or Dublin city.

In the journals of the day advertisements, such as "To be Let, Furnished Apartments in Hell," were of frequent occurrence.

Consecrated bells were formerly held in great reverence in Ireland, particularly before the tenth century. Cambrensis, in his Itinerary, says, "Both the laity and clergy in Ireland, Scotland, and Wales held in such reverence portable bells, and staves crooked at the top, and covered with gold, silver, and brass, and similar relics of the saints, that they were much more afraid of swearing falsely by them than by the Gospels; because, from some hidden and miraculous power with which they were gifted, and the vengeance of the saint to whom they were particularly pleasing, their despisers and transgressors are severely punished." Miraculous portable bells were very common; Giraldus speaks of the campana fugitiva of O'Toole, Chieftain of Wicklow; and Colgan relates that whenever St. Patrick's portable bell tolled, as a preservative against evil spirits and magicians, it was heard from Giant's Causeway to Cape Clear, and from the Hill of Howth to the Western shores of Connaught.

AN IRISH MUTINY IN BRAZIL.

A STRANGE STORY OF AN OLD-TIME EMIGRATION.

TOLD BY AN EMINENT TRINITY COLLEGE MAN.

Some eighty years ago there was published in London a book, entitled "Notices of Brazil in 1828 and 1829," by the Rev. Robert Walsh, LL.D., M.R.I.A., M.D., from which we take the excerpts given below. A few biographical details concerning the author will doubtless be of interest. Robert Walsh was born in Waterford, about the middle of the 18th century. Having passed through Trinity College (scholar, 1794; B.A., 1796), he took orders as curate to Dean Kirwan. He assisted the Rev. J. Whitelaw in the preparation of his "History of Dublin," and completed the work after Whitelaw's death. He was much interested in Irish antiquities. In 1820 he went out as chaplain to the British consulate at Constantinople, and wrote "A Journey from Constantinople to England," and other works connected with the East, besides "An Essay on Ancient Coins, Medals, and Gems, as Illustrating the Progress of Christianity in the Early Ages" (8vo, London, 1830), and "Notices of Brazil," 2 vols., 8vo. (The latter part of his life he was vicar of Finglas, near Dublin. He died about 1852. His son, John Edward Walsh, was Master of the Rolls in Ireland, 1866 to 1869. His younger brother Edward, a physician (born in Waterford in 1756; died in Dublin, 7th February, 1832), was the author of a "Narrative of the Expedition to Holland in 1779," and other works.

A few words by way of preliminary as to the origin of the book may not be out of place:—

Lord Strangford, whose embassy Dr. Walsh acompanied in the capacity of chaplain, was appointed in the summer of 1828 ambassador extraordinary to the Court of Brazil, for the purpose of completing, if possible, the marriage between Don Miguel and the young Queen of Portugal; as this was thought by the British Government the most likely means of bringing the difficult and long unsettled Portuguese question to a satisfactory termination. Although, however, Don Pedro, the Emperor, had been the original author of the project, he now evinced so much repugnance to its fulfilment, that it was necessarily abandoned, as a sort of family arrangement in which he was naturally the sole judge. During the voyage and residence of the embassy in Brazil, for the purpose above mentioned, the notices were written by Dr. Walsh for the amusement and information of his friends at home. In addition to a highly interesting personal narrative, they contain a full and satisfactory account both of the Portuguese Royal Family, and of Brazilian scenery, habits, and manners. From among the many interesting details, we select a few extracts, relating to our poor countrymen who embarked in the Brazilian service during the war between Buenos Ayres and Brazil; when, in order to withdraw as few persons as possible from the agriculture and manufactures of the country, it was resolved by the Brazilian Government to engage a number of foreigners as soldiers—first to do duty as military, and then to be located as agriculturists after a certain term of service.

The following is the strange and interesting story recounted by Dr. Walsh:—

"In October, 1826, Colonel Cotter, an Irish officer in the imperial service, entered into an engagement with the Brazilian Government to bring over a number of his countrymen. It does not appear what were the precise terms which he was authorised to offer to them; but, as far as I can collect from several I have conversed with, who remained behind in Brazil, and from other sources, they were as follow:—Every man was to receive pay and allowances equal to one shilling per day, one pound of beef, and one pound of bread as rations, and were to be employed four hours each day in learning military exercises, to be ready to act as soldiers if called on, but not to be sent out of the province of Rio unless in time of war or invasion; and at the end of five years of such engagement, to be discharged from all military service, and located as farmers on land, each having fifty acres assigned him.

"With these powers, Colonel Cotter proceeded to Cork, caused notices to be affixed to chapel doors, and instructed clergymen to give it out from the altars in different parts of the south of Ireland. The notifications were received with great joy by the people: the exceeding distress of the poor peasantry of that part of Ireland, as well from exuberant population as want of employment, is notorious, and they were eager to avail themselves of the proposal. Land was the great object of their competition at home, and they who thought themselves fortunate in obtaining a few acres at an exhorbitant rent in Ireland. were transported at the idea of receiving a grant of fifty acres, rent free, in Brazil. Many, therefore, as they told me, sold their farms at home, and laid out the small portion of money they could raise in purchasing agricultural implements, conceiving that their military service was to be merely local, and would no more prevent their attending to their land, than if they were members of yeomanry corps in their own country. Among them were mechanics, who looked forward to exercise their calling to advantage in Rio, and had brought out the implements of their trade; and among them certainly were many, whose idle habits led them to prefer a military life, and were ready to engage as soldiers, careless of the terms of their service. Of these descriptions, two thousand four hundred persons were collected, some of them, as was to be expected, of indifferent characters and dissolute manners; but the majority decent, respectable people, who brought out with them their wives and families, and who would be an acquisition to any country as settlers, but particularly to Brazil.

"Every thing was provided for their accommodation on leaving their own country; the ships were well found, stores and provisions of a good quality were not wanting, and the people thought themselves highly fortunate in this mode of emigration. They had been long expected in Brazil, and it was natural to suppose that everything would have been ready for their reception; but their arrival was the signal for annoying them, and that system of petty persecution commenced which roused them into mutiny, and finally effected the purposes for which it was resorted to, by driving them from the country.

"The Minister of War was at that time S. Barbozo, and from his subsequent hostility to the foreigners, it is to be presumed he was the instrument of their first annoyances, which were in his department. When the transports arrived nothing was ready for the accommodation of the men. They were kept for three or four days on board, and when at length they were landed, they were thrust into dirty empty barracks, without the smallest preparation of any kind for their comforts or wants. They had no beds to sleep on, not even a mat to keep them from the bare ground, which is always provided for Brazilian soldiers. This comfortless state was increased by want of provisions, for they were kept starving for two days without any distribution of rations, and when at length it was made, they were so bad in quality that the men could not eat them, but sold them for a trifle to the English to feed their horses; they were also deficient in quantity, and so irregularly given, that they were frequently afterwards forty-eight hours without receiving any issue. Many of them contracted fevers, and other sickness, from privation and anxiety, and in this state of debility were seen crawling about the streets of Rio. Application was made to the Brazilian Government to provide them with medicines and necessaries, but no notice was taken; and they would have perished on the roads, but for the humanity of Doctors Coates and Dixon, who supplied them with medicine from their own pockets. For some time they received no pay at all, and when at length it was ordered, it was much less than they were promised.

"In this state of disappointment and growing discontent, there was not the smallest pains taken to give them any habit or regularity. They remained in their quarters, idle and unemployed, dirty and neglected, and in the same clothes in which they had arrived, ragged and squalid, without the habits or appearance of common decency."

These and some other still more aggravated causes of irritation led to the well-known mutiny of the Irish and Germans, which for a short time seemed to threaten the overthrow of the regular Government. The subsequent fate of these wretched men is thus related:—

"Of 2,400 Irish who had been invited, and arrived in Brazil, not more than 200 were concerned in the insurrection; and these were generally young men, totally neglected, and left to themselves, to follow the impulse of any passion excited in them. They were without officers or arms, yet they caused much terror and anxiety, in a large and populous city, for three days. It was determined, therefore, to send them all back to their own country; and the object of those who laboured to bring that end about, was completely answered. They were immediately embarked, and placed on board the ships of war in the harbour, till transports could be provided for them. The Emperor himself seemed very well disposed towards them; and I am told by those who witnessed the fact, that he shed tears of anxiety and vexation when he heard the state into which they were degraded. It had been his custom frequently to attend Divine service, when it was performed for the Irish at the Praya Vermelha, where he freely knelt down amongst them. His condescension, however, was suspected. An absurd rumour had been circulated, that if this ceremony was performed three times, they were bound to him, as soldiers for unlimited service. On the third Sunday none but the officers attended—the men all disappeared—a strong proof of their repugnance to such an engagement, and their determination to resist it. He now gave every direction for their ample accommodation on their return home; and Mr. Gordon, the British Minister, and the English admiral, had power in his name to supply them with every necessary.

"On this occasion it was expedient to collect them all, and it was observed that many of them had been arrested and confined in various prisons. Mr. Aston, the Secretary of Legation to the British Mission, with that promptness and humanity which every one who knows

him will give him credit for, immediately applied to the proper authorities to have them found out; but so little interest did they take in the life or liberty of those foreigners, that they could give no information about them. At length he found thirty of them confined in the dungeon of the fortress of Villegagnon. On one occasion the whole of the officers had been arrested, and shut up in the cells of the prisons in the different islands. After eighteen or twenty days' incarceration, however, they were liberated, and never could learn why they had been confined; but numbers of inferior rank remained behind, till they were altogether forgotten. Such was the case of these poor men. When they emerged from these catacombs, they were in the most miserable state of destitution and disease, their bodies ulcerated with sores, and covered with vermin, and their skins so raw and tender from putrescency and mortification, that when it was necessary to clothe them for the sake of decency, to enable them again to appear, they could not bear the painful touch of any covering.

"They were a fine body of young men, and of good character. They had been called on to take the military oath, but they refused. They affirmed they had come out as settlers; if they were located as such, they had no objection to be enrolled as militia, learn military duty, and be ready to turn out to defend their own or any other part of the country invaded; but they persisted in refusing to take the oath tendered to them as mere soldiers, for unlimited service. For this offence they were represented as mutineers, and thrown at once into these dismal dungeons, where they had remained totally neglected, and must in a short time have perished in a state of putridity, had they not been relieved by the humane and timely interference of Mr. Aston. Two hundred and fifty were embarked in the Moro Castle, on the 3rd July, 1828, and sailed for Ireland. The Phœbe followed with 150 more, with the Highlander, and a Swedish ship, carrying in all 1,400 persons back to their native land. It was industriously given out that many of these persons had carried off plate and other valuables from the houses they had plundered, and a search was made among their boxes and trunks. Nothing was found to justify the suspicion, and then it was said that to avoid detection they had cast all these valuables into the sea.

"About four hundred were left behind engaged in different employments. A body of them, to the amount of 220 persons, forming 101 families, were conveyed to Bahia, and located at Taporoa, in the comarca of Ilheos, where they formed a colony, directed by a commissioner appointed to regulate their affairs. It was the only portion of the emigrants with whom good faith was observed; and it appears from the report of the Viscount Camamu, president of the assembly of the province, that they were deserving of every care and attention. Several who remained at Rio, I afterwards met and conversed with. They were doing well; and the whole, had they been properly encouraged, would have done the same. Some men from Waterford and Lismore were engaged in a quarry in the rear of our residence, preparing blocks of granite for building, and by their great industry and good conduct were earning five patacs (about seven shillings) a day, and making a comfortable independence. Another family, of the name of Cook, from the county of Tipperary, had been recommended to Messrs. Marsh and Watson, who located them on a farm in the Organ Mountains, where I visited them with Mr. Watson. The farm was in the depth of a forest, fourteen or fifteen miles within the recesses of the mountain. The way led through the wildest scenery; and on the bank of a river, in the centre of a forest, we found these colonists. They had built a large and comfortable house, with a rustic portico, and thatched it very neatly with palm branches, whose regular fronds formed a tasty roof, the stems and pinnate leaves of which were very elegantly disposed in the thatch. On the other side of the river, which we crossed by two trees forming a rustic bridge, was a large shed for cattle, and other conveniences; and rising up the hill was an extensive plantation of coffee, behind which, desecending into a glen, was a rich field of Indian corn in high health, with gourds, mandioca, and a variety of other produce of Brazilian agriculture. On our return the good woman had prepared for us a plentiful dish of bacon and eggs, with fried cakes of maize; and our entertainment concluded with whiskey, which our host had contrived to distil from his coffee plantation. When I contemplated this comfortable house and abundant farm, rescued from the heart of a Brazilian forest, cultivated by persons who in their own country could not make out a scanty livelihood in a miserable hovel, I could not help feeling the deepest regret, that 2,400 who had left their homes were not, as they might have been, so located. It would have abstracted so many individuals from an overflowing people perishing from want, and added a valuable population to a country, where millions of fertile acres are lying waste for lack of hands to cultivate them.

"The greatest part of the Irish who returned were in a disabled state. Hardship, wounds, privation and sickness had affected them more or less; but the ailment under which they principally laboured was lameness. Not furnished with shoes, nor able to provide them, their feet were attacked with the bichu, or insect of the country, which burrowed in myriads in their naked feet, and caused the most frightful ulcerations. Many of the men, therefore, are lame beggars about the streets, or incurables in the hospitals of Cork. Many who had less comfortable farms, are reduced to common labourers; and of all who returned home, there is not one, perhaps, who is not now enduring want and misery."

BLIND MAN'S BUFF.

This favourite sport of childhood is of French origin, and of very high antiquity, having been introduced into England in the train of the Norman conquerors. Its French name, "Colin Maillard," was that of a brave warrior, the memory of whose exploits still live in the chronicles of the middle ages. In the year 999 Liege reckoned among its valiant chiefs Jean Colin. He owed the name of Maillard to his chosen weapon, being a mallet, wherewith in fight he used literally to crush his opponents. In one of these feuds of such perpetual recurrence in those times, he encountered the Count de Louvain in a pitched battle, and in the first onset Colin Maillard lost both his eyes; he ordered his esquire to take him into the thickest of the fight, and, furiously brandishing his mallet, did such fearful execution that victory soon declared itself for him. When Robert of France heard of these feats of arms, he lavished favours and honours upon him, and so great was the fame of the exploit that it was commemorated in the pantomimic representations that formed part of the rude dramatic performances of the age; by degrees the children learned to act it for themselves, and it took the form of the familiar sport. The blindfolded pursuer, as, with bandaged eyes and extended hands, he gropes for a victim to pounce upon, seems in some degree to repeat the action of Colin Maillard, the tradition of which is also traceable in our name of blind man's buff. It would seem, then, that the game is nothing less than a myth in action, having for its nucleus the historic fact of this feat of arms.

BULLY'S ACRE.

The ancient burial ground adjoining the Royal Hospital, popularly known as "Bully's Acre," was once the principal place of sepulture of the Knights of St. John of Jerusalem, Kilmainham having been their chief seat in Ireland. Previous to the establishment of the Knights there, the burial ground was connected with a monastery, founded in the sixth or seven centuries by St. Maguen, from whom it derived its name.

OUR WEEKLY STORY

THE BROKEN DOCTOR.

It was race week at Newcastle. Drags, traps, carts, coaches-and-four and automobiles came streaming home down the great North Road. The side-paths were thronged with walkers. The rolling of wheels, clatter of horses, shouts of drivers, the laughter and talk, and the occasional blast of a horn made the sedate, walled in mansions reverberate. The scene was as gay as an English holiday crowd knows how to make it. Here and there, a few professionals, not having gone out for fun, were sobered by the memory of lost stakes; but most of the company had gone for fun and found it. They were tired, but hilarious. It had been Newcastle cup day—the day on which all the city-dwellers made it a point to go.

The sedate mansions are on one side of the great North Road; upon the other stretches the town moor, away, away, misty and green, to where the cows and sheep break the horizon. In race-week, the races are not the only event at Newcastle; there is a fair held upon the town moor—a sort of side-show to the races. Another stream of pedestrians sauntered in and out upon the moor.

"Newport shrimps, penny a bag," cried a little stout man from one of a row of booths by the side of the walk.

"Now for the weight you weigh; now for the weight you weigh; correct weight one penny!" sang forth a man who presided over an immense pair of brass balances on the other side of the path.

"Fresh, imported California apricots, here!"

"Your photograph taken by electricity while you wait!"

"This is the place to buy your canaries; a canary in a cage, half a crown!"

"Fresh monkey candy, pulled on the 'ook, on the 'ook, on the 'ook, pulled upon the 'ook!"

"Don't you want your fortune told? Don't you want your fortune told—by the Brazilian cockatoos?"

Old Aunt Sallies and cane ringers and shooting galleries and tented shows improvised a Midway such as bewildered the owner of many a pocketbook. Cheap Johns and fakirs to the right, left, and everywhere! The gasoline flambeaux would have made the long, north-country twilight superfluous. There had been races and athletic sports during the afternoon, but these were now ended, and there were only left the band and the people and a chance to promenade upon one of the finest commons in all England, which last was not unappreciated by certain stalwart young men and certain rosy-faced young women in white muslin.

They are a sturdy race, the north-country folk, with up and down ideas about things. A peddler had been selling something from the tailboard of a waggon. An old Tyneside miner insisted the peddler had given him wrong change. A dispute ensued and a crowd gathered.

"Aa gave thee a croon, an' thoo didst hand mae back three saxpences and a floorin," insisted the miner.

"They were four shillings," replied the pedler.

"Thoo leest," retorted the man.

"Goo for him, old maan," said the crowd; "hae's a Jew." In a twinkling the crowd had become a mob, some of whom, tugging at the shafts, turned the peddler's cart so quickly into a horseless carriage that the poor fellow could not keep his feet, and was like to be jolted out along with his bottles. A tall man stood upon a hummock and gazed after them. "They've got him oot noo," said he to his

wife. "Aa'm afraid they'll dook him i' the puddle."

"'Twill go hard wi' 'im," answered his wife, "all the moor thaat hae's a Jew."

But such a matter was only an accident in so large a show. Other talkers upon the tail-boards of other waggons made capital out of the dethronement of their late brother in trade, and the throng that might have stood about him, went to them, while off upon the course the band played a two-step, and the men and maids, young and younger, promenaded.

"Ladies and gentlemen, I have no claim whatever upon you, but if, for a brief moment, you will give me your attention, I may be able to tell you that which will be to your advantage and mine. It is said that the orator, Cicero, could adduce the witness of angels in support of a cause, could graft ears upon trees, and put hearts of flesh within ribs of stone. I can do none of these things. I can only appeal to your common sense, and, if the appeal fail, can retire with as much grace as I may." The speaker was a tall man in rather dingy light clothes. Despite the twilight it could be seen he had blue eyes and a drooping blond moustache, and that his not unhandsome features were given a grotesquely serious expression by a scar stretching from the left corner of his mouth across his chin. Other hawkers addressed their fractions of the throng from rostra more or less pretentious, but he stood upon a rough packing-case. Numbers of the strolling crowd drew up about him.

"Ladies and gentlemen," he resumed, with somewhat of an effort, though his thumbs were thrust gracefully in the pockets of his trousers—"ladies and gentlemen, I am a physician." The clear ringing voice of the man continued to swell the number of his auditors. Couples paused in their gossip, and with a "Let's see what this chap has to say," sauntered up to the circle. "I am not upon the medical register. Why, I will tell you later. I am a graduate of the Royal College of Surgeons, Edinburgh. Being a physician, it is my business to use the little skill I possess to help people to health. 'Oh!' you will say, 'he is a charlatan, an imposter. No real medical man would get on a box at a town fair and talk like that. He would be violating the etiquette of his profession.' Ladies and gentleman, I may be a charlatan, but hear me."

The upturned faces of the crowd were a study, as those of crowds are. Incredulity, curiosity, sympathy, cynicism, and blind gullibility were all there. "From Edinburgh I went to Crewe, and was assistant to the great specialist, Dr. Harrison. One day I filled out a prescription for the head nurse, and tucked my heart in with it to take away the taste. We were married. She became the mother of my boy, and then—I lost her. The Kaffir war broke out. I put my baby boy in the Blue Coat School and got a commission as surgeon, with twelve shillings a day. I served through both the Kaffir and Zulu wars. When the Prince Imperial died I was the officer in charge of his body, and brought it to the frontier. You notice the impediment in my speech. I broke my jaw trying to save a man's life. But I got a silver medal for it. I have had two Victoria Crosses also. Oh, I'm not brave. When you're in battle, you fight because you can't get away. I became so distinguished that one day they put me in charge of a transport expedition with five thousand pounds of Government stores. Among the stores were twelve quarts of gin. It took me just two days and two nights to drink it, and then I tried to make my report. The stores had flown. I was court-martialed and my name stricken off the register. Then I drifted. I had always been wild. I know what it is to stand in a coffee-house in London and warm myself with the sight of other men drinking, and then to go to a threepenny lodging house for—sleep." ("Poor fellow," murmured a woman to another. The medical man may have heard her.)

"Oh, don't pity me," he went on. "I have spent five hundred pounds in Paris in one week. Oh, I'm not good, either. Perhaps I could tell you things which would make you treat me in the way that some of you treated the peddler a few minutes ago." "Hae's a good talker, ennyhoo," remarked an old shepherd to a companion as he bent over to knock the ashes from his pipe.

"But ladies and gentleman, if you will tell me what is the matter with you and permit me to look you in the eye, I will tell you whether you are well or ill, and, if ill, may be able to prescribe for you. Such prescriptions will have little value as against those of a family physisian, made after long and sympathetic acquaintance with you, but, in default of those, will be harmless and may do you some slight service." All the time the medical man had been speaking, people had been gathering about him until there was now a throng. The long, north-country twilight still held. The medical man wiped his brow and paused for a long breath.

"Now, my friends," resumed the orator, "is there anything I can do for you? Pray do not hesitate because of the publicity of this matter. Publicity is necessary. But I trust we are not an uncompassionate assemblage." Then, raising his voice, "Is there anybody who wishes to be prescribed for by an old scamp of a doctor who is a disgrace to the profession?"

An old gentleman asked timidly for a cure for bronchitis.

"My dear sir," said the doctor, "if you will come this way, we may be able to find out whether you have bronchitis or not." The medical man and the old gentleman held a short colloquy.

"I fear, sir, that your affection is rather chronic than acute, but I cannot tell the exact character without a more thorough examination. If you will take this prescription to an apothecary, have it put up and use it according to directions, it should be of a good deal of help to you. Then, if you will call at my address, some time when I am sober, I may be able to do more for you. One shilling. Thank you, sir."

The medical man raised his voice in a half-conscious effort to be heard by those on the edge of the crowd. "There was a time, ladies and gentlemen, when my professional opinion was respected, but the old army surgeon has lost his grip. We're going to make a doctor of that boy of mine, though. I saw him the other day in his black gown, walking across the quadrangle with some other students. He has the fine brow and clear brown eyes of his mother. They say he is making a name for himself in the laboratory and the dissecting gallery. Sometimes he gets into the journals, too. See! All these clippings!" and the speaker drew a roll of newspaper scraps out of a tobacco-pouch which he kept in his waist-coat pocket. "Oh, we shall have him a great doctor yet. But he must not be hampered. He must not be hindered by having to account for his disreputable father. He thinks I was shot by the Zulus. . . . But we have not always been a hindrance to him. We have managed to scrape together a hundred and fifty pounds a year for him. He thinks it's an annuity, for it comes through a barrister at Gray's Inn. Oh, I won't tell his name, or where he is. Mine's changed. That's the joke. Ten years from now, if he lives, look for the first surgeon in England—that's my boy. . . . But, ladies and gentlemen, it is really a pity to inflict our own personal affairs upon you in this manner. I sincerely beg your pardon. But the public is our only confidant, and you, ladies and gentlemen, are the public. Since the public is so good to us, we must try to do something for the public. Ladies and gentlemen, who is next?"

There was a silence, broken finally by a tall byreman who called out from the edge of the crowd, "Whaat is the best coore for dyspepsie, doctor"

"Well, in general, sir, three days in prison with hard labour. It is better far than Beatem's pills. Do you smoke? Better stop smoking. I will write you a prescription in which the principal element is carbonate of magnesia. It may do you some good. Oh, a shilling, if you think it worth it. Thank you." Then, bending to a woman who with intense and sudden feminine resolution, had made her way to the fore: "Neuralgia of the face, madame? Neuralgia is, for the most part, the result of cold or exhaustion, which latter may be brought on in, at least, nine hundred and ninety-nine ways. Don't worry. Keep warm and dry, and get strong. I should say you might with advantage try a tonic of iron and port. You may as well take this prescription. You observe, ladies and gentlemen, that all these prescriptions are written in the plainest of English.

"My dear friends, I wish I could do more for you. The science of medicine is at best a poor thing, and I am only an outcast doctor. Yet I would deal with you honestly. We here may be exceptional, but I fancy it would not be difficult to humbug even ourselves. As individuals, we may be canny; but collectively, we are to be imposed upon by the first Janus-faced rascal that comes our way. . . . . There has ever been something touching to me in the credulity of the public. The public is a blind man groping in search of day—he trusts you because he is helpless. Why, I suppose I could sell you this dirt beneath my feet and not be half clever. I could cut a piece of tripe in strips, put the strips in a bottle, tell you they were tape-worms, and sell you a cure for them made of sawdust and loaf sugar. Or, if I took a bottle of petroleum, and shook up a little ammonia with it, some of you might be kind enough to credit my statement that it was a new kind of 'electric oil,' because you 'could feel the electricity.' But I won't do these things. I don't care to 'sell' you—I would rather heal you." There was a rather awkward pause, during which the medical man again rubbed his brow. A murmur of approval ran through the crowd.

"And what a world it is for woe and pain! My friends, we are born red: we die grey, and, what with ailings and heartburnings and personal cussedness, we appear to be wretched battledores of a most cruel fate. All a devil's dance. . . . But no, that is seeing with a jaundiced eye. I give you my word for it. On the whole, it is an interesting kind of a chaos, decidedly worth the price of admission. No, my friends, I am no cynic. I have had my fling and stand back to give my betters a show. Possibly in the next world the good God will grub stake me for a new start. Anyhow, I shall be sorry to leave this one—very sorry—v-e-r-y—s-o-r-r-y—and sorry to leave you, ladies and gentlemen." The medical man put his hand to his brow again, and seemed to have some difficulty in getting on. "A slight rush of blood to the head—a mild kind of vertigo. It is nothing. Pardon me. Ah, yes, what was I saying? Yes, as they sing in church, 'I think I see the angel faces smile' upon—upon the medical profession. . . . Ladies and gentlemen, one must not neglect one's opportunities. I feel regret at having been very careless in the matter. . . . Who was it that gave us the lines,

"'God out of knowledge and good out of infinite pain,
And sight out of blindness and purity out of stain'?

"Those are very good lines. He expresses it perfectly. . . . The art of living consists in becoming a prince of circumstance. . . . I very much fear I have been its creature. . . . And—and it is as good as—finding an antitoxin for consumption—it is, indeed—. . . . It looked for a moment as though the way were not clear, but it is! I assure it is! And do not for a moment think that—that there are no openings in the new Jerusalem for—for the practice of the medical profession. It would seem—it would seem——"

There was a surging forward of the crowd. The medical man was off his box.

"Baack wi' ye, everybuddy. The maar's fainted," shouted one of the onlookers. The gaping crowd fell back.

"Hae needs a doctor himsel, noo. Iss hae breathin'?"

"The medical man opened his eyes. "His—name—is—George—Mattheson," said he.

"Whose name, sir?" asked one, bending over him.

"George's," was the answer, with an effort. A slight shiver convulsed the body. The head sank negligent, and the eyes closed as the eyes of one who, after a weary journey, yields to sweetest sleep.

The music of the band floated across the moor, and the shouts of the cheap Johns mingled with it. If the medical man, there upon his back, could have opened his eyes again, he would have seen the first dim stars of evening, and the harvest moon, red in the west.

MONEYGRANGE CASTLE, QUEEN'S COUNTY.

To the Editor of "The Dublin Penny Journal."

Sir.—About three miles from the town of Carlow, on the banks of the river Barrow, and in the Queen's County, formerly stood the ancient Castle of Monksgrange, or Kilmaglock.

In the "History of the Queen's County," by Daniel O'Byrne, we find it stated that "Grange Castle, like that of Shrule, is of many years standing; and is said to have been built by a wife of one of the Harpoles, who so much abhorred the cruel acts of her husband that she erected this castle and resided in it in order that she would not have any familiar communication with him. Tradition asserts the cause of her fixed abhorrence towards him was that he, in one of his devilish rages, hung an interesting child, a niece of hers."

It is very doubtful if this statement is at all true, as it is more likely this castle, like Rheban and Woodstock, was erected to defend one of the many fords of the Barrow river.

John Pagett, whose Leighlin Diocesan will is dated June 14th, 1701, and proved in 1706, and his wife, Julian Dunn (a daughter probably of the Dunns of Brittas Castle, Chiefs of Hy Regan), held the "castle, buildings, and lands of Grange." They left a daughter, Elizabeth Pagett, married in 1704 to William Harborne, and a son, William Pagett, who married in 1705 Catherine Crathorne—likely a daughter of either Ralph or Geffery Crathorne, of Dublin or Baltinglass.

This William, dying before the year 1754, leaving "an only son and heir," John Pagett, living in 1754, and still owner seemingly of some property in Carlow and Queen's County, which he either leased in that year to or from John and James Hamilton, of Carlow and Dublin.

The remains of the old walls of Grange Castle have some years ago been incorporated and surrounded by a modern mansion erected by the late Mr. Rowan M'Combe, and, like most old castles in Ireland, was supposed to have been haunted. John Pagett certainly removed from the place, and dying some time after in his house in Carlow, gives directions in his will "to be buried there."

Does Coote, in his "Survey of the Queen's County," make any reference to this castle and its occupants, or can any reader of your paper, who is interested in our old castles in Ireland, say if there is any illustration or drawing of this building in its original state, or can give any further particulars regarding this family of Pagett and their connection with the locality of Grange?—Yours faithfully,

WM. JACKSON PIGOTT.

Manor House, Dundrum, Co. Down.

ULSTER IN AMERICA.

EARLY IRISH EMIGRANTS.

In two volumes collectively comprising some twelve hundred pages, Mr. Charles A. Hanna has compiled, and G. P. Putnam and Sons have published, the most comprehensive work on "The Scotch-Irish" that has ever seen the light. The first volume is devoted to a history of a Scot in his original seat; that is to say, in north-eastern Ireland, whence he migrated to south-western Scotland, from which second home he returned in the seventeenth century to his primitive habitation. The second volume, with which we are here especially concerned, is allotted to the Scotch-Irish in America, and presents the first close approach to an exhaustive account of the transatlantic migration of the descendants of those Scotch Presbyterians who had settled in Ulster, and who in the eighteenth century found it impossible to endure any longer the persecution to which they were subjected at the hands of the Anglican Church in Ireland. We purpose, with Mr. Hanna's help, to indicate the proportion of this Scotch-Irish emigration, and the American localities which principally profited by it, and also to show by the testimony given by Joseph Galloway before a Committee of the House of Commons in 1779 the importance of the part taken by the Scotch-Irish in the American War for Independence.

Froude and Lecky have both directed attention to the volume of the Scotch-Irish emigration from Ulster to the American colonies during the first eighty years of the eighteenth century. The movement may be said to have been immediately after the annihilation of the woollen manufacture by the legislation of 1690. According to Hely Hutchinson, within two years after the Irish were prohibited to export their woollen manufactures to any country whatever, from 20,000 to 30,000 workers in wool had to be supported by charity. Twenty thousand Presbyterians left Ulster for the American seaboard. Many more were driven by the first passage of the Test Act, by which the taking of the Sacrament according to the rites of the Established Church was made a condition of holding any office, civil or military, under the Crown, above the rank of a constable. The Presbyterians, the Independents, the Huguenot immigrants, and the Quakers were by this Act swept under the same political disabilities, and were cut off from the army, the militia, the Civil Service, the Commission of the Peace, and from seats in the Municipal Corporation. For a time after the accession of George I. the outflow of Presbyterian emigrants from Ulster to the American colonies slackened in the hope that the Test Act would be altered. When the prospect of any substantial alteration therein was shut off men of spirit and energy refused to remain in a country where they were held unfit to receive the rights of citizens. Thenceforward, until in 1782 a large measure of self-government was conceded to Ireland, shiploads of families were annually poured forth from Belfast and Londonderry. A special stimulus has been thought to have been imparted to the movement in 1772, when many of Lord Donegal's Antrim leases, having fallen in simultaneously, he demanded a hundred thousand pounds in fines for the renewal of them. The tenants, all Protestants, offered the interest of the money in addition to the rent. The offer was refused. Land speculators paid the fines and took the farms over the heads of the tenants in order to sublet them. Another great Antrim proprietor imitated Lord Donegal's example, and forthwith a whole countryside was depopulated. The least needy of the expelled tenantry gathered their effects together and sailed to join their countrymen in the New World. In the two years following the Antrim evictions 30,000 Presbyterians left Ulster for a land where there was no legal robbery, and where those who sowed the seed could reap the harvest. The resentment which they carried with them continued to burn in their new homes, and in the American War of Independence England had no fiercer enemies than the grandsons and the great-grandsons of the Presbyterians who had held Ulster against Tyrconnell.

With the aid of contemporary, or nearly contemporary, authorities, Lecky endeavours to form an estimate of the numbers of the Scotch-Irish who emigrated to America during the eighteenth century. After pointing out that the famine of 1740 and 1741 gave an immense impulse to the movement, Lecky notes that for several years thereafter the Protestant emigrants from Ulster were computed at about 12,000 annually. More than thirty years later Arthur Young found the stream still flowing, and he mentioned that 4,000 emigrants had sailed in 1773 from Belfast alone. Lecky quotes with approval the conclusion reached by Newenham, who in his book on "Irish Population," collected much information: "If we said that during fifty years of the eighteenth century the average annual emigrations to America and the West Indies amounted to about 4,000, and that, consequently, in that space of time about 200,000 had emigrated to the British plantations, I am disposed to think that we should rather fall short of the truth than exceed it."

We pass to the testimony given before a Committee of the House of Commons in March, 1779, by Joseph Galloway. This testimony, first printed in London in the year named, and republished in Philadelphia in 1855, will be found literally reproduced in the book before us. It is well known that Joseph Galloway was a Tory, or, as he would have preferred to be called, a Loyalist. He was a native born American, and, at the time when he gave his testimony, was a little more than forty-eight years old. He had lived, as he told the Committee, in the province of Maryland, in the Dalaware counties, and in the province of Pennsylvania, chiefly in Philadelphia. A lawyer by profession, he had practised in all the Courts of Pennsylvania, in those of the Dalaware counties, and in the Supreme Court of New Jersey. He had been a member of the Assembly of Philadelphia for eighteen years, and Speaker of the House for twelve. He had been appointed by the Pennsylvania Assembly to attend the Continental Congress which met in September, 1774. During the French and Indian War he had been appointed by the same Assembly one of the Commissioners for disposing of the money granted to the Crown, and he had been several times a Commissioner to treat with the Indians. When Sir William Howe took possession of Philadelphia, Joseph Galloway at his request undertook the office of Superintendent of the Police of the city and its suburbs. In this capacity, as we shall see, he was able to obtain information touching the nativity and nationality of the rebel soldiers.

This witness, Joseph Galloway, having been

called before a committee of the House of Commons, was examined by Lord George Germaine. After some preliminary inquiries the following question was put to him: "At the beginning of the present rebellion, when the inhabitants first took up arms, had the people in general independence in view?" Mr. Galloway replied: "I do not believe, from the best knowledge I have of the state of America at that time, that one-fifth of the people had independence in view. I wish when I give an opinion, always to give my reasons for it. The progress of the spirit of independence was very gradual. So early as the year 1754 there were men in America, I may say in the towns of Boston, New York, Philadelphia, and Williamsburg, who held independence in prospect, and who were determined to seize any opportunity that offered to promote it, by procuring additional persons to their number. These men, when the Stamp Act was passed, made a stalking horse, or screen, of the gentlemen of the law in every part of America, to cover their designs, and to sound the trumpet of opposition against Government; but avowed that their conduct was on the ground of obtaining a redress of American grievances, and not with a design to separate the two countries. Upon this ground, I am confident, the gentlemen of the law acted. When the Tea Act was passed, they made the same use of the merchants who were smugglers in America as they had done of the lawyers before, still declaring, that they mean not independence. So late as the sitting of the Congress in 1774 the same men, when charged with it in Congress, and while they held it tenaciously and religiously in their hearts, almost to a degree of profanity denied it with their tongues—and all this was done on their knowledge, that the great bulk of the people of North America was averse to independence. If we look at the resolves of Congress, down almost to the very period of their Declaration of Independence, they gave out that it was not with a view to the total separation of the two countries, but from necessity; because unless they declared independence, the Powers of Europe would not trade with them, and they were in great distress for want of a great many foreign necessaries. So that, from all these circumstances, I am convinced that not one-fifth part of the people had independence in view."

Now let us mark the grounds on which Mr. Galloway must be deemed an especially competent witness as to the nationality of the rebel soldiers. This question was put to him: "Were deserters from the rebel army frequent while Sir William Howe was in Philadelphia?" The witness replied: "They were frequent—almost daily. I have known forty-nine come in in a day, many days from ten to fifteen." Mr. Galloway was next asked: "What number do you suppose came in to the army at Philadelphia?" He answered: "The deserters were generally sent from headquarters down to me for examination; from me they went to Mr. Story, the officer appointed to administer the oath of allegiance. He kept a regular account of their numbers, their names, and the places of their nativity, and I think there were upwards of 2,300 qualified at his office, and I believe on good reason, there might have been upward of 700 or 800 more not qualified; for I often found, on seeing him in the evening, that the number I had sent down to him had gone, so that I suppose, at least, 3,000 came in." Then came the interesting inquiry: "That part of the rebel army that enlisted in the service of the Congress (i.e., the Continental Army) were they chiefly composed of natives of America, or were the greater part of them English, Scotch and Irish?" Mr. Galloway answered: "The names and places of their nativity being taken down, I can answer the question with precision. There were scarcely one-fourth natives of America; about one-half Irish, the other fourth were English and Scotch." To a subsequent question touching the number of Washington's army at Valley Forge during the winter of 1777-78, the reply was: "In the latter end of February or beginning of March, 1778, Washington had not 4,000 effective men, from a great variety of accounts, from a number of people who lived by his camp, and from officers of his own army." The witness explained that it was through sickness and desertion that the number of the rebel soldiers had been thus greatly diminished after the battle of Germantown.

(To be concluded next week.)

THE DANES IN IRELAND.

On his first entrance into Ireland a Scandinavian traveller will be immediately reminded of the ancient dominion of his countrymen. It cannot possibly escape his observation what a striking part the Norwegians, or, as they are there exclusively called, the "Danes," play in their popular legends and traditions of Ireland. That, like the north-western districts of Scotland, it should have best preserved the popular life of ancient times with its songs and legends must, it is true, be ascribed to its remote situation. Everywhere, even far in the interior of the country, we are shown Danish raths (mounds and entrenchments), and among others the so-called "Danish cast," a long ditch and rampart in Ulster. "Danish cooking-places" are also pointed out, consisting of small circular spaces set round with stones, and bearing traces of embers and burnings, some of which are met with scattered about on heaths and moors. In the ancient copper-mines, in the south of Ireland, roundish stones with a dent round the middle are now and then dug up, which, it is evident, were used in former times in working the mines. These stones are called by the common people "Danes' hammers." In like manner they generally call most of the antiquities that are dug up, whether weapons or ornaments, "Danish." Tales calculated to awaken horror of outrages of the Danes are connected with all these pretended Danish memorials; and the further we travel into the remote western districts the more terrible are the tales we hear of the distress and cruel oppressions which the inhabitants endured under their Danish conquerors. Nevertheless, the Irishman has preserved, as well as the Englishman, the remembrance of the Danes' contempt of death and irresistible bravery. "That might even frighten a Dane," says the Irishman, at times, when speaking of some desperate undertaking. A kind of superstitious fear of the redoubted Danes seems in some places to have seized the common people; at least, it is an acknowledged fact, that in several parts of the country they continue to frighten children with the "Danes." Similar ideas about the Danes are to be met with even among the more enlightened portion of the people. Not long ago it was a firm belief among many educated men in Ireland, that there were families in Denmark, who could not forget the dominion they had formerly exercised in Ireland, and who bore a title derived from the large estates which their forefathers had once conquered and possessed there. It was likewise commonly supposed that the Danes had carried with them from Ireland a great number of manuscripts, which were said to be preserved in one of the large collections of books in Copenhagen; as if, forsooth, it had been one of the chief aims of the bold and dangerous expeditions of the ancient Norwegians, at that remote period, to carry off scientific treasures, and, above all, manuscripts written in Irish, and consequently, in a language that was for the most part entirely incomprehensible to them. In the last century in particular, and at the beginning of the present one, the Irish literati attributed to the Danes, or rather to the Norwegians, much to which, strictly speaking, they could have no valid claim.

Some of the meteorites that fall upon the earth possess a peculiar structure, indicating that they have more than once been in a molten condition. Doctor Berwerth, of Vienna, concludes, as the result of his studies of this class of meteorites, that they came originally from a volcano situated in some distant part of space, but that before reaching the earth they were subjected to great heat, which metamorphosed their structure. To explain this he suggests that in the course of their celestial journey they may have passed through the atmosphere of a sun, or may have been fused through the sudden birth of a new and neighbouring star. The heat developed during their fall through our atmosphere is not sufficient to explain the changes that they have undergone.

THE INFLUENCE OF MUSIC

By M. J. B.

III.

By Music . . . . . .
Intestine war no more our passions wage,
And giddy factions hear away their rage.
. . . . . .
Music the fiercest grief can charm,
And fate's severest rage disarm;
Music can soften pain to ease,
And make despair and madness cease;
Our joys below, it can improve,
And ante-date the bliss above.
—Pope—"Ode, St. Cecilia's Day."

It is related of Alexander the Great that, on hearing soft music, he ordered the harp strings to be broken fearing the enervating effects of such melody on his hardy warriors (1). No doubt this astute pupil of Aristotle's had learned and remembered how in this very way Cyrus had reduced the Lydians to servitude. Herodotus tells us (Clio., 155) that Cyrus having consulted Croesus as to how he should deal with this rebellious people, was advised to instruct the children in dancing, music, and other effeminate accomplishments, and that they would soon lose the dignity of manhood. The advice was accepted and proved sound. The manners of the Lydians became totally changed (Id., 157). For, says the famous Giraldus Cambrensis, music may be used to heighten the pleasures of the vicious, as well as to animate the virtuous and the brave (2). Montesquien observes that the ancient Greek philosophers, however much they differed from one another on other subjects, yet all agreed on the importance of the cultivation of music, and he suggests the explanation is that music was necessary as a counterpoise to the gymnasium and military training which must otherwise have developed a fierce hardihood and spirit of cruelty ("Esprit des Lois," iv., 8).

Music, therefore, is no mean index of character:—

The man that hath no music in himself,
Nor is not mov'd with concord of sweet sounds,
Is fit for treasons, stratagems, and spoils;
The motions of his spirit are as dull as night,
And his affections dark as Erebus;
Let no such man be trusted.
—Shakespeare: "Merchant of Venice," v. 1.

Aristotle, whose giant intellect eludes the grasp of all mankind beside, even as their pigmy understandings fail to compass space infinite; devotes almost the entire of his treatise on education to music (Politics, Book v.). This most subtle of subtle philosophers explains that moral education ought to precede the intellectual; music promotes moral improvement, refines the sentiments, and exalts the character; and, therefore, it is obviously a first essential in education. So utterly have we degenerate Intermediate-bred men become, that we confound in our every-day conversation, education, and instruction, and see no inaccuracy in speaking of "technical education." The pagan philosophers' loftier conception of the human soul would surely enoble us up-to-date Christians could we grasp them!

Music formed an essential part in the education of the Greeks (3). "Plato," says Montesquin (iv., 8), "is not afraid to affirm that there is no possibility of making a change in music without altering the frame of government. Aristotle, who seems to have written his 'Politics' only in order to contradict Plato, agrees with him notwithstanding, in regard to the power and influence of music over the manners of the people. This was also the opinion of Theophrastus, of Plutarch, and of all the ancients;

an opinion grounded on mature reflection, being one of the principles of their polity."

Nor were our Milesian ancestors wanting in discrimination on this head. MacGeoghegan tells us that "among the Milesians music formed part of a good education; everyone was desirous of knowing how to sing or play on some instrument" (Hist. of Ireland,63). The early Cambro-Norman invaders were delighted with the "commendable industry" with which the Irish applied themselves to music, as we read in Cambrensis (Top. Dist., iii., xi.); and even in those dark days, when the schoolmaster carried his life in his hands, the missionary did not neglect the study and teaching of music (4.). So Henry Beauclerc, when civilising the English, did not fail to have them taught music (Ling. Hist. Eng., ii., 1); and I have already noted Charlemagne's attention to the same subject (Algog. ii., 290). When a few years since Mr. Gill, Secretary to the Agricultural Board, was prosecuting enquiries into the happiness and prosperity of the Danish farmers, he was informed by "every leading agriculturalist whom he met in Denmark, without exception," that they rested on the education of the peasantry and small farms. This education, he ascertained, consisted in history, literature, language, and the songs and proverbs of the people (Recess. Report, 145-6).

If the great truth, that man's soul is nobler than his body, and consequently his moral training more important than any "technical instruction" in arts or crafts, were once firmly grasped, we could then recognise that, to seek first the kingdom of God and His glory, is after all not a foolish waste of time, even for the much belauded hard-headed practical man. But, alas! it has been well observed. "If we were called upon to name the one great fact of modern times, the truth most interesting to all classes, we should mention 'available funds,' as decidedly and without a rival, holding the first place in the human mind.—Hogg's "Weekly Instructor," Edin., ii., 342

SONNET—ADARE.

As o'er the antique bridge pensive I lean,
How calmly bright,—how venerably grand,
Through clustering trees, you towers and steeples stand;
Reporting well, what splendour once hath been,
Proud denizen of each time-hallowed scene!
Aye, power and priestcraft here held high command,
Stern dwellers of the heart! beneath whose brand
Even instinct dies—the very soul grows mean!
And yet, tho' ruin's gradual decay
Steals, with the ivy, round each turret gray,
And breathes its spirit thro' the cloistered gloom;
A charm unwonted in their earlier day,
Dwells with their green old age, and still shall bloom
Undimmed, while we sleep well in our forefathers' tomb.

General Lew Wallace, the author of "Ben Hur; a Tale of the Christ," was United States Minister at Constantinople some years ago. His novel has recently been dramatised.

THE BATTLE OF RATHMINES.

Described by Mr. Elrington Ball.

On Tuesday, March 25th, Mr. Elrington Ball read a paper before the Society of Antiquaries on "The Battle of Rathmines." After relating the historical events which led to the engagement, he described the appearance of the Marquis of Ormonde with a large force in June, 1649, before Dublin, which was then held for the Parliament by Colonel Michael Jones. The latter had made an effort to obstruct the march of the Royalist Army from Kilkenny, but had been outmanœuvred by Ormonde, and had been forced to retire again into the city. Ormonde's first encampment was at Castleknock, from which he seized the Viceregal residence in the Phœnix Park, which then stood on the site of the Magazine, but he moved his army on the next day to Finglas, in order to prevent any communication between Jones and the garrisons of Drogheda and Dundalk, which were then held by the Parliament. There he remained for more than a month. Mr. Ball strongly criticised the policy of inactivity which Ormonde adopted, and expressed the opinion that, if he had attacked Dublin at once, he would have easily defeated the Parliament forces. The Dublin garrison was in a state of the most dire necessity, and provisions were selling at famine prices, while the town was in a defenceless state owing to the want of fortifications. Ormonde's delay gave Jones opportunity to obtain provisions by sea, which Ormonde took no steps to prevent, and also enabled him to enclose the town with earth works. As soon as Drogheda and Dundalk had fallen to Lord Inchiquin, Ormonde was joined by that nobleman, and he began then to attack the portion of the city which lay on the northern side of the Liffey. In the course of these operations he saw the importance of more closely investing the city, and with this object, at the end of July, moved the principal portion of his army to the southern side. At the very moment when he made this move, Jones was joined by large reinforcements of seasoned troops which had been sent from England by sea. Jones had only a small town to guard. Dublin on the southern side of the river was represented by an area which a line starting from Guinness's Brewery, taking in the Coombe, St. Patrick's Cathedral, Grafton street, and Trinity College, and ending in Townshend street, would enclose, and outside this lay on all sides grass and tillage lands. The only roads were the one through Crumlin, which led to Tallaght; the one through Harold's Cross, which led to Rathfarnham; the one through Rathmines, which led to Milltown and Dundrum; the one through Donnybrook, and the one to Blackrock. On the Blackroad road the only dwellings of any importance were Lord Fitzwilliam's castle at Merrion and his castle at Baggotrath; on the Rathmines road was a castle near Palmerston Park, which had been built by Sir George Radcliffe; and a castle at Milltown, which belonged to Archdeacon Bulkeley (both of which had been burned at the time of the Rebellion). On the Harold's Cross road were the castle of Rathgar, which belonged to the Cusacks; and the castle of Rathfarnham, which belonged to the Loftus family; and on the Crumlin road was the castle of Drimnagh, which also belonged to the Loftus family. On the lands of Rathmines Ormonde encamped his troops on ground long known as the Bloody Fields, but now covered by the Palmerston district. He proceeded at once to stop the ancient water course which ran into the city from the Dodder at Templeogue, and a few days later took the Castle of Rathfarnham, which was garrisoned by the Parliament. It was then determined to fortify the Castle of Baggotrath in order to deprive Jones of pasture for his horses, and to command the approach to Dublin from the sea. On the evening of August 1st, Ormonde despatched a strong force for the purpose of carrying out the necessary works, but they were led astray in the dark, and only reached Baggotrath an hour before dawn. Jones, who saw the importance of preventing Ormonde's design, drew out a strong force and prepared to attack. Ormonde thought, however, that he could not do so for some time, and telling his troops to stand to their arms, retired to take some rest. While in his tent he was aroused by sound of firing, and on rushing out found his troops beaten out of Baggotrath by Jones's men and retiring on the main body of his army. A panic seized Ormonde's troops, and, in spite of his utmost efforts to rally them, they were completely routed, the result of the engagement being a complete victory for the Parliament. Mr. Ball referred to a number of curious tracts giving an account of the battle, and mentioned instances of the extraordinary perversion of the truth indulged in by both sides to encourage their supporters. In one of these tracts it was stated that Ormonde had again enclosed the city after the battle with 40,000 men, and in another the engagement was described as a night surprise.

As the result of studies on New Jersey mosquitoes last summer, Professor John B. Smith, of Rutgers College, says that not only will the insects travel long distances from their breeding-place, but on favourable evenings large swarms rise and are carried during the night by winds. The direction in which they go is often seaward. Swarms have been met fifteen miles from shore, and they are common five miles from shore. Migration of mosquitoes with the aid of the winds Professor Smith regards as of much importance, and as rendering the control of the mosquito nuisance a State rather than a local affair. The Anopheles mosquitos continue to breed long after frost has set in, and even a covering of ice on ponds is not fatal to their larvæ.

ENTRY OF GEORGE IV. INTO DUBLIN—1825.

(From a Contemporary Engraving. For Key, see page 43.)

THE HISTORY AND ANTIQUITIES OF THE CITY OF DUBLIN.

FROM THE EARLIEST ACCOUNTS:

Compiled from Authentick Memoirs, Offices of Record, Manufcript Collections, and other Unexceptionable Vouchers,

By THE LATE WALTER HARRIS, ESQ. WITH AN APPENDIX.

SECT. II.

To consider this building as a royal seat of government, it is to be noted, that it was not converted to that use till the reign of queen Elizabeth. Before that period there does not appear to have been any fixed place for the reception of the chief governors, who sometimes held their courts at Thomas-court (in which was a chamber of presence, called the king's chamber, wherein the lords of the council assembled), sometimes at the palace of the archbishops of Dublin, at St. Sepulchre's, but oftener in the castle of Kilmainham. In 1488 the earl of Kildare, then lord deputy, received sir Richard Edgecomb in the king's great chamber in Thomas-court, and there did homage, and took the oath of allegiance to King Henry VII. in the person of Sir Richard Edgecomb. The earl of Kildare, being appointed lord deputy in 1524, took the oath of office in Christ-church, and from thence went in state to the abbey of St. Thomas, Conn O'Neil carrying the sword before him, where he entertained the nobility and the king's commissioners with a splendid feast. In 1556 the lord lieutenant, Fitz-Walter, kept his court in Kilmainham, and there received the submission of Shane O'Neil. The lord deputy, Sussex, kept his court in the same place the year following. In 1559, the earl of Sussex, being again appointed lord lieutenant, lay the first night of his arrival at the house of Mr. Peter Forth; because the house of Kilmainham had been damaged by a tempest the year before, and was not yet repaired. The next morning he rode to St. Patrick's-church, and took the oath of office, and from thence to St. Sepulchre's, where he kept his court.

Upon this occasion it was judged that

the castle of Dublin might be fitted up at less expense for the reception of the government, than the house of Kilmainham; and accordingly queen Elizabeth, in the third year of her reign (1560), sent a mandate to the lord lieutenant and council, "to repair and enlarge the castle of Dublin, for the reception of the chief governors." What was done in pursuance of this order does not particularly appear; but it is manifest, from an entry in the rolls of chancery, "That when sir Henry Sydney, lord deputy, landed in 1565, he lay at Monck-town, and from thence removed to the house of Thomas Fitz-Williams at Merrion, from whence as he approached the city, the sheriffs of Dublin met him with sixty horse and a trumpeter, and at Hoggin-green* the mayor and aldermen received him in their formalities. He marched not through the city, but rode through the ford of St. Mary's abbey, and passed along Oxmantown-green to Kilmainham, to view the house, which was then in decay; and there the sheriffs at the outer gate took their leaves of him, and went home at two o'clock, and his lordship went to St. Sepulchre's, and there lodged, and on the 20th of January he was sworn in Christchurch." Hooker (a) adds, "that after he was sworn, the new appointed privy council conducted him to the castle of Dublin, where he swore them according to the queen's instructions." From that time the castle became the residence of the chief governor, and has continued so from thence to this day.

Hooker (b) affirms, "that it was Sir Henry Sidney who repaired and beautified the castle about the year 1567, and that before his time it was ruinous, foul, filthy, and greatly decayed." But it was probable something was done to make it commodious, by virtue of the queen's mandate in 1560; otherwise it could be no way fit for the reception of Sir Henry Sidney seven years after. What that good lord deputy did upon this occasion, will best appear from a concordatum for the establishment of the housekeeper of the castle, issued by his lordship and the privy council on the 15th of November, 1570, which we will give entire, not only as it illustrates the subject, but as it may afford some entertainment to the reader, to compare the English language at that time with the modern way of writing.

By the Lord Deputy and Counsaill

Henry Sidney,

"WHERAS ther haith ben erected of late within hir majestie's castell of Dublyn, certen lodging and outher fair and necessarie roulmes, boeth for a convenient plaice for the lord deputie's howse, and a fit seate for the placing and receiving of any gouvernour heraftir, as for the bettir and more commodious resorte and assembly of the counsaill, and for the gretter ease of all sutors boeth riche and poore, whiche hertofore were accustomed to travaill to and from plaices boeth farder distant and lesse commodious for the dispatche of ther causes; which lodgings and buildings yf they shoulde not from time to time be well mayntained, looked into, ayred, clened, and dressed up in the absence of the gouvernour, they shoulde in short tyme come to grette decay and ruyne. We have therfor thought fytt that as well for the keaping of the said howse, and roulmes newely erected, as for the clensing of all the gutters within the said castell, sweping and keaping clene of the walkes upon the walls and platform, as for the tending and keaping of the clocke within the said castell, whiche requireth daily attendance to be tempred and kept in frame, to appoint sume honest, carefull, and diligent person to take that chardge in hand who should from tyme to tyme undertake the doinges of thos services, and in the gouvernour's absence to loke to the preservation of thinges appertayning to the howse, to take the same by indentur, and in like mannir to re-deliver theme, so that hir majestie shall not, through negligent keaping of the said howse, be at any chardge. Forasmuche therfor as ther is no certain fee or interteynment appointed for that purpose, we have condescended and agreed to allow unto ur well biloved George Arglass of Dublin, gentilman, servant unto us the said lord deputy, or to his sufficiente deputy, sixteen pence currant moncy of Ireland by the day, and withall, sume convenient roulme for his lodging within the sayd castell, at the assignment of the gouvernour for the tyme being; whiche allowance of sixteen pence currant money of Ireland, we have agreed shall begyn from the first daye of October last past, and to be payed quarterly out of th' office of the hanaper in this realme, of souche sums of money as shall be thear receyved to hir majestie's use from tyme to tyme, and the sayd intertaynment shall so endure and continue during pleasur; willing and requiring the clearke of hir majestie's sayd hanaper in this realme for the time being, and his deputies and substitutes by virtue of this our concordatum, to be enrolled in hir majestie's exchequer in this realme, to make payment thereof unto hym from tyme to tyme as appertayneth, without any further special warrant or bill to be obteyned for the same; and this accordingly shall not only be hys sufficient warrant and dischardge in that behalfe from tyme to tyme, but also unto the thesorer, vice-thesorer, chauncellour, and barrons, and outher officers of hir majestie's said exchequer, auditors, and outher hir majestie's officers and commissioners of accomptes, to make allowance thereof from tyme to tyme upon the accomptes of the clearke of hir majestie's sayd hanaper for the tyme being. Given undyr hir majestie's signett at the castell of Dublin the 15th of Nov. 1570, in the 12 yere of hir majestie's reign."

SECT. III.

To consider the castle under its third relation, namely, as a place where the courts of law and equity for the despatch of the justice of the nation, and where the high courts of parliament were held, it may be observed, that in the early ages of the English government the courts of justice were ambulatory, and not fixed to any certain place. In the reign of Edward III the common-pleas and exchequer were held at Carlow. In the 37th year of that reign (1363) the common-pleas was by writ removed from Carlow back to Dublin; and the reason for doing so is given in the record, namely, "because Carlow was surrounded by enemies, the walls about it much decayed, and the place reckoned unsafe for the residence of the king's ministers." This would have been as good a reason for removing the exchequer from thence at the same time; yet it continued there long after. In the first year of Richard II. (1377) the ministers of the exchequer petitioned the parliament for an augmentation of their salaries, in regard, "that being obliged to sit at Carlow from their proper habitations, they could not have their own provisions for their sustenance, and by their fees of office, by which they used to be supported while the exchequer was at Dublin, they could not live on their ancient fees." Upon the reasons alleged in this petition, their salaries were augmented, and an order issued for continuing such additional salaries while the exchequer sat at Carlow. After that time the common-pleas was removed back to Carlow, and that court was held there in 1389; from whence both that court and the exchequer were probably removed to Dublin in the reign of king Henry IV., for by patent dated the 27th of June, 1401, the duke of Lancaster, then lord lieutenant, had power given him to remove them to such places as he should think proper.

Parliaments also were unfixed, and held at various places, as at Trim, Drogheda, Naas, Weys or Wexford, Conall, Clare, Limerick, Baldoyle, Castledermot, Kilkenny, Waterford, Cashel, but more frequently at Dublin, and sometimes in the castle itself, as was done 11th Jac. 1. 10th and 15th Car. I. These assemblies were also sometimes held in Christ-church, where was a room called the common-house (perhaps the house of commons), as appears by a statute 29 Hen. VI., where a petition from the seneschal of the liberty of Wexford, and from the sovereign of Wexford, was read in parliament, directed to the earl of Kildare, lord deputy, to the lords spiritual and temporal in parliament assembled, and to the commons of the said parliament in the common-house within the Cathedral of the Holy Trinity, as Christchurch was anciently called; in which place a parliament was held in the government of Thomas, earl of Sussex in 1559, and at many other times. The stately halls of religious houses afforded also a commodious reception for those assemblies, and there is an instance of one being held in the hall of the Carmelites in Whitefriar's-street in the year 1333.

KEY TO ENTRY OF GEORGE IV. INTO DUBLIN.

1 The Rotunda. 2. Lady Mountjoy, Mrs Stewart, Hon Mrs Knox, Mrs Arthur Dawson and party. 3. Residence of Sir Kingston James, Bart, Lord Mayor Elect. 4. Temporary Barrier. Irish Motto (English), "A Hundred Thousand Welcomes." 5. Countess of Caledon, Lady Blayney, Lady Elizabeth Alexander, Lady Strange, and party. 6. Countess of Farnham, Countess Belmore, Lady Aylmer, Lady Baird, and party. 7. Prince and Princess Esterhazy, Marchioness of Conyngham, and party. 8. Duchess of Leinster, Marchioness of Downshire, Countess of Antrim, Lady Ennismore, Prince Larderia, Vicomte Chabot, and party. 9. The 3rd Light Dragoons, followed by Country Gentlemen and Citizens, on horseback and on foot, in regular procession, with flags, etc, etc. 10. Colonel Lindsey, 78th Highlanders. 11. Lord Aylmer, Adjutant-General. 12. Lieutenant-General Lord Beresford, G. C. B. 13. Sir George Quentin, K. C. H., Aide-de-Camp to his Majesty. 14. Sir D. Baird, G. C. B., etc, etc., Commander of the Forces. 15. Lieutenant-General Lord Blayney. 16. Lieutenant-General Sir E T Hammond, K. C. H., and Chief Equerry and Clerk Marshal. 17. General Lord Howden, G. C. B. 18. Major-General Sir Colquhoun Grant, K. C. B., Commanding Leinster District. 19. Major-General Sir John Elley, K. C. B., Commanding Connaught District. 20. Lord Burgherst, Aide-de-Camp to his Majesty. 21. Lieutenant-General Sir Robert Bolton, K.C.H., King's Equerry. 22. Major-General Bayly, King's Equerry. 23. His Majesty. 24. Marquis of Winchester, Groom of the Stole. 25. Marquis of Headfort, Lord in Waiting. 26. The 78th Highlanders. 27. Sir Benjamin Bloomfield, Private Secretary to his Majesty. 28. Ulster King of Arms, Sir W. Betham. 29. Lord Mayor's State Coach in Waiting 30. Lieutenant-Colonel Lord Arthur Hill, Aide-de-Camp to the Lord Lieutenant. 31. Earl Talbot, Lord Lieutenant of Ireland, preceded by the principal Officers, Lords Spiritual and Temporal, Baronets, Law Officers, Members of the University, Clergy, etc, etc, in their several equipages 32. City Sword-Bearer, Sir James Riddal. 33. City Mace-Bearer, Richard Quinton, Esq. 34 First Water Bailiff, Mr Francis Thorne. 35. City Marshal (with the keys), J Stanley, Esq. 36. Second Water Bailiff, Mr. A. Mitchell. 37. City High Constable, Mr. J. Dooley. 38. First City Member, Sir Robert Shaw, Bart. 39. First City Sheriff, Sir George Whitford. 40 Lord Mayor of Dublin, Sir A. B. King, Bart. 41. City Chaplain, Rev George Blacker. 42. Recorder (with Address), Sir Jonas Greene. 43. Second City Member, Thomas Ellis, Esq. 44. City Sheriff, Sir Nicholas Bradey. 45. Aldermen who had served as Lord Mayor. 46. Aldermen who had not served. 47. Sheriffs, Peers, etc, etc. 48. His Majesty's Footmen. 49. Royal Battle-axe Guards. 50. City ditto.

In the latter end of the reign of queen Elizabeth, and the beginning of that of king James I, both terms and parliaments were held within the castle. In Michaelmas term 1605, and in the two following terms, the courts of justice sat in a house seated near the river Liffey, and not far from the college, which was built by Sir George Cary for an hospital, though never applied to that use. In 1606 application was made by the lord deputy Chichester, and the privy-council of Ireland, to the lords of the council of England for a fund to build a place to hold terms and parliaments in. A part of the letter sent upon that occasion may be necessary to be transcribed, as it manifests what is alleged. "We are enforced to acquaint your lordships how much we are troubled for a place to hold the terms in; for that Sir George Cary, the treasurer here, hath written to me the deputy, that he hath set his house here, which he built for an hospital, to Sir Thomas Ridgeway, who (as he saith) shall succeed him in his said office of treasurership, in which place, since Michaelmas last, the terms have been kept, as this likewise must be by reason of the shortness of the time to adjourn it. We find that Sir George Cary is not unwilling it should be retained for that use, so he might be compounded with for the charge he hath been at in building of it, which he values to above 4,000l. and that charge we think very inconvenient his majesty should be at; for that we have found a place near the magazine, where the victuals were, which for 1,600l. of sterling harps, we will undertake to make a great deal more convenient for keeping of the terms, and besides fit to hold the parliament in, when his majesty shall be pleased to appoint the same, for which purpose only his majesty must be at a great part of the aforesaid charge, tho' the terms should be still kept in the hospital; by reason that the places here, wherein the parliaments have been used to be kept, were reduced by the blast of gunpowder, and still remain so. In consideration whereof, we are humbly bold to beseech your lordships to be a mean to his majesty to allow the aforesaid sum of 1,600l. to be employed in building that place, which will be both fit for terms and parliament. For to bring the courts of law again into this castle, were to draw them just over the store of munitions, which not only by practice (as formerly hath been attempted) but by using of fire, by burning of some prisoners in the hand, may be fired, to the exceeding detriment of this state, and ruin of this castle. In which respects we doubt not but your lordships will think it exceeding inconvenient, and for our parts, we know it to be so dangerous (and at no time more than now) as we cannot without almost inevitable hazard adventure upon it; whereof her late majesty and your lordships had a like feeling, and accordingly directions were sent hither for removing the terms out of this castle, which, upon some occasion of altering the then deputy, was neglected: and, if we may by this bearer herein receive his majesty's directions and money, we are in good hope that by Michaelmas-term the place before mentioned may be built for the terms, which are now greater than usually they have been; and therefore neither the hospital nor castle great enough for that purpose, but only for necessity." From Dublin, 29th April, 1606. Your lordships, &c.

What is intended by the blast of gunpowder mentioned in this letter, refers to an accident by the blowing up of gunpowder on the Wood-quay in 1596, which did great damage to many parts of the city.

Notwithstanding the importunity of the said letter, yet the castle continued to be the ordinary place of meeting both for terms and parliament till the rebellion of 1641, and from thence to the restoration.* For the building mentioned to be erected for an hospital by Sir George Cary, afterwards became the property of the Chichester family, and was called Chichester-house, and was rented and inhabited by the lord justice Borlase in 1641. But in latter times, parliaments have been constantly held in it, and on the site thereof a sumptuous parliament-house hath been not many years since erected, with all

*It is a stately pile, fronted with a grand arcade of Ionic columns, the whole built of Portland stone.

convenient chambers and offices for the despatch of the business of those august assemblies. A particular place was afterwards set apart in Christ-church-lane for the business of the law, and handsome courts and chambers erected for that purpose in the year 1695.

And now the castle is disengaged from both these encumbrances, which were a great inconvenience to the state, and such great alterations have been made in the building within side the walls, that it would be difficult to point out what the ancient buildings were, or to what uses applied. The two gate-towers were anciently set apart for the constable's lodgings, and the custody of state prisoners; and so late as the year 1715, one of them, together with the adjoining old buildings, was applied to the latter of those uses. The ancient fee of the constable was £20 sterl. per annum, which afterwards was augmented to £365 per annum, to make the whole 20s. a day; and a few years ago the constable had an additional allowance made him of £70 per annum in lieu of his lodgings, to continue until the said lodgings were put in proper order for his habitation. Each warder, called "vigil" in the public records, had a yearly fee anciently of 45s. 6½d. as appears by a liberate now remaining in Birmingham-tower, of the 32nd year of Edward III. (1358) whereby Thomas Langarton, vigil or warder of the castle of Dublin, had an order for receiving out of the exchequer 11s. 4½d. for a quarter's salary, from the 17th of August to the 17th of November, in part payment of his annual fee of 45s. 6½d. and another of the same import for his quarter's salary from November the same year to the February following. The porter's ancient fee was £13 13s. 9d. a year, and so continues. The fee of the keeper of the council-chamber is £18 5s. a year. It has been seen before, that upon the first creation of a housekeeper, the fee was 16d. a day, or £24 6s. 8d. a year. At present the fee of the housekeeper of the castle, and of the house of (a) Chapelizod, and overseer of the gardens, and keeper of the wardrobe (which are blended in one office), amounts to £120 per annum. The ancient fee of the keeper of the records of Birmingham-tower was £10, but it is now augmented to £500 per annum, as has been already remarked.

This description of the castle shall be closed by the relation of a matter not wholly foreign to the subject, namely, an account of a controversy determined by combat within the walls of it in the year 1583, as the same is related in the chronicle of John Hooker, alias Vowell, a contemporary writer.

Connor MacCormack O'Connor appealed Teig Mc. Gilpatrick O'Connor before the lords justices (Adam Loftus, archbishop of Dublin, and Sir Henry Wallop) and council, for killing his men under protection. Teig, the defendant, pleaded that the appellant's men had, since they had taken protection, confederated with the rebel Cahir O'Connor, and therefore were also rebels, and that he was ready to maintain his plea by combat. The challenge being accepted by the appellant, all things were prepared to try the issue, and time and place appointed, according to precedents drawn from the laws of England in such cases. The weapons, being sword and target, were chosen by the defendant, and the next day appointed for the combat. The lords justices, the judges, and councillors attended in places set apart for them, every man according to his rank, and most of the military officers for the greater solemnity of the trial were present. The combatants were seated on two stools, one at each end of the inner court of the castle. The court being called, the appellant was led forward from his stool within the lists, stripped to his shirt, and searched by the secretary of state, having no arms but his sword and target; and taking a corporal oath, that his quarrel was just, he made his reverence to the lords justices and the court, and then was conducted back to his stool. The same ceremony was observed as to the defendant. Then the pleadings were openly read, and the appellant was demanded whether he would aver his appeal? Which he answered in the affirmative. The defendant was also asked whether he would confess the action, or abide the trial of the same. He also answered that he would aver his plea by the sword. The signal being given by the sound of trumpet, they began the combat with great resolution. The appellant received two wounds in his leg, and one in his eye, and thereupon attempted to close the defendant, who being too strong for him, he pummelled him, till he loosened his murrion, and then with his own sword cut off his head, and on the point thereof presented it to the lords justices, and so his acquittal was recorded. Hooker gives the victory to the appellant, and yet acquits the defendant, which is a contradiction occasioned by his not attending to the legal terms; and he concludes with an ill-natured remark, "that the combat was managed with such valour and resolution on both sides, that the spectators wished, that it had rather fallen on the whole sept of the O'Connors, than on those two gentlemen."

(To be Continued.)

(a) Lately converted to a barrack for the regiment of artillery.

METEMPSYCHOSIS OF THE ROSE

Beside a dying rose there grew
A daisy white that gently watched,
As one by one its petals fell,
And touched the tired flower with dew.
All night the daisy fanned the rose,
But when the sun, with calid breath,
Did kiss the colour from its bloom
The rose grew faint in fragrant death.

Then while I watched the last leaf lorn
To snowy whiteness change and fall,
I saw the rose-soul gently pass
Into a daisy bud new-born;
And lo! the breaking light of day
The new-born flower in pink revealed,
The self-same hue the rose had worn
Before its doom the sunkiss sealed.

A BATTLE OF STARLINGS.

In "Memorabilia of the Seventeenth Century" we read that in October, 1621, a most remarkable battle of starlings was fought over the city of Cork, frightening the citizens out of their wits, and inspiring the whole country with terror and wonder as to what it might portend. The author sets out in his preface by stating to the "gentle reader" that "to report strange or admirable accidents is subject both to danger and disgrace—to danger in that they may be held as prodigious or ominous; to disgrace in that they may be reputed fabulous. I need not fear disgrace in reporting so strange an accident to be reputed fabulous, being able to free myself from any suspicion of such an imputation by certificate and letters from right honourable persons in Ireland, where the accident fell out, to right honourable persons at court, and divers in London at this present; as also by the testimony of right honourable and worshipful persons, and others of good reputation now in London, who were eye witnesses, beholding the same during the time it continued.

"To come to the fight of these birds. They mustered together at this above-named city of Cork some four or five days before they fought, every day more and more increasing their armies with greater supplies. Some came from the east, others from the west, and so accordingly they placed themselves—as it were, encamped themselves—eastward nd westward about the city. The citizens, more curiously observing, noted that from those on the east and from those on the west some twenty or thirty in a company would pass from the one side to the other, as it should seem employed in embassages, for they would fly and hover in the air over the adverse party with strange tunes and noise, and return back gain to that side from which, as it seemed, they were sent.

"And, further, it was observed that during the time they assembled the stares of the East sought their meat eastward, as the stares of the West did the like westward, no one flying in the circuits of the other. These courses and customs continued with them until the 12th of October, which day being Saturday, about nine of the clock in the morning, being a very fair and sunshine day, upon a strange sound and noise made as well on one side as on the other, they forthwith at one instant took wing, and so mounting up into the skies encountered one another with such a terrible shock that the sound amazed the whole city and all the beholders. Upon this sudden and fierce encounter there fell down into the city and into the river multitudes of stares, some with wings broken, some with legs and necks broken, some with eyes picked out, some their bills thrust into the breasts and sides of their adversaries in so strange a manner that it were incredible, except it were confirmed by letters of credit and by eye-witnesses with that assurance which is without exception. Upon the first encounter they withdrew themselves backward east and west, and with like eagerness and fury encountered several times, upon all which these stares fell down in like strange and admirable manner as upon the first encounter. They continued this most admirable and violent battle till a little before night, at which time they seemed to vanish, so that all Sunday, the 13th of October, none appeared about the city.

"Upon Monday, the 14th October, they made their return again, and at the same time, the day being as fair a sunshine day as it was the Saturday before, they mounted into the air and encountered each other with like violent assaults as formerly they had done, and fell into the city upon the houses, and into the river, wounded and slaughtered in like manner as is before reported; but at this last battle there was a kite, a raven, and a crow, all three found dead in the streets, rent, torn, and mangled."

Dr A. A. Julien recently brought before the New York Academy of Sciences evidence to show that the ravages wrought upon sea bluffs during great storms are often due to the wind as much as to the ocean waves. Sand and salt spray driven for hours before a violent wind act like a gigantic sand-blast, eating away, with surprising rapidity, the layers of gravel and sand of which many projecting headlands are composed. The surfaces of bodies exposed to such a wind are soon pitted. In a great gale in 1899 a single night sufficed to convert the window-panes of the life-saving stations at Truro into ground glass.

Ancient Boroughs of Ireland

(From Lewis's "Topographical Dictionary of Ireland, 1837.)

Seal.

ATHENRY, an incorporated market and post-town, and a parish, partly in the baronies of Clare, Dunkellin, Kilconnell, and Tyaquin, but chiefly in the barony of Athenry, county of Galway, and province of Connaught, 11 miles (E.) from Galway, and 95½ (W. by S.) from Dublin: containing 12,185 inhabitants, of which number 1,519 are in the town, which is wholly within the barony of Athenry. This place, anciently called Athnere, is said to have derived its name from "Ath-na-Riagh," "the King's ford," or "the abode of a King." Sir James Ware considers it to have been the chief town of the "Anteri," who, according to Ptolemy, were the ancient inhabitants of this part of the country. It was the first town established by the De Burgos and Berminghams, the Anglo-Norman invaders of Connaught, and at a remote period was surrounded with walls and became a place of importance. In the reign of John, Meyler de Bermingham granted a site of land here for the foundation of a Dominican monastery, and contributed towards the erection of the buildings, which were completed in 1261. Florence O'Flin, Archbishop of Tuam, and the Earls of Ulster and many others were munificent benefactors to this establishment, which became very extensive and wealthy, and the chief burial-place of the earls of Ulster and all the principal families of this part of Ireland. Indulgences for the benefit of the monastery were granted by the Pope in 1400, and in 1423 its church was burned down; in 1427, some of the monks obtained licence from the Pope to found two subordinate establishments; and in 1445, Pope Eugene IV. renewed the bull of Pope Martin for repairing the church, at which time there were 30 brethren in the monastery. A Franciscan friary was founded here by Thomas, Earl of Kildare, in 1464, and chapels were successfully erected by his wife, the Earl of Desmond, and O'Tully. In 1577 the two sons of the Earl of Clanricarde, called the "Mac-an-Earlas," renouncing the submission which they had recently made to Queen Elizabeth, assembled their partisans in considerable force and sacked the town, destroyed the few houses that had recently been built, set fire to the new gates, and drove away the workmen employed in repairing the fortifications and in erecting other buildings, which had been undertaken by the chief governor, Sir Henry Sidney. From this period the town remained in a deserted condition till 1584, when Robert Foyle, John Browne, and other of its former inhabitants petitioned the queen's council in England for such encouragement as would enable them to bring over English artisans and tradesmen to settle in the town, to rebuild and improve it, and to support a sufficient force for its future protection. The queen, in 1585, directed the lord-deputy to grant their request forthwith; and although no record exists of any such grant having passed the seal, several buildings were erected and numerous improvements were made. In 1596 the northern Irish invested the town, burned the gates, and forced an entrance; but they were repulsed in an attack on the castle, which was bravely defended, and having failed in an attempt to scale the battlements, they took possession of all the wall towers, and made prisoners of the inhabitants who guarded them; they afterwards set fire to the town, which, with the exception only of the castle, the abbey, and the church, was again reduced to ashes, and from this time seems to have been entirely neglected except by its immediate proprietors. In 1644 the Dominican establishment was revived and converted into a university; and in 1662 a writ of privy seal was issued on behalf of the inhabitants; but the town, which formerly held the second rank in the county, never recovered its ancient importance.

The borough is very ancient, and probably exists by prescription. From a murage grant made to the "bailiffs and honest men of Athenry," in the 4th of Edw. II. (1310), it would appear that a corporation previously existed; and writs of the first and some subsequent years of the reign of Rich. II. shew that it then returned representatives to parliament. Queen Elizabeth, by letters patent dated at Greenwich in the 16th year of her reign, granted to the portreeve and burgesses divers extensive privileges, and in the same year gave them the site and precincts of the Dominican monastery. In 1578 she conferred upon them various rectories and tithes; but all these privileges and possessions appear to have become forfeited during the civil dissensions which soon afterwards ensued, as Chas. II., by his letters under the privy seal in 1662, after reciting the petition of "the ancient inhabitants, natives and freemen of the old corporation of Athenry," and other particulars referring to the borough, ordered that they should be forthwith reinvested with the said town and corporation, with all their rights, interests, and estates, and all privileges and immunities, excepting such inhabitants as had been disloyal and disobedient to his government. A charter was granted in the 4th of James II., on a seizure of the franchises, but it does not appear to have been accepted or acted upon. The grant of Elizabeth is that under which the borough is governed: the corporation is styled "the Portreeve, Burgesses, and Freemen of the Corporation of the Town and Liberties of Athenry," and consists of a portreeve and an unlimited number of burgesses and freemen: the above grant empowers them to appoint a common clerk and "all such other necessary servants as Trim used," but the only inferior officers are a serjeant-at-mace, craner, pound-keeper, two appraisers, and a bellman, who are appointed by the portreeve. The portreeve is annually elected on the 14th of Sept. by the portreeve and burgesses, from three burgesses nominated on the preceding day by the same body, and is sworn in on the 29th; the burgesses are nominated on one day, elected on the next, and sworn on the 29th of Sept., and are now about twenty in number. The borough returned two members to the Irish parliament till the Union.

THE RED HAND OF ULSTER.

BY MINNA IRVING.

With plume and lance and pennon gay
And all his fearless band,
The wild and warlike Hugh O'Neill
Set sail for Erin's Land.
He looked across the frothing waves
And a mighty oath he swore,
That he would be the first to touch
That green and lovely shore.

For other chieftains bold as he
In ships as swift and strong,
Kept even with his plunging bow,
Or followed all day long;
And when at night the fog came down
He heard upon the deep,
Their songs of dear ones left behind
To wait, and watch, and weep.

The way was long, the sea was rough,
The wind blew cold and loud,
And many a man went overboard
With white foam for a shroud.
Shorthanded, soon the gallant ship
Began to drop astern,
And Hugh O'Neill to fret and feel
His oath within him burn.

Up rolled the curtain of the dawn,
And lo! before them lay,
Folded in flowers, the longed-for land,
A cable's length away.
Hugh cast his glittering sword aside,
And toiled among his men,
The beads of sweat stood on his brow,
His strength was that of ten.

"Look! yonder lies the pebbly strand;
Straight on, my sturdy crew,
And everyone shall drink to-day
His fill of mountain dew.
O, for the brawny arms we left
Beneath the salt blue sea!
Pull, or the banshee weird shall wail
This very hour for me."

But faster through the boiling surf
On swept the other boat,
And Hugh O'Neill stood up to see,
With curses in his throat.
He seized his sword, cut off his hand,
And held it dripping red,
Then flung it on the silver beach
That curved so close ahead.

Thus thus the Earl of Ulster kept
His oath of dreadful fame,
And thus the daring Hugh O'Neill
Into his scutcheon came.
Red symbol of a dauntless soul,
The arms of Ulster show
The imprint of the severed Hand
That bled so long ago.

LITERARY NOTES.

It is said that Mr. Maurice Hewitt's new romance will treat of Mary Queen of Scots.

✧ ✧ ✧

Messrs. Hutchinson will publish very shortly an authorised biography of the late Marquis of Dufferin and Ava. The work was begun before the Marquis's death, and the author, Mr. C. Black, had the advantage of preparing much of it under his supervision.

✧ ✧ ✧

The last issue of the Journal of the Cork Historical and Archæological Society is a very attractive publication. The contents include the following:—"Barrymore"; "Selections from a MS. on the Defence of Ireland, 1780"; "The Goldsmiths' Company of Dublin," etc., etc.

✧ ✧ ✧

A book of recollections of Dublin Castle and of Dublin society will shortly be published by Messrs. Chatto. It will appear anonymously, and the identity of the author is likely to excite some speculation. He knows "The Kestle," as he calls it, and he has a fund of good-natured stories to tell about it and the society of which it is the centre.

✧ ✧ ✧

The sale of the Great White Horse Hotel at Ipswich, where the immortal Pickwick found so much difficulty in threading the maze of corridors to his bedroom, has revived interest in the question where Dickens derived the name of his great creation. He appears to have gone to parish registers, for in the register of Bath Abbey appears the name of Moses Pickwick, and one Ann Pickwick was married there on 20th October, 1783.

✧ ✧ ✧

Very Rev. Canon O'Hanlon, P.P., Irishtown, has just finished a literary enterprise upon which he has been for some time engaged —namely, a history of the Queen's County. The want for such a work has long been complained off, and we do not doubt that the author will shortly receive the names of a sufficient number of subscribers to enable him to send his manuscript to the printer. At least one thousand subscriptions of £1 each are necessary.

✧ ✧ ✧

"Rolf Boldrewood," author of "Robbery under Arms," "A Colonial Reformer," etc., who is in his 76th year, has just resigned the presidency of the Australian Literature Society on the advice of his doctor. In early life a squatter, worth a quarter of a million, he was ruined by a succession of disastrous droughts, and entered the Government service as a stipendiary magistrate and goldfields' warden. In his later years he has made a distinct mark as a novelist of Colonial life.

✧ ✧ ✧

Recently there has been a large number of books dealing with the tragedy and comedy of the London poor. In America the historical novel holds the field. Messrs. Houghton, Mifflen, and Co. announce that they are issuing 125,000 copies as the first edition of "Audrey," a new historical romance by Miss Mary Johnstone, the author of "To Have and to Hold." Probably 100,000 is the largest first edition of a novel ever issued in England, but America does everything on a large scale. Mr. Gilbert Parker's "Right of Way" still holds its place as the best selling novel in New York.

✧ ✧ ✧

The first call for the twelfth International Congress of Orientalists has been issued by the committee, the convention to be held in Hamburg beginning on the 4th and ending on the 10th of September of the present year. The work will be distributed among nine sections, viz.—(1) Linguistics and General Indo-European Department; (2) India and Iranía; (3) Farther India and Oceanica; (4) Central and Eastern Asia; (5) General Semitic Department; (6) Islamic Peoples; (7) Egyptian and African Languages; (8) Intercourse between the Orient and the Occident, in both ancient and modern times; (9) Colonies in the Orient.

✧ ✧ ✧

Mr. Justin M'Carthy's recent suggestive article on "The Coming Novelist" recalls the fact that there are fashions in novels, just as there are in most other things. A few years ago the problem novel held the field. Most of the problem novels were written by ladies, perhaps the best remembered being Mme. Sarah Grand's "Heavenly Twins," Mrs. Henry Norman's "Gallia," George Egerton's "Keynotes," Iota's "Yellow Aster," and Miss Emma Brooke's "The Superfluous Woman." The fame of Robert Louis Stevenson brought the adventure story into fashion, and many writers found fame and fortune by adopting a policy that may be described in the phrase "back to Scott."

✧ ✧ ✧

A year or two ago Messrs. Putnam had in mind an interesting project for the publication of a series of volumes on early American families, Scoto-Irish, Dutch, and others. Mr. C. A. Hanna, who has paid much attention to the subject, believes that nearly a fourth of the total white population of the American Colonies at the outbreak of the Revolution were Ulster folk. Another inquirer in the same field is Mrs. Margherita A. Hamm, whose book on "Famous New York Families" will be issued by the publishers already named. The author has collected biographical details about thirty of these families. Her volume, based largely on MSS. records never before published, will be profusely illustrated with reproductions from photographs and family portraits.

✧ ✧ ✧

Our readers will be interested to learn that Mr. M. J. Byrne, Kilrush, is engaged in translating into English Philip O'Sullivan Bear's compendium of the History of Ireland, his idea being to publish the work if a sufficient number of subscribers are forthcoming. "Should I get a sufficient number of subscribers," writes Mr. Byrne, "I propose to publish a translation of that part of the history which comprises the entire reign of Elizabeth. The volume would contain about 230 or 250 pages of the size and type of Father Denis Murphy's work, 'Our Martyrs,' with which it is proposed to make the translation uniform. I am not desirous of making any money for myself out of a work done in leisure hours for pure recreation, and I propose to offer it to subscribers at a price merely sufficient to pay the expense of publication. The price, therefore, will depend very much on the number of subscribers, but I shall not go to press at all unless I can bring out the volume at a price not exceeding five shillings." We have no doubt that a very large number of students of Irish history and antiquities will be forthcoming to co-operate with Mr. Byrne in his useful and interesting project.

✧ ✧ ✧

Fortunate is the man who discovers a unique copy of a work by a writer such as Charles Lamb. There was a striking case in point the other day at Sotheby's. "The King and Queen of Hearts, with the Rogueries of the Knave who stole the Queen's pies," is, as the title implies, a trifle for children. The 15 engravings, attributed by some to Mulready, and the text, occupy 16 leaves, printed on one side only, 5¼ inches by 4 inches and these are protected by the original yellow paper wrappers. At the dispersal of the late Mr. Andrew Tuer's library in July, 1900, this booklet formed part of a lot which fetched 15s. Later, by means of a letter from Lamb to Wordsworth, it was identified as an early effort by the Christ's Hospital essayist. The book bears date 1805, and was originally priced at "1s. plain, and 1s 6d coloured"; the present example is uncoloured. The first offer was of about £20, and, with American agents as underbidders, it passed into Messrs. Sabin's hands at £222. This, of course, is the highest sum ever paid for a booklet by Lamb, comparing with "Beauty and the Beast," £43; and "Prince Dorus," £42, both of these, too, being illustrated booklets, bearing the imprint of Godwin. A somewhat defective First Folio Shakespeare, 12⅜ inches by 8 inches, fetched £620, and a beautiful Saec. XV. Horae, decorated by a Flemish artist, £288.

✧ ✧ ✧

The Societe des Bibliophiles Francais, founded in 1820, is about to publish an account of "quite a family" of manuscripts of St. Augustine's "City of God," illuminated by artists of the middle and end of the fifteenth century. This important work, which will make its appearance towards the close of the present year, will be illustrated by numerous reproductions from the manuscripts in question, which are found some in the National Library in Paris, some in the libraries of La Haye, Nantes, Macon, etc. The Society's home is at Paris, No. 31 Rue Candon.

✧ ✧ ✧

The Italian Ministry announces that the commission appointed by the Government for the purpose of publishing the Pandects of Justinian will, in the near future, issue a photographic reproduction of the famous Codex Pisanus-Florentinus, under the auspices of the directors of the Laurentian Library. The codex covers 1,844 pages, which the introduction will swell to some 2,000 pages. The work is to be completed within three years, a fascicule of 200 plates appearing every three months. The work is being done by the firm of Danesi in Rome. Of the hundred numbered copies, only seventy are to be open to the book trade. The subscription price is 800 lire.

✧ ✧ ✧

The libraries of Rome have recently been increased by an interesting collection secured through the exertions of that champion globe-trotter, Giovanni Vigna del Ferro, who, in 1898, accompanied the Italian expedition to China in the official capacity of an interpreter, and, at the conflagration of the imperial palace in Pekin, managed to save a large part of the library. A catalogue is in preparation.

✧ ✧ ✧

We make a few extracts from Mr. Stopford Brooke's Introduction to Miss Emily Lawless's new volume of poems, "With the Wild Geese":—

Some months ago, being in Surrey, I saw, by accident, the privately printed poems which now appear for the first time before the public. Miss Lawless's Irish stories, "Hurrish, a Study," and "Grania," had some years before seemed to me to draw nearer to the soul of the West of Ireland than any other books of the kind; and the historical and imaginative study, "With Essex in Ireland," was also full of that strange inner life which, below outward appearance, ebbs and flows in the Irish people. . . .

I read these lyrics of the wild Atlantic lands in the least wild of all the shires of England, and, in my sympathy with them, urged Miss Lawless to publish them. . . .

The "Wild Geese" was the name given by the romantic and sorrowful imagination of the Irish to the exiles who, like the wild birds and with their wailing cry, migrated to the Continent before and after the Battle of Aughrim and the Surrender of Limerick in 1691.....

No words that I have read have realised with more insight and sympathy the temper of these daring, high-bred, honourable, reckless and sorrowful men than those with which Miss Lawless has clothed the bitterness of their exile, their passion for fighting, and their longing for their native land. . . .

The rest of the poems are not of Ireland abroad, but of Ireland at home, nor yet of Ireland in the past, but in the present. They are rarely touched with hope, and never with gaiety. But they represent well the deep-seated sorrow and love of country which prevails in Ireland below the political squabbles, the religious distrustfulness, and the battle for the land; and which affects all parties, however opposed to one another. A true poet sits in the centre of things, among universal emotions.

SCIENTIFIC TOPICS.

The President of the Jersey City Board of Health has decided that the city hospital is so infected with disease germs that it should be burned, the sanitary conditions being so bad that it is impossible to remedy them.

✧ ✧ ✧

In spite of its enormous size the Cathedral of Notre Dame in Paris has hitherto been simply lighted by wax candles, as gas, it was thought, would damage the walls and valuable paintings. Now, we understand, that it is about to be electrically lit. The cost of installing the electric light is estimated at 90,000 dollars.

✧ ✧ ✧

A despatch from Bucyrus, Ohio, says that the American Clay-Working Company of that place has given an order for machinery to manufacture an artificial fuel from clay which has undergone a chemical treatment. The invention was discovered by an old railroad engineer of Omaha, Neb., named Hofman. It is said that the heat given out by the fuel is greater than coal, and there is almost no ash remaining.

✧ ✧ ✧

On the banks of the Raritan River and on the outskirts of the thriving town of Perth Amboy, N.J., there is located the largest copper-refining works in the world. Here in the course of every month, some 10,000,000 to 12,000,000 pounds of refined copper are deposited in the Tank House, while the monthly output from the refining furnaces varies from 15,000,000 to 18,000,000 pounds. The Raritan Copper Works are devoted exclusively to the electrolytic refining of the product of the great smelters of the West.

✧ ✧ ✧

A peculiar speed-measuring device for automobiles has recently been patented. The instrument is enclosed in a metal case with a glass front, the whole being as nearly dust and air proof as possible. In the inner case are two fans, the larger one receiving its impulses from the vehicle tire and the smaller one deflected by the air currents set up by the larger fan. The arbor on which the small fan is mounted carries a pointer and is encircled by a half-spring providing the counter-force. When the speed of the vehicle is to be measured, the roller at the end of the shaft is brought into direct contact with the tire of one of the road wheels.

✧ ✧ ✧

The recent snowstorms, which partially blocked the enormous traffic of New York city, brought to light three curious machines employed by the Street Cleaning Department for the removal of snow. In general appearance these snow melters resemble a road roller without rollers. In place of the forward rollers is a large iron box, into which a dozen men shovel snow. Behind the box and extending to the rear end of the machine is a boiler, from which two funnel-shaped pipes about a foot in diameter extend into the box. Steam is forced from these pipes through jets into the box, and the snow melts as fast as it is dumped into the box. The water runs down into a sewer. In eleven hours one machine removed 750 yards of snow. Nine teams wer eable to do the work for which 75 were formerly required.

✧ ✧ ✧

A Chicago inventor has applied the Wheatstone bridge to the very novel purpose of detecting the presence of metals in the earth. The terminals of the bridge are inserted in the earth at a definite dastance apart, and the reading of the resistance boxes taken, thereby showing the resistance included in the space between the two terminals. If ores or minerals be present, then the resistance of the earth at the particular point where the measurement is taken will be less than if no ore or mineral were present, by reason of the well-known fact that a current will seek the path of least resistance. The inventor, therefore, claims that by comparing the measurements taken in different places of the same region, the location as well as the presence of the ore can be detected. When the location is once determined, the depth below the surface is to be ascertained by varying the distance between the terminals and comparing the corresponding readings of the rheostat.

✧ ✧ ✧

The history of the wire-wound gun, which was invented by Mr. J. Longridge, the famous engineer, throws some light on the insouciance and apathy that formerly enveloped the British War Office. Longridge invented the gun in 1854, and did all in his power to place it before the authorities, but they would have nothing to do with it. Thirty years afterwards, however, the Ordnance Department at Woolwich subjected one of the guns to exhaustive tests, and so satisfactory were the results that they declared that nothing could equal it for heavy ordnance. Unfortunately, the inventor died from a broken heart before this end was attained.

✧ ✧ ✧

The Prakischer Maschinen-constructeur describes a method of preserving wood by electricity, which is applicable not only to railway ties, telegraph posts, and the like, but also to fine woods used in making furniture. The apparatus employed comprises essentially a wood trough, on the bottom of which a lead plate is carried, connected with the positive pole of a source of electricity. The wood to be treated is placed upon ths plate and covered with a second plate connected with the negative pole. The trough is filled with a solution of borax, resin, and sodium carbonate. Under the influence of the current the sap of the wood exudes and rises to the surface of the bath, its place being taken by the preserving solution. After five or eight hours of this treatment the wood is removed and dried, either in the open air or in a drying oven. The current used has a tension of 110 volts. The consumption of energy is about 1 kilowatt hour per cubic meter of wood. For wood freshly cut and very moist, the current expenditure is still less. The temperature of the leaching bath varies from 40 to 45 deg. C.

✧ ✧ ✧

It has been one of the peculiarities of the fruit industry of the United States that the makers of baskets have found it difficult to cope with the overwhelming orders of the fruit-growers. This unfortunate peculiarity has been due primarily to the fact that all fruit-baskets used in America have been produced by hand. In 1894 a machine was patented by Mr. Emmet Horton, which was the first practical apparatus for the mechanical making of baskets. Horton did not stop with the invention of a solitary labour-saving device. Continuing his work, he devised improvements, simplified complex constructions, increased the operative efficiency, and at last produced a machine that could turn out more baskets in an hour than could twelve skilled basket-makers under the old system. When it is considered that the machine can be operated at a cost less than the wages of a single workman, that the baskets are produced as rapidly as they can be counted, and that they are better and stronger than those made by hand, the industrial possibilities of such a machine are evident.

✧ ✧ ✧

In a recent article the "Echo des Mines et de la Metallurgie," says that three electric furnaces of 500 horse power each have been erected in the valley of Camonica, Northern Italy, for the manufacture of pig iron under the Stassano patent. In these furnaces the electrodes are placed at the bottom of the boshes. In the operation of the furnaces the ore is first pulverised; a sample is then analysed for the purpose of calculating the amount of carbon required to perform the reduction, as well as the necessary amount of fluxes. The quantities of carbon, lime, or silica thus determined are pulverised and mixed with the ore. The material is then briquetted, after adding five to ten per cent coal tar, and is ready for charging into the furnace. By means of the heat developed around the electric arc, the iron ore is decomposed, the oxygen uniting with the carbon to form CO2. The latter gas ascends into the upper part of the furnace, where it effects a partial reduction of the ore. To obtain a ton (metric) of metal, 3,000 horse power hours are said to be required, costing about 18 francs.

✧ ✧ ✧

A curious solution of the telephone relay problem is offered in a patent granted October 15 to one Bela Gati, of Temesvar, Austria-Hungary, says the "Electrical World." The inventor connects one winding of each of two repeating coils by a circuit containing a generator and an arc lamp, which may be either in series or in parallel with the windings of the coils. The theory is that the weak telephone currents traversing the transmitting circuit, act by induction upon the lamp circuit, and cause corresponding increase and decrease of current therein, which, in turn, will cause the carbons of the lamp to vary in their seperation, thereby decreasing the resistance of the lamp circuit and increasing the supply of current from the lamp supply circuit. This amplified current will correspondingly reinforce an induction in circuit and send out to the receiving telephone much stronger impulses than were created by the voice in the speaking circuit. This is certainly a strikingly bold attempt at the telephonic relay problem, but it would require a delicacy in carbon feeding mechanism difficult to attain, to say the least, while in practice the arc lamp circuit, through its normal fluctuation, would have something to say for itself with rather a disturbing effect on telephone currents.

✧ ✧ ✧

An apparatus which is intended to occupy the place of the atmosphere, so far as concerns the necessary breathing to sustain life, has been invented by M. G. F. Joubert, late Professor of Chemistry at the Paris Ecole Polytechnique. The apparatus is specially intended for the use of divers, or for those whose occupation requires them to enter places where there are noxious gases. The invention consists principally in the manufacture of a substance which the Professor calls "Oxylithe." This chemical, which emits oxygen, has the general appearance of a stone, and resembles the well known calcium carbide. By means of this discovery, in addition to a process of aborption of carbonic acid gas, M. Joubert claims to be able to produce a complete "breathing cycle," which sustains life without the aid of the atmosphere, and without any inconvenience to the subject of the experiment. The person whom Professor Joubert submitted to several tests had an apparatus fixed over his mouth and nose. He inhaled the artificial air by a tube connected to one end, and breathed out the vitiated air into a second tube connected with the other end of the apparatus. Mr. Joubert also conceived the idea of applying his invention to an explosion engine, and to substantiate his claim, he obtained a $1\frac{3}{4}$ h.p. petrol. motor for the propulsion of motor cars, to demonstrate how it might be utilised for this purpose. The first experiment was perfectly successful, and the motor worked in a closed cycle without any assistance from the outside air, either as regards the supply of oxygen or the exhaust of the waste gases. Other larger engines were then experimented with, with the result that it was found that for a given power, the consumption of gas, petrol, or alcohol was reduced by 30 per cent., by means of the new process. The most important application of this invention will be in connection with submarine boats. It has hitherto been difficult to make use of any motive power in submarines, except that derived from electrical storage batteries.

GLIMPSES OF THE PAST.

From the Dublin Newspapers of 1793.

APRIL 23.—This day, in the Court of King's Bench, Beresford Burston, Esq., one of his Majesty's counsel of law, applied for an information against John Giffard, Esq., at the prosecution of his Grace the Duke of Leinster, and the rule was accordingly ordered, unless cause shown in four days.

Counsel on behalf of James Napper Tandy, Esq., applied yesterday in the King's Bench to the Court for a writ of certiorari to remove an indictment found against James Napper Tandy, Esq., at the last Assizes holden for the county of Louth, at Dundalk, which was awarded accordingly.

The Attorney-General moved in the same court for a similar writ, to remove an indictment found against the same James Napper Tandy, Esq., at the said Assizes for an offence.

It is said that these indictments are to be removed in order to outlaw Mr. Tandy.

The Recorder, the same day, made an application to the Court of King's Bench for an attachment against Henry and Thomas Ormsby, marshal and deputy-marshal of the Four Courts Marshalsea, for insulting Thomas Fleming, one of the Aldermen, and Coroner for the city of Dublin, in the execution of his office, in holding an inquest in the Four Courts Marshalsea on the body of a person who had died of a fever.

The Court desired him to change his motion, and make it for an information, and they would grant a conditional rule.

Mr. Browne, on the same side, pressed the attachment, as a summary prevention of the dangers arising from the bad example of the ... ichal, as it was sworn, that riots had frequently existed in the Marshalsea.

Mr. Vavasor said that, when the business was inquired into, the magistrate would appear more culpable than the marshal.

The Court made a conditional order upon the Mr. Ormsbys for an information, unless cause shown in four days.

Lord Clonmel was pleased to deliver the opinion of the judges, respecting the fees to be paid by Roman Catholics on taking the oaths:—That the Act was silent as to the payment of any fees but for the certificate, which was ascertained to be one shilling: no other could be demanded, unless the legislature explained, and ascertained it. His Lordship expressed himself in the most impartial, handsome, and complimentary manner to that respectable body to whose interests in the legislature his Lordship appeared most warmly attached.

The following is the list of the colonels of the militia in the several counties and principal cities of this kingdom:—

COUNTIES.	COLONELS.
Antrim	Mr. J. O'Neil
Armagh	Viscount Gosford
Carlow	Colonel Bruen
Cavan	Earl Bellamont
Clare	Viscount Conyngham
Cork (county)	Viscount Kingsborough
	Viscount Donerail
Cork (city)	Colonel Longfield
Donegal	Mr. B. Conyngham
Down	Earl Hillsborough
Dublin (county)	Lord Mountjoy
Dublin (city)	Alderman Sankey
Fermanagh	Earl Enniskillen
Galway	Col. P. K. Trench
Kerry	Earl Glandore
Kildare	Colonel Keating
Kilkenny	Viscount Thurles
King's County	Sir Lawrence Parsons
Leitrim	Col. Theo. Clements
Limerick (county)	Lord Muskerry
Limerick (city)	Mr. Prendg. Smith
Longford	Earl Granard
Louth	Hon. Mr. Foster
Londonderry	Right Hon. Mr. Conolly
Mayo (county)	Hon. D. Browne
	Mr. Jackson
Meath	Lord Headford
Monaghan	Col. J. Montgomery
Queen's County	Lord Portarlington
Roscommon	Earl Kingston
Sligo	Right Hon. H. King
Tipperary	Mr. Bagwell
Tyrone	Marquis Abercorn
Waterford	Marquis Waterford
Westmeath	Earl Westmeath
Wexford	Viscount Loftus
Wicklow	Lord Wicklow

28. A most excellent charity sermon was preached in St. Peter's Church by the Rev W. B. Kirwan, and a collection made in aid of the fund for support of the Female Orphan House, amounting to £804 2s. 6d. The collectors were Ladies Antrim, L. Conolly, De Vesci, Gosford, Leitrim, Kingsborough, Headford, Sunderlin, and Fitzgibbon; Mrs. Knox, Ponsonby, Howard, Weldon, and Vesey.

Mr. James Napper Tandy has brought an action, in the Court of Exchequer, against Mr. Cox, the jailer of Newgate, for holding him in custody without any other authority than a proclamation by the Lord Lieutenant and Council, directing him to do so.

The Hon. Pierce Butler, lately confined in Newgate for an assault, has brought an action in the same court against Mr. Justice Downes, for an alleged informality in passing sentence on him in his judicial capacity.

In the course of the present term, the Recorder, on behalf of Mr. Justice Downes, and Mr. Ball, on behalf of Mr. Cox, moved the court for time to plead to the declaration in both the above actions, which was granted; time till the first day of next term was given to Mr. Ball; and the Chief Baron observing, that they were actions of a very new kind, gave the Recorder till the first day of next Michaelmas term.

A vessel which failed about three weeks ago from hence to Chatham, with 120 recruits, under the command of Captains Shaw and Petit, together with another officer, is captured by a French privateer in the British Channel, and brought into Dieppe. The officers write that the commandant of that town had all their baggage and all private property restored, and otherwise treated them with the utmost politeness.

MAY 3.—Last Tuesday night a burglary and murder, of the most atrocious kind, was committed in the house of Samuel Waddy, Esq., at Jamesville, in the county of Wexford, the particulars of which are as follows:—Some time ago Mr. Waddy discharged from his service a man who acted in the capacity of footman, for misdemeanours; particularly for beating in a cruel manner a female servant in the family. The fellow, on going away, vowed vengeance against his master, and unhappily kept his word; for, between the hours of nine and ten on Tuesday night, the fellow, with a number of accomplices, broke into Mr. Waddy's house, where, after tying all the servants, he proceeded to Mr. Waddy's bedchamber, where he discharged a pistol at his head, which instantly killed him. The villains robbed the house of valuable articles to a considerable amount, and got off. A strict search is making after this diabolical villain.

6. Yesterday, in the Court of Exchequer, a trial at bar commenced in the case of Warden Flood, Esq., versus the Provost and Fellows of Trinity College, to recover the estate bequeathed by his eldest brother, the late Henry Flood, Esq., to that University. The question is to try the legitimacy of the latter.

The prime sergeant took up nearly the whole time the Court sat, in a very able, learned, and ingenious statement of the case.

The flower of the bar is retained in this cause.

We have the pleasure to learn that the miscreant who committed the horrid murder of Mr. Waddy, was taken two days afterwards at Graigenemagh, in the county of Kilkenny, by Mr. Ambrose Hughes and Mr. Robert Sparrow, two gentlemen of the county of Wexford, and brought to the jail of that place.

Such was the phrenzy of the populace of Wexford against this barbarian, that they were restrained, with the utmost difficulty, from tearing him piecemeal; Mr. Waddy, the gentleman whose life he wantonly and barbarously destroyed, being a gentleman of considerable property, and a friend to the poor, and universally beloved.

The villain apprehended calls himself John Spain. He was imprudently taken into the service of Mr. Waddy without any recommendation, though a strange vagrant in the country.

He had not lived long in the family when he committed several thefts; and, amongst others, one of some silver spoons, in which he was detected by a female servant, who communicated the matter to his master's niece, by whom it was told to Mr. Waddy, who instantly discharged him.

In revenge for which, the fellow formed the horrid plot of murdering his master, the young lady, and the servant maid who detected him.

Mr. Waddy was a gentleman of unwieldy corpulency, weighing nearly thirty stones, of a feeble habit, unable to move without assistance, and consequently to make any resistance.

Notwithstanding which, the villains, after knocking him down, shot him through the head, and afterwards gave him two mortal stabs in the breast and belly.

The Friendly-Brothers' Club of the county of Wexford, with a truly laudable spirit, published a reward of £100 for apprehending the murderer, which Mr. Hughes and Mr. Sparrow, the captors, have generously devoted to the poor of Wexford.

9. Yesterday the whole city was thrown into alarm that a Liberty mob had risen, and were spreading plunder and destruction through the town.

Curiosity, of course, collected the populace in all quarters. The shops from Thomas street, through Dame street, to Stephen green, and in all the streets adjacent, were instantly shut. The alarm, however, though in some measure founded, had no cause equal to the extent of report.

In consequence of the failure of two eminent houses in the cotton branch, and the slackness which has for some time prevailed in the other manufacturing branches, near 5,000 hands, dependant on their industry in these manufactures, were thrown out of employment, and reduced to wretchedness and want.

Instigated by the calls of hunger, numbers of these poor people came forth to seek for relief from the public, and in their way some of them became riotous, and took by violence, from some huxters and bakers' shops, quantities of bacon, bread, etc.

The Lord Mayor, Alderman James, Warren, and Fleming, and the two Sheriffs, immediately came forward, attended by some troops from the garrison, to preserve the peace, and, by persuasion and remonstrance on the impropriety of such conduct, dispersed them.

They then divided into groups, and begged relief from all passengers they met, but we do not hear of any violence committed by them.

The distress of these unfortunate people certainly calls aloud for the interference of public humanity.

Yesterday a subscription for the support of poor manufacturers out of employ, was entered into by the gentlemen of the bar in the courts, and some hundreds collected.

Some other humane expedients of the same kind are mentioned to be in agitation among the great folk.

BELFAST.

HIGH STREET, SEVENTY YEARS AGO.

(From Lewis's "Topographical Dictionary of Ireland, 1837.)

Belfast, a seaport, borough, market town, and parish, partly in the barony of Lower, but chiefly in that of Upper, Belfast, county of Antrim, and province of Ulster, 8 miles (S. by W.) from Carrickfergus, 13¼ (S.E. by E.) from Antrim, and 80 (N.) from Dublin; containing, in 1821, 44,177, and in 1831, 60,388 inhabitants, of which latter number 53,287 were in the town and suburbs, and 48,224 in the borough; and within three years after the latter census the population of the parish had increased nearly 7,000 more. At a very early period this place obtained, according to some writers, the appellation of "Bealafarsad," which has been supposed to signify "Hurdlesford town," and according to others that of "Beala-fearsad," "the town at the mouth of the river"; which latter is accurately descriptive of its situation on the river Lagan, near its influx into the lough or bay of Belfast. But, perhaps, a still more probable conjecture is that which ascribes its etymology to the Irish "Ball-Fosaght," signifying "the town with a ditch or foss," which, from its low situation, were anciently constructed round the town, to protect it from the tide. Previously to the English conquests in the province of Ulster, it appears to have been a fortified station commanding the passage of the river, which is here fordable at low water, and important also from its position on the line between the ancient stations of Carrickfergus and Ardes, respectively in the counties of Antrim and Down, between which the Lagan has ever been regarded as the boundary. The original fort, of which the site is now occupied by St. George's church, was taken and destroyed about the year 1178, by John de Courcy, who soon after erected a noble castle on a more eligible spot. King John marched his army to this place, in 1210; but no notice of any town occurs till the year 1316, when the destruction of the town and castle by Edward Bruce is recorded. The Irish chieftains, having by his aid recovered their ancient possessions, rebuilt the castle, of which, through the intestine divisions in England and their union with the English settlers in Ulster, they kept uninterrupted possession for nearly two centuries, till the reign of Hen. VII., when the Earl of Kildare, at the head of a large army, in 1503, took and destroyed the town and castle; but the latter was soon afterwards repaired by the native chieftains, from which, however, their forces were again driven by the earl, in 1512, and compelled to retire to the mountains. From this period, Belfast remained in a ruined and neglected state, till the year 1552, when Sir James Crofts, lord-deputy, repaired and garrisoned the castle; and during the same year the Irish of Ulster again appeared in arms, under the command of Hugh Mac Nial

Oge, but the English government offered terms of accommodation which that chieftain accepted, and, swearing allegiance to Hen. VIII., he obtained a grant of the castle and town of Belfast, with other extensive possessions. After the death of Hugh, who was killed in 1555 by a party of Scottish marauders, his possessions passed to other branches of his family, with the exception of the castle, which was placed in the custody of Randolph Lane, an English governor; in the 13th of Elizabeth it was granted, with its extensive dependencies, to Sir Thomas Smythe and his son, on the condition of their keeping a certain number of horse and foot in readiness to meet at Antrim after a brief notice, to attend upon the lord-deputy. In 1573 the Earl of Essex visited the fortress, which the Irish had previously, on different occasions, frequently attempted to take by surprise; and in 1575 the Lord-Deputy Sydney encountered the Irish forces at the ford of this place. About that period, Belfast is said to have had a forest and woods, of which all traces have long since disappeared. After the death of Elizabeth, the garrison, influenced by Hugh O'Nial, Earl of Tyrone, refused submission to the English crown; but, on the defeat of that powerful leader and his adherents, the English gained the ascendancy, and Sir Arthur Chichester, lord-deputy in the reign of Jas. I., issued his summons requiring the supplies of horse and foot, according to the tenure by which the castle was held; and no one appearing in answer to this requisition, the castle and demesne became forfeited to the crown, and were given to Sir Arthur in 1612.

Prior to the civil war in 1641, the town had attained a considerable degree of commercial importance, and was the residence of many merchants and men of note; but the inhabitants, being chiefly Presbyterians, suffered severely for refusing to conform to the Established Church; many of them left the kingdom, and those who remained embraced the parliamentarian interest. The immediate local effect of this rebellion was the suspension of all improvements, but the town was saved from assault by the defeat of the rebels near Lisburn; and, while the insurgents were overpowering nearly all the surrounding country, Belfast was maintained in security by the judicious arrangements of Sir Arthur Tyringham, who, according to the records of the corporation, cleared the water-courses, opened the sluices, erected a draw-bridge, and mustered the inhabitants in military array. In 1643, Chas. I. appointed Col. Chichester governor of the castle, and granted £1,000 for the better fortifictaion of the town, which, while the people of the surrounding country were joining the Scottish covenanters, alone retained its firm adherence to the royal interest. The royalists in Ulster, anticipating an order from the parliament for a forcible imposition of the Scottish covenant, assembled here to deliberate upon the answer to be returned to Gen. Monroe, commander of the Scottish forces in Ireland, when required to submit to that demand; but the latter, being treacherously informed of their purpose, and favoured by the darkness of the night, marched to Belfast with 2,000 men, surprised the town, and compelled them to retire to Lisburn. The inhabitants were now reduced to the greatest distress; Col. Hume, who was made governor of the castle for the parliament, imposed upon them heavy and grievous taxes, and the most daring of the Irish insurgents were constantly harassing them from without. After the decapitation of Chas. I., the

Arms.

presbytery of this place, having strongly expressed their abhorrence of that atrocity, were reproachfully answered by the poet Milton; and the Scottish forces of Ulster having, in common with the covenanters of their native country, embraced the royal cause, the garrison kept possession of it for the king. But Gen. Monk, in 1648, seized their commander, Gen. Monroe, whom he sent prisoner to England, and having assaulted Belfast, soon reduced it under the control of the parliament, who appointed Col. Maxwell governor. In 1649 the town was taken by a manœuvre of Lord Montgomery; but Cromwell, on his arrival in Ireland, despatched Col. Venables, after the massacre of Drogheda, to reduce it, in which enterprise he succeeded.

On the abdication of Jas. II., the inhabitants fitted out a vessel, and despatched a congratulatory address to the Prince of Orange, whom they afterwards proclaimed king; but, within a few days, James's troops having obtained possession of the place, many of the inhabitants fled to Scotland and elsewhere for safety, and several of the principal families were placed under attainder. On the landing of Duke Schomberg at Bangor, on Oct. 13th, 1689, with an army of 10,000 men, the Irish forces evacuated the town, of which Col. Wharton took possession in the name of King William: a reinforcement of 7,000 well-appointed troops from Denmark shortly after joined the forces of Schomberg, which had encamped under the walls; and on June 14th, 1690, the king arrived in person, and issued from this town a proclamation to the army forbidding them to lay waste the country. The king remained here for five days, whence he proceeded to the Boyne by way of Hillsborough, and on his march issued an order to the collector of the customs of Belfast, to pay £1,200 per annum to the Presbyterian ministers of Ulster, which grant formed the origin of the more extensive royal bounty at present paid to that body. The castle was destroyed by an accidental fire in 1708, and has not been rebuilt. In 1715, on the threatened invasion of the Pretender, the inhabitants of the town and neighbourhood formed themselves into volunteer corps for the better defence of the country; in 1745 they again had recourse to arms; and in 1760, by their prompt muster, in conjunction with the people of the surrounding country, they saved their town from the French under Thurot, who had landed at Carrickfergus, intending to surprise Belfast; but, overawed by the muster of 12,000 men, posted within two miles of Carrickfergus on the road to Belfast, he hastily re-embarked, after having obtained a considerable supply of brandy, wine, and provisions from the merchants of that town. The formation of the Irish volunteers induced all the principal young men of Belfast again to accoutre themselves, and they assumed a formidable political attitude, until suppressed with the rest of that body. Notwithstanding the powerful excitement which prevailed towards the close of the 18th century, Belfast, although the centre of motion to the northern union, was preserved in peaceable subjection by the precaution of Government in placing in it a strong military force; but the spirit of disaffection had diffused itself considerably, and seven individuals were executed here for treason. With the exception of commercial difficulties, from which, however, this town suffered less than any other of equal importance in the kingdom, few circumstances have occurred in modern times to retard its progress; and it is now the most flourishing in the island, celebrated alike for its manufactures and commerce, and for the public spirit of its inhabitants in the pursuit of literature and science, and in the support of charitable and other benevolent institutions.

Belfast is in some measure indebted for its incorporation to the favour shown to the Chichester family by Jas. I., who, in 1612, granted to Sir Arthur Chichester, who had previously established a number of Devonshire men in the townland of Malone the castle and an extensive surrounding territory; and in the following year incorporated the inhabitants by charter. In the 4th of Jas. II., on a seizure of the franchises, a charter, the provisions of which were in most respects similar to those of the former, was granted, but is now considered void. Geo. II., in the 33rd year of his reign, also granted a charter, which, however, is only an inspeximus of the charter of Jas. I.

The borough returned two representatives to the Irish parliament from the date of its incorporation till the Union.

There are no remains of antiquity in the town, though some are scattered over the parish: near Stranmills, on the Lagan, was an ancient chapel, called "Capella de Kilpatrick"; on the summit of a hill in Upper Malone was the "Capella de Crookmuck"; near Callendar's Fort, on the Fall's road, about two miles from the town, was that of "Cranock," of which traces of the foundations and a large

cemetery are still remaining; and on the same road the chapel of "Kilwee," where numerous elegantly carved crosses and other sepulchral monuments have been found. About three miles on the Carrickfergus road is a small fragment of an ancient fortress, called Greencastle; in Upper Malone was an extensive fort called Castle Cam, or Freeston Castle, on the site of which the elegant mansion of Malone House has been erected; at a small distance on the left of the road to Shaw's-bridge are seen the foundations of a third fort; on the grounds of Malone, near Lismoine, are the remains of a fourth; and in the R. C. burial-ground at Friar's Bush are the remains of a fifth. Among the most curious relics of antiquity are the caves in various places formed in the earth and in the hard limestone rock; of the former, three were discovered in 1792 at Wolf Hill, the largest of which is eight yards long and one yard wide, with four small chambers diverging from it; on the side of a small hill in the townland of Ballymargy is one of larger dimensions, and in a more perfect state, with two entrances; and near Hannahstown is one still larger, which since 1798 has been closed, having at that time been a place of concealment for arms. Three large caves, which give name to the mountain called Cave Hill, are all formed in the perpendicular face of an immense range of basaltic rock: the lowest is 21 feet long, 18 wide, and from 7 to 10 feet in height; above this is another, 10 feet long, 7 wide, and 6 in height; and above that is a third, said to be divided into two unequal parts, each of which is more extensive than the largest of the other caves; but the ascent is so dangerous that few venture to visit it. The largest ramparts of earth, called raths, or forts, are also numerous: of these the most extensive is Mac Art's fort, on the summit of Cave hill, protected on one side by a precipice, and on the others by a single ditch of great depth and a vallum of large dimensions; the enclosed area is nearly level, and, from the height of the mountain, which is 1,140 feet, commands a view of vast extent, variety, and beauty, including the Isle of Man, the Shores and mountains of Scotland, and a large portion of the counties of Antrim, Down, Armagh, Derry, and Donegal. Near the base of Spires hill are many raths, and two of large dimensions almost at the summit of the Black mountain; and near the shore, at Fort William, is an encampment, 70 feet square, surrounded by a deep fosse and defended by a bastion at each angle, and said to have been thrown up by King Willian in 1690; near it is another entrenchment of ruder construction. There are two large cairns on the Black mountain, in one of which, in 1829, was found a large urn filled with calcined human bones, a spear-head, and two ornaments of brass; there is also a cairn on Cave hill, and one on Squires hill. Great numbers of stone and flint hatchets, and arrow heads of flint, have been discovered; and brazen celts and querns, or hand-mill-stones, are occasionally found.

NAPOLEON AND JOSEPHINE.

A PARCEL OF OLD LETTERS.

What is the truth about Napoleon? After a century of conflicting testimony, during which prejudice has pictured him as a brutal tyrant and hero-worship as a god, the actual facts about him seem in a fair way to see the light.

No contribution more important to those who wish to obtain a correct view of Napoleon the Man than his "Love Letters to Josephine," recently published can well be imagined.

Every phase of the romance of "this greatest military genius of 2,000 years," from his first acquaintance with Josephine as the widow Beauharnais to the days when he wearied of her and cast her off, is thoroughly illuminated by this correspondence.

"TAKE WINGS, COME QUICKLY."

Bonaparte married Josephine on March 9, 1796. Two days after he tore himself from her, from Paris, to take command of his army. He found time to shower letters on her in the intervals of thrashing the Austrians and Sardinians. At Canu, April 24, he wrote to her:—

"To my sweet love.—You have been several days without writing me. What are you doing then? Yes, my kind love, I am not jealous, but sometimes uneasy. Come soon. I warn you, if you tarry you will find me ill; fatigue and your absence are too much for me at the same time.

"Your letters make up my daily pleasure, and my happy days are not often. Gunot bears to Paris twenty-two flags. You ought to return with him, do you understand? Be ready, if that is not disagreeable to you. Should he not come, woe without remedy; should he come back to me alone, grief without consolation, constant anxiety.

"My beloved, he will see you, he will breathe on your temples; perhaps you will accord him the unique and priceless favour of kissing your cheek, and I, I shall be alone and very far away; but you are about to come, are you not? You will soon be beside me, on my breast, in my arms. Take wings, come quickly, but travel gently. The route is long, bad, fatiguing. If you should be overturned or be taken ill, if fatigue—go gently, my beloved.

"N. B."

"I know not if you want money, for you never speak to me of business. If you do, will you ask my brother for it?—he has 200 louis of mine!

"A LA CITOYENNE BONAPARTE, ETC."

Two hundred louis! After he divorced her the Emperor gave Josephine a yearly allowance of £125.000. And having it she ran into debt.

"MY UNIQUE JOY."

Milan surrendered. Josephine joined her victorious husband there. He writes to her at Milan:—

"Marmivolo, July 19, 1796.

"I have been without letters from you for two days. That is at least the thirteenth time to-day I have made this observation to myself. You are thinking this particularly wearisome, yet you cannot doubt the tender and unique anxiety with which you inspire me.

"I have received a courier from Paris. There were two letters for you. I have read them. But though this action appears to me quite natural, and though you gave me permission to do so the other day, I fear you may be vexed, and this is a great trouble to me. I should have liked to have sealed them up again; fie, that would have been atrocious! If I am to blame, I beg your forgiveness. I swear that it is not because I am jealous; assuredly not. I have too high an opinion of my beloved for that. I should like you to give me full permission to read your letters, then there would be no longer either remorse or apprehension.

"Achille has just ridden post from Milan; no letters from my beloved! Adieu, my unique joy. When will you be able to rejoin me? I shall have to fetch you myself from Milan.

"A thousand kisses as fiery as my soul, as chaste as yourself.

"I have summoned the courier. He tells me that he crossed over to your house and that you told him you had no commands. Fie! naughty, undutiful, cruel, tyrannous, jolly little monster. You laugh at my threats, at my infatuation. Ah, you well know that if I could shut you up in my breast I would put you in prison there!

"Tell me you are cheerful, in good health, and very affectionate.

"BONAPARTE."

"YOU DO NOTHING BUT CRY."

On May 18, 1804, the First Consul became the Emperor Napoleon; Josephine an Empress. The tone of his letters soon changed. During the campaign against Russia and Prussia, 1806-1807, he wrote to her at Mayence:—

"Talleyrand has just arrived, and tells me, my dear, you do nothing but cry. What on earth do you want? You have your daughter, your grandchildren, and good news; surely these are sufficient reasons for being happy and contented."

Again to the Empress at Mayence:—

"Warsaw, Jan. 7, 1807.

"My Dear.—I am pained by all that you tell me; but the season being cold, the roads very bad, and not at all safe, I cannot consent to expose you to so many fatigues and dangers. Return to Paris in order to spend the winter there. Go to the Tuileries, receive and lead the same life as you are accustomed to do when I am there; that is my wish. Perhaps I shall not be long in rejoining you there; but it is absolutely necessary for you to give up the idea of making a journey of 750 miles at this time of the year, through the enemy's country and in the rear of the army.

"Believe that it costs me more than you to put off for some weeks the pleasure of seeing you, but so events and the success of my enterprise order it.

"Adieu, my dear; be cheerful and show character.

"NAPOLEON."

"BE WORTHY OF ME."

Yet two more letters, both to the Empress at Mayence, in contrast to the burning missive of General Bonaparte to the widow Beauharnais:—

"Warsaw, Jan. 18, 1807.

"I fear that you are greatly grieved at our separation and at your return to Paris, which must last for some weeks longer. I insist on your having more fortitude. I hear you are always weeping. Fie! how unbecoming it is! Your letter of Jan. 7 makes me unhappy. Be worthy of me; assume your character. Cut a suitable figure at Paris, and, above all, be contented.

"I am very well and love you much; but if you are always crying I shall think you without courage and without character. I do not love cowards. An Empress ought to have fortitude.

"NAPOLEON."

"RETURN TO PARIS."

And again this, so well calculated to dry Josephine's tears:—

"Warsaw, Jan. 23, 1807.

"Your letter of Jan. 15 to hand. It is impossible to allow women to make such a journey as this—bad roads, miry and unsafe. Return to Paris; be cheerful and content there. Perhaps even I shall soon be there. I have laughed at what you say about your having taken a husband to be with him. I thought in my ignorance the wife was made for the husband; the husband for his country, his family, and glory. Pardon my ignorance, one is always learning from our fair ladies.

"Adieu, my dear. Think how much it costs me not to send for you. Say to yourself, 'It is a proof how precious I am to him.'

"NAPOLEON."

In her turn Josephine became jealous. Her spouse thus addressed her from Finckenstein in May, 1807:—

"I have just received your letter. I know not what you tell me about ladies in correspondence with me. I love only my little Josephine, sweet, pouting, and capricious, who can quarrel with grace, as she does everything else, for she is always lovable, except when she is jealous; then she becomes a regular shrew (Toute diablesse). But let us come back to these ladies. If I had leisure for any among them I assure you I should like them to be pretty rosebuds.

"Are those of whom you speak of this kind?

"I wish you to have only those persons to dinner who have dined with me; that your list be the same for your assemblies; that you never make intimates at Malmaison of Ambassadors and foreigners. If you should do the contrary you would displease me. Finally, do not allow yourself to be duped too much by persons whom I do not know, and who would not come to the house if I were there.

"Adieu, dear. Yours ever,

"NAPOLEON."

Nor could this letter have soothed the jealousy of the Empress at St. Cloud:—

"Tilsit, July 1, 1807.

"The Queen of Prussia is really charming; she is full of coquetterie for me; but don't be jealous; I am in oilcloth over which all that can only glide. It would cost me too much to play the lover.

"NAPOLEON."

"MY EXCELLENT JOSEPHINE."

Bourriene writes that Napoleon thus apostrophized the childless Josephine ere he divorced her in December, 1809:—

"Josephine, my excellent Josephine, thou knowest if I have loved thee! To thee, to thee alone do I owe the only moments of happiness I have enjoyed in this world. Josephine my destiny overmasters my will. My dearest affections must be silent before the interests of France."

Perhaps Napoleon was sincere, but one who carefully studies his letters doubts it. After the divorce, and both before and after his marriage with Marie Louise, Napoleon visited Josephine; they often corresponded. Thus the Emperor wrote to her at Malmaison:—

"December, 1809, 8 P.M.

"My Dear.—I found you weaker to-day than you ought to be. You have shown courage; it is necessary that you should maintain it and not give way to a doleful melancholy. You must be contented and take special care of your health, which is so precious to me.

"If you are attached to me and if you love me, you should show strength of mind and force yourself to be happy. You cannot question my constant and tender friendship, and you would know very imperfectly all the affection I have for you if you imagined that I can be happy if you are unhappy, and contented if you are ill at ease.

"Adieu, dear. Sleep well; dream that I wish it.

"NAPOLEON."

"TO PAY YOUR DEBTS."

But he made most generous provision for her. He thus wrote to her at Malmaison:—

"Sunday, 8 P.M., 1810.

"I was very glad to see you yesterday. I feel what charms your society has for me.

"To-day I walked with the Esteve (General Treasurer of the Crown). I have allowed £4,000 for 1810 for the extraordinary expenses at Malmaison. I have instructed Esteve to send £8,000 the moment the contract for the Maison Julien shall be made. I have ordered them to pay for your parure of rubies, which will be valued by the Department, for I do not wish to be robbed by jewellers. So there goes the £16,000 this may cost me,

"I have ordered them to hold the million which the Civil List owes you for 1810 at the disposal of your man of business, in order to pay your debts.

"You should find in the coffers of Malmaison £20,000 to £25,000; you can take them to buy your plate and linen.

"I have instructed them to make you a very fine porcelain service; they will take your commands in order that it may be a very fine one.

"NAPOLEON."

In December of 1810 Napoleon wrote to the wife he had put away:—

"I hope to have a son. I shall let you know immediately." He added: "When you see me you will find me with my old affection for you."

On March 20 was born the King of Rome—"a pompous title buried in the tomb of the Ostrogoths." Two days later the Emperor, in Paris, wrote to Josephine at Navarre:—

"My dear.—I have your letter. I thank you for it

"My son is fat and in excellent health. I trust he may continue to improve. He has my chest, my mouth, and my eyes. I hope he may fulfil his destiny.

"NAPOLEON."

LETTERS FROM JOSEPHINE.

Towards the last the Emperor expresses, mayhap assumes, a little of the old devotion. The cynical will say he could afford to, his second wife having borne him a son. The interesting and valuable book contains two letters from Josephine to Napoleon. Here is part of one written by her at Navarre, April 19, 1810:—

"Sire.—I have received by my son the assurance that Your Majesty consents to my return to Malmaison, and grants to me the advances asked in order to make the chateau at Navarre habitable. This double favour, sire, dispels to a great extent the uneasiness, nay, the fears that Your Majesty's long silence has inspired. I was afraid that I might be entirely banished from your memory. I see that I am not. I am, therefore, less wretched to-day. and even as happy as henceforward it will be possible for me to be.

"While I am at Malmaison Your Majesty may be sure that I shall live there as if I were a thousand leagues from Paris. I have made a great sacrifice, Sire, and every day I realise more its full extent. Yet that sacrifice will be, as it ought to be, a complete one on my part. Your Highness, amid your happiness, shall be troubled by no expression of my regret.

"I shall pray unceasingly for Your Majesty's happiness, perhaps even I shall pray that I may see you again; but Your Majesty may be assured that I shall always respect our new relationship. I shall respect it in silence, relying on the attachment that you had to me formerly; I shall call for no new proof; I shall trust to everything from your justice and your heart.

"I limit myself to asking from you one favour; it is that you will deign to find a way of sometimes convincing both myself and my entourage that I have still a small place in your memory and a great place in your esteem and friendship. By this means, whatever happens, my sorrows will be mitigated without, as it seems to me, compromising that which is of permanent importance to me, the happiness of Your Majesty.

"JOSEPHINE."

Outwardly meek as are these words, they displeased Napoleon. He answered:—

"Compiegne, April 21, 1810.

"My Dear.—I have yours of April 18 (sic); it is written in a bad style. I am always the same; people like me do not change. I know not what Eugene has told you. I have not written to you because you have not written to me, and my whole desire is to fulfil your slightest inclination.

"I see with pleasure that you are going to Malmaison and that you are contented; as for me, I shall be so likewise on hearing news from you and in giving you mine. I say no more about it until you have compared this letter with yours, and after that I will leave you to judge which of us two is the better friend.

"Adieu, dear; keep well, and be just for your sake and mine."

"I SHALL ALWAYS LOVE YOU."

Josephine hastened to reply:—

"A thousand, thousand loving thanks for not having forgotten me. My son has brought me your letter. With what impetuosity I read it! And yet I took a long time over it, for there was not a word which did not make me weep; but these tears were very pleasant ones. I have found my whole heart again—such as it will always be—. There are affections which are life itself, and which can only end with it.

"I was in despair to find my letter of the 19th had displeased you. I do not remember the exact expressions, but I know what torture I felt in writing it—the grief of having no news from you.

"I wrote you on my departure from Malmaison, and since then how often have I wished to write you! But I appreciated the causes of your silence, and feared to be importunate with a letter. Yours has been the true balm for me. Be happy, be as much so as you deserve it; it is my whole heart which speaks to you. You have also just given me my share of happiness, and a share which I value the most, for nothing can equal in my estimation a proof that you still remember me.

"Adieu, dear. I again thank you as affectionately as I shall always love you.

"JOSEPHINE."

Four years, almost to the day, the Emperor of Austria, her father, sent Marie Louis back to Vienna; scarcely more than another fortnight passed when Napoleon set foot on lonely Elba: in less than a month thereafter Josephine died.

OUR WEEKLY STORY

A MYSTERY OF BATTLE.

The wave of a great battle was at its height, and General C——, of her Britannic Majesty's Army of Invasion in South Africa, surrounded by his staff, stood at the summit of a kopje about half a mile back of the firing line, directing signallers, despatching orders, and receiving reports.

An aide rode up as though he had had orders to charge the little group. "General," he cried, reining in his smoking horse and saluting, "M'Lennon has just been killed. He was with Major Rolfe, of the 40th, in the trench at the right of the line. The Major wants you to send someone to take his place as orderly. 'Any bright young chap,' he said, 'I don't care what his rank is—but he must be brave. The Boers have got our range, and it's hot here.'" Again the aide saluted.

General C—— ran his eye over his staff, every man of whom had drawn a little closer to him while the aide was speaking. A likely fellow that Will Sharples—his eager face told a tale of courage—but, confound it! he was so young looking. He knew the boy's father well. Could he send the boy out to be potted?

"I will go, sir." The voice came from behind General C——, who wheeled quickly to view the volunteer. All this had taken place, mind, while you might have pounded an order into a raw recruit's head.

The General saw a lad of perhaps eighteen, togged out in a nondescript costume composed of the odds and ends always to be picked up by a camp follower on the line of an army's march. He wore parts of the uniforms of an infantryman, a sapper, and a cavalryman, no one part coming near to fit, and, standing there bareheaded in the blaze of the sun, he fingered the cap of a bombardier. He was very thin and sallow-pale, with great, bright, sunken eyes.

"I will go," he repeated, stepping forward a pace or two, and standing at a clumsy imitation of "attention."

"You have a touch of fever," said General C——, not unkindly. "I'll send you to our surgeon. You don't know what you're saying."

"But indeed I do, sir," the lad protested. "Let me speak with you alone for a moment, and I'm sure you'll let me go."

The listeners, who had not been able to conceal their amusement during this brief colloquy, now laughed outright, and the General tapped his forehead meaningly. Then, "Very well," he said, motioning to his staff to go aside a little, "very well, but be d——d quick about it!" He drew himself up with his most important air. Remember, he commanded a brigade and could write V.C. and a lot of other letters that meant less, after his name.

"I will, sir." The lad spoke with much respect. His eye measured the distance between them and the General's staff, and his voice sank to a thrilling whisper as he said, "I am your son. If you want proof"——He broke off, and his hand sought the breast pocket of his jacket.

Now the General, who had never married, was not so startled and indignant as by rights he should have been, for he at once recalled a certain episode of his "days of nature"—a one-act tragedy in which he had played a contemptible if a prominent part. The lad lifted his head proudly, and put one hand on his hip while waiting for an answer, and in that movement General C—— recognised himself and her who slept in an English country churchyard because of his sin.

"Why have you come here?" he asked, and his face grew very dark.

His son faced him without fear. "Because I want my chance," he replied, and before this concentrated reproach the General lowered his gaze to the ground. "That's why I hid in the hold of your ship when she left Southampton; that's why I followed the army on foot all the way from Durban. If I told you what I suffered—yes, what I've suffered ever since I can remember, you'd pity me. But I don't want your pity"—the whisper had become a threatening hiss, the sunken eyes burned feverishly—"I want my chance. I want to make a name."

General C—— took a moment's thought. "I owe it to you," he said. He was accustomed to act quickly, and he had a sense of justice. He held up his hand, and his officers came around him.

"Weatherly," he said to the aide who had delivered the message, "you will take this young man to Major Rolfe. Take him up behind you—he isn't heavy enough to founder your beast," he added, with grim humour. "Now go. Stop a a moment! What's your Christian name, young man?"

"Frank, sir," was called back, as the horse went down the slope with a double burden.

"Frank," the General repeated to himself, "Frank—my name. Then she lived long enough to give it to him. Cur that I was, she loved me." Then, loudly, "Melville, why in God's name haven't you signalled to General Anderson, as I ordered?" When shells are screaming and bursting overhead, sentiment must be beaten down as with a sword.

The General's staff looked curiously at him, and one of them, a rules-of-the-service man by the name of Wharton, muttered—"Extraordinary conduct! The Department ought to hear of this."

Meanwhile the fight raged on. A few minutes passed, and General C—— found himself watching the 40th's line with a new interest. "Do you think they'll be able to hold their position?" he asked the officer on his right. The reply came short and sharp. "Perhaps, General. They're wavering, though."

"What!" roared General C——. His staff jumped as one man.

"Yes. Some of the men are climbing out of the trenches and falling back now. You don't believe it? Here, take my glass, sir; it's stronger than yours."

What the General saw made him grind his teeth and curse. The 40th was his old regiment, his pride, his pet, and his son— He was about to order up another regiment in support, when something happened that made the watchers send up a cheer. The ragged nondescript whom the General had sent forward was seen to leap out of one of the trenches, face to the enemy, and walk up and down in the space of a few yards, standing perfectly erect. The effect was instant. The retreating men, hearing a great cheer roll along the 40th's line, turned and looked and saw that a boy was shaming them with his bravery. Back they tumbled into the trenches, pell-mell, and presently more rifles cracked out. The line was steady again. The honour of the 40th was saved.

"That's the bravest thing I ever saw a civilian do," said someone at General C——'s elbow.

"Civilian!" shouted the General, beside himself with the joy of battle and the pride of fatherhood. "Damme, sir, that boy's no civilian—he's a soldier born and the son of a soldier's son. And if any power on earth can get him the V.C. for this, he shall have it! But why doesn't he lie down? He's done the trick. Oh, my God, he's hit!" General C——'s voice rose to a shrill scream. None of his staff—not even Melville, who had followed him through six campaigns—had ever heard anything like it from him since a certain day of bitter memory in the Soudan, when, a British square being broken by a charge of Dervishes, the General smashed his sword across his knee. Now he turned to his orderly and fairly yelled, "Whitehead, my horse!" Then, to his staff officer, "Sinclair, I appoint you to act in my absence. I'm going to ride to the firing line. Send two stretcher-bearers after me—be quick." His horse's hoofs were pounding down the side of the kopje before his staff had caught their breath.

"Most extraordinary conduct," muttered Wharton again. "The Department shall hear of it."

It was a soldier that cheered and shouted and cried for joy on the little hill; it was a father that now rode forward at a mad gallop, straining his eyes ahead—a father thinking only of his son. The tree of war drops strange fruits, and sometimes love as well as hate is born in the breath of the bullets.

As General C—— rode on, his way became harder to pick because of the dead and wounded scattered over the veldt, and he must slacken speed. Still he was nearly there now, he told himself, nearly there. Only three hundred yards more and he would be by his son's side. He would take him up in his arms and succour him and bring him back to safety. All at once there was a blare of bugles, sounding out a general advance. Mile-long lines of trenches vomited men, who rushed forward, firing, some clutching at the air and falling as they ran; heavy artillery that had been held in reserve behind hills and in dips in the plain began to lurch and limber up; flying cavalry made a dull thunder on the veldt. General C—— bent over his horse's neck and rowelled him till the blood ran down his sides. Now he could just see his son. The boy was lying very still where he had fallen. Was he dead? The General's heart turned to ice. No, no. God be praised, he stirred, he raised himself on one elbow, he even waved his hand to some of the men of the 40th sweeping by him on a run. Oh, how glad the father was—no words could tell it. It was a foolish act, of course—inadequate, absurd; but General C——patted his horse's neck as he rode. Then suddenly he stood up in his stirrups and shrieked: "Frank, Frank, look behind you!" He had seen an enemy coming towards the boy, his weapon in his hand.

"Frank, Frank!" The boy does not hear, for now the heavy artillery has opened fire, and what is one man's voice when the god of battles is bellowing through a thousand throats? So that wild ride turned into a race between love and hate. Love was swift, but hate was sure and silent, and had not far to go.

"Frank, Frank!" At last the boy heard his father's voice and turned, just in time to look death in the face. The knife, held high, for the downward stroke, glittered an instant in the sun. The father closed his eyes: he could not bear to see it fall. When he opened them he was alongside the Boer, whom he sabred. Then he threw himself off his horse and took his boy in his arms, raising him up, hugging him to his breast and calling him by every dear name that the passion of love could prompt. "O, my boy, my brave, brave boy! Speak to me—say you forgive me the wrong I did you. Only speak!"

But his son made him no answer. The colour had fled from the lips his father kissed: try as he might, the General could not redden them with his own. Weeping, forgetting war and the business of war, the father cast himself down in the sand and grieved exceedingly. There was many a strange, sad sight that day, but none stranger, none sadder, I think, than this man of years, and rank, and honours abasing himself beside a dead camp-follower, while memory and remorse kept knocking at his heart.

"General, what are your orders?" It was Sinclair who spoke. The General's staff had ridden up, moving forward with the army's advance, and now were gathered about him again, outwardly imperturbable, as good soldiers always are, but wondering greatly in their minds.

The General sprang to his feet, a leader of men once more. "You will have this boy taken to the rear at once," he said, in a perfectly firm voice. "To-morrow we will bury it with honours—if we live." Two stretcher-bearers ran up, panting.

General C—— uncovered and bent over the little hero to whom he had given his hour,

his "chance." Grotesque enough he was still as to his garb, but no longer the cause of laughter, because touched with the isolation and dignity which we call Death.

"Not to be able to claim you before them all—not to be able to call you my son," the father murmured, so low that only the dead could have heard. Then, turning to his staff, one foot in the stirrup, General C——'s voice sounded out as hard as steel: "It's forward now, and no turning back. That hill must be carried and held, if it costs us a thousand men!"

HOW TO TELL PRECIOUS STONES.

Anyone can tell a genuine diamond or precious stone even from a very clever imitation. There are a few household tests which are practically infallible. The diamond expert, after long years of experience with gems, can detect an imitation, as a rule, at a glance. The layman in such matters, with a few simple tests, takes more time to solve such problems, but his judgment in the end is scarcely less accurate.

An imitation diamond is never so brilliant as a genuine stone. If your eye is not experienced enough to detect the difference a very simple test is to place the stone under water. The imitation stone is practically extinguished, while a genuine diamond sparkles even under water, and is distinctly visible. When possible, place a genuine stone beside the possible imitation under water and the contrast will be apparent to the least experienced eye.

The glass-cutting test is, of course, more or less familiar. It is probably the most common.

False diamonds are usually cut more regular than the genuine stones. In cutting a diamond the material is saved as far as possible. In any imitation the material is itself worthless, and no attempt is made to suit the size or angle of the facets to the form of the stone. It can be put down as a safe rule that when a stone is cut with great evenness and regularity it is, to say the least, a very suspicious sign.

Another very simple and effective test is to put a drop of water on the stone and carefully observe the result. The stone should first be carefully cleaned. On an imitation diamond the drop, however small, will deliquesce. The drop will, however, retain its original shape on a true stone. To make the test quite sure use a magnifying glass when watching the action of the drop.

Still another test of this nature is to pass the stone over a piece of aluminum. Both the metal and the stone should be absolutely free from any trace of grease. The metal will give off some of its colour to an imitation stone, while a genuine diamond will remain perfectly clear and unaffected. Among jewellers the final test is to apply a drop of fluorhydric acid to the stone under suspicion. The acid will eat into any false diamond and frost it, while the genuine stone will not be damaged in the slightest.

Perhaps the simplest method of all, however, is to examine an ink spot on a sheet of white paper through a diamond by holding the upper surface against the eye. If the stone be counterfeit, the black spot will be greatly multiplied, or at least doubled. The outline will, moreover, appear blurred and indistinct. By using a magnifying glass the test can readily be made absolute.

The optical test is the best in examining rubies and emeralds. It is commonly supposed that such stones can be best tested by rubbing them with a file, that the genuine stones resist the steel, while the imitations only will suffer; but the test is not exhaustive. The best plan is to examine them closely with a microscope of about one hundred diameters. The genuine stones have a number of minute flaws, whereas the imitations are likely to be much more nearly perfect in texture.

The imitation ruby is filled with minute air bubbles, which are not found in the genuine stones. The colour of the imitation is sometimes even purer and more even than the real stone. As a rule, any yellowish tinge is considered suspicious. Genuine emeralds are to be determined by tiny flaws, tree-like or dendritic in shape.

ULSTER IN AMERICA.

EARLY IRISH EMIGRANTS.

(Concluded from last week.)

In an appendix to Mr. Hanna's second volume will be found some interesting notes on the genealogies of the Presidents of the United States. We are remmded, for example, that Andrew Jackson, who was born in Lancaster County, S. C., or Union County, N. C., on March 15, 1757, was the son of Andrew Jackson and Elizabeth Hutchinson Jackson, who emigrated to America from Carrickfergus, county Down, Ireland, in 1765, and a grandson of Hugh Jackson, of Carrickfergus. James Knox Polk, born in Mecklenburg county, N. C., on November 2, 1795, was the great-grandson of William and Nancy Knox Pollock. William Pollock (the original form of the name "Polk") was the grandson of Robert Pollock and Magdalene Pasker Pollock, who emigrated with their families from county Londonderry Ireland, to Somerset county, Md., about 1690. James Buchanan, born at Coves Gap, Franklin county, Pa., April 23, 1791, was the son of James Buchanan, who emigrated to Pennsylvania from county Donegal, Ireland, in 1783. Andrew Johnson was the grandson of Andrew Johnson, a native of Ulster, who removed from Pennsylvania to North Carolina about 1750-60. Ulysses Hiram Simpson Grant was of Scotch-Irish descent through his mother, Hannah Simpson, the granddaughter of John Simpson, who was born in the North of Ireland, but emigrated to America and settled about 1763 in Montgomery county, Pa. Chester Alan Arthur was the grandson of Gavin MacArthur, of Ballymena, county Antrim, Ireland. The mother of Stephen Grover Cleveland was Ann Neal, a daughter of Abner Neal, who was born in Ireland. The mother of Benjamin Harrison was Elizabeth Irwin, the great granddaughter of James Irwin, who emigrated from the North of Ireland and settled in Peters township, Franklin county, Pa., before 1750. William M'Kinley was the great great-grandson of Stephen M'Kinley, who was born in the North of Ireland about 1730, and died in York county, Pa., in 1819.

We have seen that the history of the Scotch-Irish in the United States is mainly set forth in the second of Mr. Hanna's volumes. A good deal of interesting matter relating to the same subject will be found in the preliminary chapters of the first volume. We observe, for example, that in a list of 109 names, which include practically all of Washington's Generals, about sixty are non-English. Of these sixty a large majority seem to be Scotch-Irish—the term applied in this book to the descendants in America of Scotch-Presbyterian emigrants from Ireland. Among the Scotch or Scotch-Irish names of Generals in the Revolutionary war we observe those of Henry Knox, John Stark. William Alexander, Alexander M'Dougall, Arthur St. Clair, William Irvine, Lachlan M'Intosh, John Patterson, Charles Scott, George Clinton, and James Clinton. If we turn to the Continental Congress of 1776 we find that eleven of its members were of Scottish descent, to wit—William Hoper, Philip Livingston, Thomas M'Kean, Thomas Nelson, jun.; George Ross, Edward, Rutledge, James Smith, George Taylor, Matthew Thornton, Jas. Wilson, and John Witherspoon. In the Constitutional Convention, which completed its labours at Philadelphia September 17, 1787. twelve of the members were Scotch, namely, John Blair, Alexander Hamilton, W. Churchill Houston, William Livingston, James M'Clurg, James M'Henry, John Mercer, William Patterson, John Rutledge, Richard Dodds Spight, James Wilson, and Hugh Williamson. Three were Irish, to wit—Pierce Butler, Daniel Carroll, and Thomas Fitzsimmons. When the independent State Governments were formed, after the adoption of the Declaration of Independence, and their Governors were chosen, the Scotch-Irish gave to New York their first Governor, George Clinton, and to Delaware her first Governor, John MacKinley. To Pennsylvania they gave her war Governor, Thomas M'Kane; to New Jersey her war Governor, William Livingston; and to Virginia, Patrick Henry, not only her great war Governor, but the civil leader, who, supported by his Scotch-Irish brethren from the western countries, first carried and then held Virginia for the cause of independence. To North Carolina the Scotch-Irish gave her first Governor, Richard Caswell, and to South Carolina, another great war Governor in the person of John Rutledge. The second Chief Justice of the United States, John Rutledge, was Scotch-Irish, as were also Wilson and Iredell, two of the four original Associate Justices. A third, Blair, was of Scotch origin.

Mr. Hanna also deems it worthy of remark that of the Colonial Governors sent by England to the Colonies before 1776, and of the Provincial Governors from that time to 1789, upwards of forty were of Scottish blood. Of the State Governors from the date last mentioned to 1885 the Scotch or Scotch-Irish gave to Pennsylvania nearly one-half of her Chief Executives; to Virginia nearly one-third; to North Carolina more than a fourth; to South Carolina nearly a third; to Georgia more than one-half; to Alabama more than a fifth; to Mississippi about a fifth; to Louisville more than a fifth; to Texas about a third: to Tennessee nearly one-half; to Kentucky about a third; to Ohio, one-half; to Indiana more than a third; to Illinois nearly a third; and to Missouri about one-half. Among distinguished commanders in the naval war of 1776 or later, the following were of Scottish birth or descent—John Paul Jones, Samuel Nicholson, Richard Dale, Alexander Murray, Charles Stewart, James Barron, John Rogers, sen., John Rogers, jun., Thomas M'Donough, Matthew Galbraith Perry, Oliver Hazard Perry, and Franklin Buchanan. The list of eminent Scotch-Irish or Scotch names among American Generals is too long to reproduce. No less memorable is the part that the Scotch-Irish race has played in American politics. To the Cabinets of Presidents the Scotch and Scotch-Irish have contributed eight Secretaries of State, to wit—Edward Livingston, Louis M'Lane, John Forsyth, John C. Calhoun, Jas. Buchanan, Jeremiah S. Black, James G. Blaine, and John Hay; eleven Secretaries of the Treasury, namely—Alexander Hamilton, George W. Campbell, Alexander J. Dallas, William H. Crawford, Louis M'Lane, Thomas Ewing, Thomas Corwin, James Guthrie, Howell Cobb, Salmon P. Chase and Hugh M'Culloch; twenty Secretaries of War—Henry Knox, James M'Henry, John Armstrong, James Monroe, William H. Crawford, George Graham, John C. Calhoun, James Barbour, Peter B. Porter, John Bell, James M. Porter, George W. Crawford, Jefferson Davis, Simon Cameron, H. S. Grant, James D. Cameron, George W. M'Crary, Alexander Ramsey, Robert Todd Lincoln, and Daniel S. Lamont; seven Secretaries of the Navy, Paul Hamilton, Thomas W. Gilmer, William A. Graham, John P. Kennedy, James C. Dobbin, George M. Robeson, and Nathan W. Goff; five Secretaries of the Interior, Thomas Ewing, Alexander H. H. Stuart, Robert M'Clelland, James Harlan, and Henry M. Teller; four Postmasters-General, John M'Lean, James Campbell, Montgomery Blair, and Frank Hatton; five Attorneys-General, Johun Breckenridge, Felix Grundy, Jeremiah S. Black, James

Speed, and John W. Griggs. Of Speakers of the House of Representatives ten have been of Scotch or Scotch-Irish descent, to wit: John Bell, James H Polk, Robert M. T. Hunter, Howell Cobb, James L. Orr, James G. Blaine, Michael C. Kerr, Samuel J. Randall, John G. Carlisle, and David B. Henderson. More than 89 members of the United States Senate have been of the same race.

In no department of American civil life, however, has the Scottish influence been more marked than in the judiciary. Of the fifty Judges of the United States Supreme Court from 1789 to 1882, no fewer than twenty-one were of Scottish descent—namely: Rutledge, Wilson, Blair, two Johnsons, Patterson, Moore, Livingston, Todd, Thompson, Trimble, M'Lean, Barbour, M'Kinley, Daniel, Nelson, Grier, Campbell, Miller, Davis, and Harlan. We add that Daniel Webster was not of English origin in the paternal line, but came of the Scotch-Irish settlers in New Hampshire.

Using the census of 1790 as a basis on which to apportion the population in 1775, Mr. Hanna estimates that the number of inhabitants of Scottish ancestry at the date last mentioned in the nine colonies south of New England—he thinks there were some twenty-five thousand in New England—was close to 385.000. These were distributed as follows: In New York, 25,000; in New Jersey, 25.000; in Pennsylvania, 100,000; in Delaware, 10.000; in Maryland, 30,000; in Virginia, 75,000; in North Carolina, 65,000; in South Carolina, 45,000; and in Georgia, 10,000. The estimate for Virginia seems low when one compares it with Jefferson's statement that in 1776 a majority of the inhabitants of the Old Dominion were Dissenters. At that time the term Dissenters included chiefly Presbyterians and Baptists. As one-fourth of the total white population of the State was in the upper country west of the mountains, and as that fourth was, almost to a man, of Scottish ancestry, it is, apparently, a safe conclusion that of the whole white population of Virginia, the Scotch-Irish comprised nearly a fourth. Williamson in his history of North Carolina says that the Scottish race was in the Revolutionary period the most numerous in the north-western part of that State, and Ramsey says they were more numerous than any other race in South Carolina. They then comprised nearly the whole of the population of Tennessee, which, at that time, was a part of North Carolina.

SONNET ON A SONNET.

A soft attire of gentle sound; the dress
Of passion mellowed down to sentiment,
And musing sadness. Breathings which express
The poet mind, half disarrayed and bent
On its bright inward mirror; there intent
On some one changeless, almost holy thought,
'Till the pure fire of fantasy, nigh spent,
Leave ere it parts a form of verse unsought—
A word-embodied zephyr—wildly caught
Upon the chords of Fancy. Even as they,
The breezes grow to hearing, and are wrought
To a wild murmuring music, when the gray
Sad twilight tints the west; if spirits finger
Play with invisible touch, and o'er the wind-harp linger.

Medical men all over the world are interested in the reports from Honolulu and Tahiti of successful results obtained in the treatment of leprosy from the active principle of the tua-tua shrub. The tua-tua's scientific name is Jatrapha go ssypifolia, and it comes from Venezuela. Nearly three years ago the Department of Agriculture sent 27 of the tua-tua plants to Dr. Carmichael, United States Marine Hospital Surgeon, then at Honolulu, but now here. The plants were set out in the experiment station grounds in Honolulu, where they flourished, waxed green, and produced many buds. With the plants come statements from Venezuela that leprosy had been successfully treated with the extract.

Old Irish Yeomanry Corps.

By J. EDWARD COOPER.

The authority recently issued to raise two regiments of Irish Yeomanry will probably lend some interest to a brief sketch of the Irish Yeomanry as they existed in earlier days. It is generally known that for a long time neither Yeomanry nor Volunteers have been maintained in Ireland, as it has always been considered that the existence of such corps would not be unattended by risk, owing to the unfortunate extent to which political feeling is so often carried in that country. The step just taken may, however, possibly be the first of many in the same direction.

The first appearance of the spirit of Volunteering apparently was manifested in 1760, when Thurot and a small band of Frenchmen landed at Carrickfergus and took the town. The people around Belfast flew to arms, and the assembly is thus described by Lord Charlemont: "They were drawn up in regular bodies, each with his own chosen officers, and formed in martial array; some few with old firelocks, but the greater number armed with what is called in Scotland the Loughaber axe, a scythe fixed longitudinally to the end of a long pole—a desperate weapon, and one of which they would have made desperate use. Thousands were assembled in a small circuit; but these thousands were so thoroughly impressed with the necessity of regularity, that the town was perfectly undisturbed by tumult, by riot, or even by drunkenness." The expedition ended by the re-embarkation of the greater part of the force; Flobert, and some few of the officers and men were left behind wounded.

The latter period of the eighteenth century saw Ireland in a very disturbed state. Although in 1782, chiefly through the efforts of Grattan, a legislative re-arrangement took place between Great Britain and Ireland, it proved of little or no advantage to the Irish peasantry. Rebellion was seething, outrages were common, and the Government was too weak to successfully cope with the seditious societies known as "Defenders," "White Boys," and the followers of "Captain Right." While matters were in this condition the news of the French Revolution spread over the country.

The line between the Protestants and the Catholics in Ireland, ever very distinct, became even more strongly marked; but, at the same time, there were signs of disunion amongst the Catholics themselves. Those of higher social rank were frequently not averse from a closer connection with England, and seeking the removal of their disabilities by Parliamentary measures, entrusted their interests to a central committee in Dublin. Schoolboys, less erudite than Lord Macaulay's, know how Lord Edward Fitzgerald met General Hoche, and arranged for a French invasion. As Mr. Gillman, vice-president of the Cork Historical and Archaeological Society, writes in a most exhaustive contribution to the journal of that Association, "It then became absolutely necessary for Government to raise a trustworthy force, and this force was the Yeomanry, consisting mostly of Protestants, but containing a good admixture of the other religion also. Their numbers, being all volunteers, soon reached thirty-seven thousand throughout Ireland. Orangemen were strictly excluded by the Lord Lieutenant." There had previously existed a large number of independent companies. These independent corps were raised to meet the recurring threats of invasion, and the oldest regiment of the kind discovered by Mr. MacNevin, who compiled a "History of the Volunteers of 1782," was the Kilkenny Rangers, a cavalry corps, formed in 1777. They marched up to Dublin to attend some great reviews; but the Government of the day, while concealing its fear under the mask of gratitude for the services of the people, trembled at the possible action of an armed nation.

The inhabitants of Athlone, in August, 1796, offered to embody themselves for the defence and protection of their town and neighbourhood, and to oppose the "traitors who excited insurrection, in order to make the descent of an invading enemy more practicable, and to take advantage of the naked and defenceless state of the kingdom if the Regular troops were drawn off." In the following month the Government determined to "embody a certain number of cavalry and infantry in each county, to preserve the peace while the Army and Militia were engaged in protecting the coast against invasion." Amongst the regulations imposed by the Government were that every member should take the oath of allegiance to the King, should drill at specified times, and should, to the best of his ability, endeavour to suppress riot in his own and the adjacent barony. It was further stated that if any corps should volunterr to serve with the Regular troops, it should be under the Mutiny Act. Throughout the country corps of Yeomanry cavalry were largely raised. The majority of the members were drawn from the country gentlemen, who were frequently small landowners—a class proportionately far more numerous in Ireland, as in Scotland, than in England. The titles of some of these regiments are rather quaint. In MacNevin's History a list of the names of corps is given. Amongst them may be found the Aghavoe Loyals, the Tallow Blues, the Arran Phalanx, the Imokilly Blue Horse, the Kilcooly True Blues, the Castlecomer Hunters, the Glorious Memory Battalion, and the Independent Enniskilleners. Most of these regiments seemingly indulged in passably gorgeous uniforms. That of the Bandon Cavalry is thus described—"Dark olive green jacket, half lapelled, crimson velvet cuffs and collar, silver epaulettes"; that of the Doneraile Rangers Light Dragoons as "scarlet, faced green, edged white, gold epaulettes, yellow buttons, and helmets, green jackets, faced red." The Volunteer Cavalry, or Yeomanry, were formed in the country districts. Nearly all the Volunteer Infantry were raised in the larger cities.

As a representative example some details of the "Muskerry Legion of Yeomanry Cavalry" may now be given. The writer has selected the corps, as he believes it to be quite typical of most of the Irish Yeomanry regiments of the time.

In a letter dated from Dublin Castle, 10th September, 1803, the establishment of the First Troop was fixed as follows—1 permanent sergeant, 2 sergeants, 1 trumpeter or drummer, and 60 mounted men. Many of the troops, however, had been admitted long before the date of this authority from the Lord Lieutenant. As a result of the Government Proclamation in 1796, to which reference has already been made the following public advertisement was circulated—"The gentlemen of the baronies of East and West Muskerry are requested to meet at the Courthouse in Marcromp,* on Monday, October 24, inst., for the purpose of embodying themselves, under the sanction of the Government, to preserve the present tranquility of the country. October 17, 1796." The meeting was held. "Gentleman and farmers" of all denominations were present, and the following resolutions were passed—"That we will form ourselves into an armed corps of Cavalry, for the protection of persons and property in our baronies, under officers chosen from among

*Macroom, Co. Cork.

our body, and to be approved of by Government. That we will serve without pay and provide our own clothing; but we will receive arms, ammunition, and accoutrements from Government. That we will obey the orders of our officers, as long as we shall each of us chuse to continue members of the corps. That Augustus Warren, Esq., be appointed captain; Samuel Swete, Esq, lieutenant; and George Rye, Esq., Cornet." Portions of the Orderly Book of the First Troop are still preserved. The volume contains a list of the members and the dates of their enrolment, and a record of each day's work till February 24, 1806, when it abruptly ends. The duties the members were called upon to perform consisted chiefly in patrolling the country at night, bringing law-breakers to justice and carrying dispatches; they also underwent daily exercise in drill. When General Myers relinquished the command of the South-West District he addressed the Muskerry Legion and Yeomanry as follows:—"In leaving the important command of this district, I felt great satisfaction in conveying to the Yeomanry the high sense I entertain of their exertions, improvement, and discipline, actuated, as they have been, by the noblest of motives—the protection of their Sovereign and the defence of their country from foreign and internal enemies. In such a cause a corps of men so determined must be successful should the enemy attempt their shores. It is needless to call to their recollection that on this side of Heaven there is but one United Kingdom of liberty and independence. This is the trust committed to their charge; this is the motive which has called them to the field." The monthly inspection used to take place at Carrigadrohid. A letter dated June 1, 1805, ordering the parade is not without its humorous side. It runs:—"Lieutenant-Colonel Morrison's compliments to Captain Comt. Warren, and begs he will have the goodness to have the Muskerry Legion, under his command, under arms at Carrigadrohid, at 12 o'clock on Wednesday, the 12th of June, for his monthly inspection, and to fire three rounds of blank cartridge per man, which will be obtained in Cork by applying to the Adjutant-General." The exact date of the disbandment of the corps is not known. It is certain, however, that it was re-embodied in 1822, and the Orderly Book, headed "Orderly Book of the Muskerry Association," of this period is still preserved in the Warrens Court Family. In this volume are included the Orders and Regulations to be observed by the Musketry Association in Leemount Barracks; they are thus detailed: "Ordered—That a guard of two men be put on duty at ten o'clock every morning, and not be relieved until next morning. That they always appear in full uniform. That they do not, on any pretence whatever, go to bed or quit their guard, and that during the day one of the Guard be placed as centinel outside the hall door. That all arms be excluded from the mess room, except four carabines for the use of the guard. That no man leave the barrack either in the day time or night without permission of the commanding officer, and any member so absenting himself shall be fined half-a-crown. That all fines be paid to the Secretary, to be applied by him to the use of the Mess Fund. That the guard for night duty get their supper, one pint of beer and two glasses spirits to make punch, and that Corporal Gollock is ordered not on any account to exceed the above allowance." Regarding this last amusing and ambiguous order, the Vice-President of the Cork Historical Society, to whom allusion has before been made, remarks that "it appears not to imply an estoppel on the corporal personally.

The "Rules and regulations to be observed by the Mess of the Muskerry Association" indicate that the members made ample provision for both external and internal comfort. It was ruled that each member on coming into barracks deposited one guinea with the Secretary, and sent into barracks one gallon of whiskey, two cribs of turf, or one barrel of coal. In 1827 there are some entries relating to disputes between members, and a copy of a letter signed by over thirty members written to another member who was in trouble about a duel in which he had been engaged. The corps was disbanded in the same year. Stories are still told of the practical jokes and lively proceedings at night, in which, needless to say, the whiskey played a prominent part. Most of these anecdotes, however, can hardly be deemed profitable. During the agitation for the Repeal of the Union in 1843-1844, the corps was again called together by Sir Augustus Warren, but was never actually re-embodied.

OLD IRISH PROVERBS.

It is now asserted that the ancient kings, Brehons and Fileas of the Milesian Irish, were men of great intelligence and wisdom, and that the sayings of "Allamh-foahla," Fethil the Wise, Moran, and Cormac MacArt were so many terse lessons of human wisdom; but it may be information to the majority of the Irish public of the present day to state that many of our proverbs in present use are nearly paraphrases of the old Milesian sayings. Annexed we give a list of genuine Irish proverbs, principally translated, and literally from Hardiman's Irish Minstrelsy, which will show the similarity between them and modern English proverbs:—

The rare jewel is the most beautiful.
A blind man is no judge of colours.
When the cat is out the mice dance.
When the old hag is in danger she must run.
Even a fool has luck.
A mouth of ivy, a heart of holly.
The historian's food is truth.
Fierceness is often hidden under beauty.
There is anger in a laugh.
Fame is more lasting than life.
A foolish word is folly.
The church that has no music is poor indeed.
Lay up in time.
Mild to the meek.
Cat after kind.
Force overcomes justice.
Hope consoles the persecuted.
The satiated forget the hungry.
Long sleep renders a child inert.
Hurry without haste.
Drunkenness is the brother of robbery.
Hope is the physician of every misery.
It is difficult to tame the proud.
Idleness is the desire of a fool.
Look before you leap.
Gold is light with a fool.
The end of a feast is better than the beginning of a quarrel.
A wren in the hand is better than a crane out of it.
He who is out, his supper cools.
The memory of an old child is long.
Everything is revealed by time.
A cat can look at a king.
Patience is the cure of an inveterate disease.
Learning is the desire of the wise.
Character is better than wealth.
Without treasure, without friends.
A hungry man is angry.
No man is wise at all times.
—Every dear article is woman's desire.
Wisdom exceeds strength.
Wine is sweet; to pay for it bitter.
Sleep is the image of death.
Enough is a feast.
Present good is better than past good.
Satire wounds a great character.
Death is the physician of the poor.
Every flatterer is not a friend.
There is no nobility without virtue.
Never too old to learn wisdom.
There is no one without fault.
Gold is the idol of the covetous.
The weather is bad which is not good for some person.
An ignorant king is a crowned ass.
Wisdom exceeds riches.
An empty vessel makes most noise.
Wine pours out the truth.
Sunshine follows rain.
From education comes conduct.
A good beginning is half the work.
Wine to-day; water to-morrow.

It will be seen from these literal translations the extent to which many commonly used English proverbs owe their origin to the ancient Irish.

TAKING OF THE EARL OF ORMONDE, APRIL 10, 1610.

The following account of the event depicted in the engraving on opposite page is from Leland's "History of Ireland" (Dublin, 1773):—

On the departure of Sir George Carew for his government of Munster, he was received at Kilkenny by the earl of Ormond, who informed him that he was the next morning to hold a parley with O'Moore, the principal rebel of Leinster; inviting him and the earl of Thomond, his companion, to attend the conference. They complied, advising the earl that his own troop of two hundred horse, joined by that of one hundred, which was in the president's train, should attend them as a guard. Ormond slightly answered that the precaution was unnecessary, and even commanded his own troop to halt within two miles of the appointed place of meeting, advancing only with seventeen armed men; while O'Moore awaited him with a complete band of pike-men, leaving his chief body, consisting of five hundred foot and twenty horse, in an adjacent wood, ready to rush out at his command. Carew, who disliked the situation of the place, the circumstances, and the behaviour of the enemy, pressed the earl of Ormond to retire: but after a long and fruitless conference with O'Moore, he demanded to speak with one Archer, a jesuit, noted as a great incendiary. While he was engaged with him, the rebel troop gradually advanced, surrounded his company, and at length seized the earl. Carew and Thomond spurred forward, and burst through them, so as to effect their escape with some danger and difficulty. Ormond remained their prisoner; nor could his troop be persuaded to attempt the rescue of their lord.

In Webb's "Compendium of Irish Biography," the following account is given of the career of the Earl of Ormond:—

Butler, Thomas, 10th Earl of Ormond, Earl of Ossory, surnamed the "Black Earl," born about 1532, was but fourteen at his father's death. He was brought up at the English court with Edward VI., who took delight in his company. Serving as a volunteer under the Duke of Somerset in Scotland, he distinguished himself by his bravery at the battle of Musselborough. In Queen Mary's reign he was made captain of a troop of horse, and gave distinguished proofs of fidelity and courage in the suppression of Wyatt's rebellion. In 1554 he entered into possession of his estates; and within the next three years more than once marched under the Lord Lieutenant against the Scots in Ulster. Soon afterwards he relieved the Earl of Thomond, besieged by the native septs at Bunratty. He stood high in the good graces of Queen Elizabeth, who made him Lord Treasurer, and added to his estates out of the confiscated church lands. In 1564 and 1565 Munster was wasted in conflicts between him and the Earl of Des-

TAKING OF THE EARL OF ORMONDE.

From an Ancient MS. in the Library of Trinity College.

mond. Ultimately Desmond and Sir John of Desmond were sent over to London and imprisoned; whereupon several of the southern chieftains, aided by the Earl of Ormond's brothers, Sir Edmund and Sir Pierce Butler, took the field against the Government. Ormond, in England at the time, was sent over to help to quell the insurrection. He landed at Waterford, 14th August, 1569, and hastened to join the Lord-Deputy at Limerick. There his two brothers submitted, and were pardoned. In consequence of the Desmond insurrection, he was, in 1578, made governor of Munster; and in 1580, in conjunction with Lord Justice Pelham, made an expedition into Desmond. Carrigfoyle, Askeaton, and other fortresses were taken, and their garrisons put to the sword. In 1581 the Baron of Lixnaw, one of Desmond's chief followers, submitted to the Earl of Ormond, who interceded for and obtained his pardon. In 1583 he obtained supplies of men, money, and ammunition from England, and made a determined effort to capture the Earl of Desmond, to this end carrying on a war of plunder and devastation in Munster. Within the space of a few months he cut off, of Desmond's party, "46 captains, 800 notorious traitors, and 4,000 common soldiers." Before long nearly all the great lords of the south submitted to him at Cork, and the Earl of Desmond was left a wanderer with but a few companions. It is much to Ormond's credit that he positively refused to accede to Burleigh's directions that he should disregard the protections he had accorded to the native chiefs. He wrote: "I will never use treachery to any man, for it will both touch Her Highness's honour and my own credit too much; and whosoever gave the Queen advice thus to write, is fitter to execute such base service than I am." The wars that desolated Munster were at length ended by the capture and death of the Earl of Desmond (11th November, 1583). In the ensuing confiscations, Ormond was given 3,000 acres in Tipperary and a "great tract of poor land" in Kerry—less than he considered his fair share after the part he had taken on the Queen's side in the war. In the operations against O'Neill, he commanded in different parts of the country. On 10th April, 1600, he accompanied Sir George Carew and the Earl of Thomond to a parley near Kilkenny with Owney O'More. The parley resolved itself into a skirmish. Ormond was taken prisoner—Sir George and Thomond escaping with difficulty. At the instance of O'Neill, the Earl was released in June, giving Owney hostages for the payment of £3,000, should he thereafter seek revenge for the treacherous injuries he had received. After Elizabeth's death, he was confirmed in his office of Lieutenant General by King James. He was blind the last twelve years of his life, and died at his house at Carrick, 22nd November, 1614, and was buried at St. Canice's. Carte styles him "a man of very great parts, admirable judgment, great experience, and a prodigious memory; . . . very comely and graceful, . . . of a black complexion, which gave occasion to the Queen (in her way of expressing kindness to such as she favoured) to call him her 'black husband.' This favour doubtless occasioned the undying hostility between him and the Earl of Leicester, whose ears he on one occasion boxed, and was therefor sent to the Tower. He repaired and beautified Kilkenny Castle, built an hospital at Kilkenny, and castles at Holycross and elsewhere. Thrice married, he left no heir. This Earl was a Protestant.

CHAUNT OF THE NEREIDS.

Egle:

We love the lonely shore,
The craggy rock and sandy reach,
The ocean's laugh or roar::
Or stealthy step upon the beach,
And the cry o'er the foam
That comes from sea-birds home,
But securely many a league away
On the shelving strand of some circling bay.

Pione:

Us do the Zephyrs love,
They court us on the heaving sea,
And tender seek to move
By sweet odors borne from that lea,
Where mild Nepenthe grows,
Entwining with the Rose—
Ah, no, ye Zephyrs! in Lemnian Isle,
Too well you learned the fickle lovers guile.

Eunice:

When'er the light winds rest,
When ev'ry wave doth silent bide
In ocean's glossy breast;
Softly we dance in compass wide,
Sport on the silvered flow,
Sport in chaste Cynthia's glow—
Now each motion gentle now fast the race,
As breathe we low voices, and words of grace.

Evagora:

The fierceness of the storm,
The quiv'ring lightnings sharp red glare
And keenly jagged form,
Silently gliding thro' the air;
Right joyously we court,
And mid the billows sport,
And gaily still do we dance ever more,
While the thunders roll and the tempests roar.

Agava:

It's a joy to our eye,
The flash of the billowy strife,
The spray leaping on high
Like with the glad being of life,
And a dearer joy to hear,
The sound of waters near,
And like the laugh of joy, or wail of grief,
The roar of the surf on the rocky reef.

Arethusa:

Right joyously we glide,
Ever the warring waves among,
And the billows we ride,
Chasing their sparkling crests along,
We wreathed with the vine,
That grows in ocean's brine;
And decked with feathers bright with glancing gloss,
Just dropped down white from wing of Albatross.

Eurydice:

Each air from the inland
Wafts incense from sweet sacrifice,
And altars on the strand;
And sailors gift so dainty nice,
For sailors bark we care,
And sailors bark we bear,
For sailors barque we care,
And sailors barque we bear,
To where he will, or port in Grecia's seas,
Or Tuscan harbour, safe from ev'ry breeze.

All:

The great ocean's our home,
And ne'er does its anger hurt us;
And the ocean we roam,
For the ocean fondly loves us,
And most kindly to bless,
With kiss and dear caress,
Soft and warm around us it leaps, it glances,
And gaily in purple and azure dances.

W.R.M.

OLD JERRY'S WEALTH.

By ETHEL GODDARD.

Old half-blind Jerry had begged all day; truly there were but few passers-by from whom the destitute might solicit alms, but the mendicant intention in old Jerry's case was nevertheless the same.

Darkness was falling over the long, dusty road by which he sat. Nobody had given him aught through that long, weary day, and he told himself bitterly that to trudge to the big town, distant two miles, in his present bankrupt state, would, indeed, be labour in vain; for Jerry had, in his fourscore years of experience, lost entirely his primitive faith in the charity of mankind. Sitting there by the dusty road, in the failing light, Jerry felt lonely, hungry, and cold; he longed exceedingly for a hot meal and a bed.

In his youth he had been somewhat socialistically inclined; had seen golden visions of the whole world living in artisans' dwellings, and having the same plain sufficiency of dinner; but those thoughts had never become materialised in Jerry's day, and he felt a bitter certainty that he should in the end go to a pauper's grave for lack of food.

The grating sound of approaching wheels smote on his ear, and Jerry stood up feebly, hat in hand, hoping against hope for the advent of charitable folk, blessed with small change. The car held a party of young fellows returning from a day's shooting. Jerry had usually found them quite unmerciful, but he tremblingly held out his hat all the same.

"A trifle, good young gentlemen; a trifle," he piped in his worn old voice, looking piteously at the four merry youths who were returning, he knew, to a good meal and the comforts of bed.

"Here, old boy!" cried one of the boys. "Here, catch!"

There was a glint of silver in the dust, a rapid whirl of cart wheels, and the happy crew disappeared, leaving old Jerry to search in the dust for the coin which meant bread and meat to him.

"It was just here," he muttered, peering with his dim old eyes at the white dust, but no coin was to be seen.

He knelt on the ground, clawing up the dust in handfuls, often tearing his crooked old hands against the stones of the road.

"Mother o' God," he muttered. "Mother o' God pray for me."

There he knelt, a piteous figure bowed to the ground, the darkness falling slowly round him, hiding his chance of food and lodging.

"Holy Mary, Mother o' God!"—the feeble, querulous voice sounded strange in the lonely place—"help me; I'm sturvin' with the hunger."

Black night came on as he clawed at the dust and prayed; the wind sighed, and the raindrops, longed for by the farmers, fell heavily. They sank through old Jerry's rags, and the wind ran playfully through the holes in his garments.

Till midnight he knelt, clawing, searching with the eye of faith, his face working convulsively. The big bell boomed over the lonely road; it was the bell of the town church—the town where he might have slept that night.

"Mother o' God," he sobbed. "Our Father who art—— Ah!"

His hand had touched a coin; he felt its kindly smoothening.

"Glory be——"

The voice broke, something gripped old Jerry's heart, and forward on the white road fell a lifeless mass—an old man with his wealth in his hand.

THE INFLUENCE OF MUSIC.

THE HISTORY AND ANTIQUITIES

OF THE

CITY OF DUBLIN.

FROM THE EARLIEST ACCOUNTS:

Compiled from Authentick Memoirs, Offices of Record, Manufcript Collections, and other Unexceptionable Vouchers,

By THE LATE WALTER HARRIS, ESQ. WITH AN APPENDIX.

Chapter III.

Of the Ancient Walls, Castles, and Towers of the City of Dublin.

That the walls and fortifications about Dublin were raised by the Ostmen or Danes in the 9th century, is a point that admits of no controversy; historians are uniform upon this head, though none of them are so particular as to fix an area for the first erection. As it was the head and capital of their colonies in Leinster, from whence they issued out upon all occasions against their enemies, it is no way improbable but that they rendered it fit for defence and security soon after they first possessed it, which seems to have been about the year 838, when we are told (a) "that a fleet of sixty sail of those foreigners entered the river Liffey, and another of the same number possessed themselves of the mouth of the river Boyn at Drogheda." Ware (b), indeed, from the authority of some Irish histories, takes it for granted "that the Danes possessed themselves of the city of Dublin, and of the neighbouring territory called Fingal, before the year 851." He might have fixed that event to an earlier period; for it is manifest, from the annals of Ulster, "that in the year 843 Nuad Mac-Segene, a religious of Kil-Achad, suffered martyrdom from the Danes of Dublin, who also pillaged the church of Kil-Achad." As therefore we find them settled at Dublin in this last mentioned year, it is no way improbable that they possessed themselves of it five years earlier, when their great fleet first appeared in the mouth of the Liffey.

In the year 1000 the same people repaired (c) and fortified the city with new works, and five years after king Melaghlin marched to Dublin, and set fire to the suburbs; but the strength of the walls hindered him from making any impression on the city. An eye-witness (d) tells us, "that when Earl Strongbow first laid siege to Dublin in the year 1170, Miles de Cogan lodged close to the walls," and he mentions also St. Mary's-gate, on the east part of the city, and the south gate, and that the kerne were mounted on the walls. Cambrensis (e) who was contemporary with these actions, gives also the same account; from all which it is evident that the city was encompassed with walls before the arrival of the English; and it may be seen in a preceding chapter that in the writ sent by king John to the lord justice Fitz-Henry in 1204, for building the castle, he commanded him to compel the citizens to strengthen and repair the city walls, the fortifications about the city having then, it seems, gone in some measure to decay.

In the annals of Ireland published by Camden at the end of his Britannia, ascribed by some (a) to Philip Flatisbury, but by others (b), more truly, to Christopher Pembrige, it is said, "that the church of the dominicans (c) was in the year 1310 destroyed by the mayor and citizens of Dublin, when they expected to be besieged by Edward Bruce, and the stones converted to the building of the city walls, which were then enlarged on the north part above the Merchants-quay; for that formerly the walls ran by the church of St. Owen, where (proceeds Pembrige) we still see a tower beyond the gate, with another gate in the street where the taverns are," i.e., in Winetavern-street. From this description given by Pembrige, some judgment may be formed how the ancient walls of the city were carried, namely, from Winetavern-gate along the south side of Cook-street, till they joined Owen's-arch, which yet remains, and was a portal to the city, and from thence were continued north of Owen's church-yard to a castle called Fagan's-castle, in Page's-court, where was another portal, and from thence they extended to New-gate. Some remains of these ancient walls may be seen in a void plot of ground lying between Schoolhouse-lane and Owen's-arch; the residue of them being for the most part built on, and the traces and evidences thereof entirely changed, must be judged of by the description given by Pembrige before mentioned, which was given, if not by a contemporary witness, at least by one who wrote a very few years after. For that writer closes his annals with the year 1347, at which time he probably died; and we rather choose to follow his testimony than that of Richard Stanihurst (d), a writer of the sixteenth century, who inverts the order of the story, and would have the new wall erected at the time of Bruce's invasion to be the inner wall before described, "for that (says he) the citizens mistrusted that the walls that went along both the quays (i.e., the Merchants-quay and Wood-quay) should not have been of sufficient force to out-hold the enemy."

The walls of the city, including those of the castle, in their largest extent did not take up an Irish mile. We shall endeavour to trace them out, as far as the ruins of time and the penury of writers will suffer; and as some parts of them in several places are yet visible, we shall connect them together, partly by probable conjecture, and partly by such memoirs as have occurred.

From the North or Store-tower of the castle, formerly mentioned, the city wall was carried by the garden of Cork-house, which was anciently the church-yard of St. Mary les Dames, unto Dame's-gate, which stood upon the rising of Cork-hill, opposite to a small alley, called by some Scarlet-alley, and by some Salutation-alley. It is to be noted, by the way, that the street now called Cork-hill, is no ancient name of the place, but was affixed to it only in the last century, from a house erected there by the first earl of Cork, in which now is kept Lucas's coffee-house, the Old Exchange, and some other tenements inhabited by tradesmen. The proof of this particular may in some measure be collected from a grant of the ground on which those buildings stand, to the said earl of Cork, now to be seen in his majesty's Rolls-office, passed in the reign of king Charles I., though enrolled in the 28th of Charles II. among other grants made to that nobleman by queen Elizabeth, king James I., and king Charles I. The grant is "of one piece of land with the appurtenances, situate near the castle ditch of Dublin, late in the tenure of Jaques Wingfield, extending from the wall on the north part of the said castle, in breadth an hundred feet, and from the bridge of the said castle in length to the wall of the city of Dublin, adjoining to a certain tower of the said castle (which must be the store-tower) towards the east one hundred and fifty feet. Also the whole piece now or late void ground lying near the east and north wall of Dublin, extending from the castle called Fynan's-castle, and so near the wall, from the wall of the said city on the west, unto a garden late in the tenure of William Grace or Patrick Kelly, or one of them, and the orchard called Fagan's orchard, and so along by the mears of the said orchard unto the Hogg-lane on the east, and from the river Aneliffe on the north unto the walls of the said city, and the king's way called Dame-street, on the south and west, together with the ground, soil, and bottom, and other appurtenances of and in the limits aforesaid in the county of the city of Dublin. Also a tenement late covered with thatch, and two gardens adjoining, in the parish of St. Andrew's, without the Dame's-gate, within or near to the said city in the county of the city of Dublin, late parcel of St. Mary's-abbey near Dublin." We have given this part of the record at large, though it does not all properly

belong to the subject of the present chapter; yet we thought it necessary in regard it shows how much the city is increased in buildings and improvements, even since the reign of king Charles I., when gardens and void spaces of ground, and thatched houses were to be seen even within the narrow compass of the walls. To proceed:

Dame's-gate, anciently called the eastern gate, and St. Mary's-gate, and so mentioned by Maurice Regan, did not take its name from the mill-dam near it, as some have conjectured, but from the church of St. Mary les Dames, contiguous to it on the inside of the walls; and till the reformation (a) the image of the Virgin Mary stood in a nich of stone work over the gate; the pedestal and other footsteps whereof remained there till the gate itself was demolished within our own memory. From this gate the street called Dame's-street derives its name, extending in a line from east to west to Hoggin-green. This gate was built with towers castle-wise, and was armed with a port-cullis. It was one of the narrowest entrances into the city, and standing upon an ascent was, when business increased, and the town grew more populous, much thronged and encumbered with carriages; for remedy whereof the earl of Strafford attempted (b) to have the passage enlarged by throwing down a part of the city wall, and some houses adjoining thereto; but the neighbouring proprietors could not be prevailed on to yield their consents upon the terms proposed, and the project came to nothing. At this time the places, where now Crane-lane, Essex-street, the Custom-house, Temple-bar, and Fleet-street are built, were a strand and slough, and there was a small harbour near the foot of Dame's-gate, from whence archbishop Alan in 1534 (c) took boat, intending to fly to England to avoid the fury of Thomas Fitzgerald, who had that year broken out into rebellion, and was a great enemy to the archbishop (d). This slough was reclaimed, and the river embanked with quays in the reign of king Charles II. (e), and the council-chamber and other structures being built there, it was thought necessary by the government, in regard the incumbrances daily increased by the growth of trade, to make another aperture in the city wall, which was done in the government of Arthur, earl of Essex, in 1675, by demolishing Isods-tower, and in the room of it erecting a new gate, which then got the denomination of Essex-gate, as the new street leading from it, and the bridge soon after laid over the Liffey, were called Essex-street and Essex-bridge, in honour of that lord lieutenant. Mr. Humphry Jervis (who was afterwards knighted, and served in the office of lord mayor in 1681) was one of the sheriffs of the city when these works were undertaken, and promoted them with great zeal and activity, perhaps not without an eye to private interest, as he had a considerable leasehold estate on the north side of the river, and the event has shown that he was not mistaken in his reckoning. Essex-gate, at that time erected, has since been demolished.

The tower before mentioned under the name of Isod's-tower, together with Chapelizod, a village near the city (and the same may be said of Isod's-fort in the park) are reported by an historian (a) "to have taken their names from La-Beal-Isoud, or the fair Isoud, daughter to Anguish (I know not what), king of Ireland, and that the tower was a castle of pleasure for the kings to recreate themselves in." But perhaps it would be nearer the truth to conjecture that these places were so called from the surname of Isod, some of whom yet remain in the county of Kilkenny.

Between Dame's-gate and Isod's-tower stood another (b) tower (now covered with a private edifice).

From Isod's-tower the wall extended N.N.W. till it joined Newman's-tower, by some (c) called Buttevant's-tower on the banks of the river, a little west of the place where Essex-bridge now stands; and from thence at no great distance it was annexed to another tower anciently called (d) Cafe's-tower, but in latter times the Baker's-tower, the same having been long held as the Baker's-hall.

From Cafe's-tower westward on the walls of the city, at the end of Fishamble-street stood a castle, that in different ages bore two names, viz., Proudfort's-castle, and Fyan's-castle, possibly from some families of both those names, who either built or inhabited it. William Proudforte was a man of some figure in the reign of Edward III., and was appointed one of the commissioners (e) for levying a subsidy granted by the communities of the counties of Cork, Limerick, Tipperary, and Kerry, to Almarick de Sancto Amando, lord justice, for carrying on the war against the Irish enemies an. 1358. Three of the Fyan's bore (f) the high offices of the city in the 15th and 16th centuries. For John Fyan was mayor in 1472 and 1479. Thomas Fyan was one of the sheriffs in 1540, and Richard Fyan was mayor in 1549 and 1564. It must be submitted to conjecture, whether the Proudfort or the Fyans before mentioned gave their respective names to this castle, by the latter of which names it was called (g) in the year 1610, and by the former in 1678 (h), and was sometimes used as a state prison.

The Old Crane, a strong building, and for a time used as a custom-house, stood near the city walls between the Wood-quay and Merchant's-quay, at the end of Winetavern-street, but seems to have been more modern than the towers and castles before mentioned, and to have been erected for other purposes than defence. Part of this building remained till of late; and from thence the wall made in the time of Edward Bruce's attempt, stretched in a direct line along Merchant's-quay, till it joined the Bridge-gate, standing on the south side of the Old-bridge, which gave name to one of the most ancient streets in the city, called from thence Bridge-street, and afforded also another inlet into the city. This gate was not coeval with the bridge, which was built in the reign of king John, but was erected in the year 1316 against Bruce's attempt. It was placed between two turrets, furnished with a port-cullis, and ornamented with a public clock (a) for regulating the motions of market people homewards, which was set up in the year 1573, and seems to have been done from observations made on the conveniences which three public clocks (b) set up in the year 1560 by Q. Elizabeth, afforded the citizens; namely, one at the castle, one in the city, and a third at St. Patrick's church. This gate, having through age suffered great decays, was repaired (c) at considerable expense by that glorious queen; and at the same time her royal arms were erected at the north side thereof, fronting Oxmantown, and an inscription fixed thereon bearing date MDXCVIII.

From this gate the wall was continued on the west side of Bridge-street to another gate which stood between the south end of the said street and the lower end of New-row, near a place called by Stanihurst (d) the Cucull or Cuckold's-post. This gate supported (e) with an arch a castle without turrets, and hath passed under three several names. Some (f) have called it Gormund-gate, from one Gormund, a Dane, who they suppose was the builder of it, and others (g) from Gormund, a Danish saint. But neither of these hypothesis can be well supported; since the gate gave an entrance into the city, through that part of the wall which was built in 1316 (h) during the invasion of Edward Bruce, long after the extinction of the Danish power here. Others, with more probability, have called it Ormond, or Urmond-gate; and this also is a conjecture of Stani-

(h) Anno 1316 the city walls on the north ran close by St Owen's church and Winetavern street; in which places were two gates (described in Camden's Irish Annals), and by the stones of St Saviours, the friers predicants church; the Mayor and citizens enlarged and built a new wall to the city from Newgate (from thence so called) to Ormond's-gate, which stood at the foot of King John's bridge.

hurst (a), who adds that it took the name from some earl of Ormond, who issued out of it and defeated a body of Irish who were approaching to assault the city, and that in memory of the action, the gate was from thence so called; and this indeed seems to be countenanced by the name which the place at this day bears, being called in Irish "Geata na Eorlagh," or the Earls-gate. The place where it stood is now called Wormwood-gate. From Ormond-gate the wall stretched up a steep hill to Newgate; but between both stood a square tower within the verge of the marshalsea of the four courts, commonly called the Black-dog (b), from the sign of a Talbot there hung up. This tower was till towards the end of the 17th century called Brown's-castle, not in regard of any ancient founder, but of a later proprietor, Sir Richard Browne, who kept his mayoralty therein in the years 1614, 1615, and 1620. Newgate was anciently, and still is, made use of for the custody of the worst sort of criminals. It was built in a square form, and had a tower at each corner; but upon the reparation of it in the time of the usurpation (c), the two towers that looked towards the city were taken down, the other two next to Cut-purse-row are still remaining. It has been repaired and altered not many years since, and a commodious passage for foot people laid out on the south side of it. Whether it was called Newgate, as being the last built of the city gates, or from Newgate in London, must be left uncertain; but it appears from undoubted records to have borne that name upwards of five hundred years, of which the foundation charter of the hospital of St. John without Newgate, made by Alured le Palmer about the year 1188, and the confirmation thereof by Pope Clement III., are pregnant evidences. It appears also by a record (d) in the tower of London, that one Daniel, prior of the hospital of St. John without Newgate, obtained the royal assent to the bishopric of Emly on the 8th of April, 1233; though the see being at that time filled by one Christian, Daniel came short of his expectation. Among the plea-rolls in Birmingham-tower (e) there is an instance also that comes near the point, where Walter, prior of St. John's without Newgate, recovered by fine against Richard Bretnagh, the lands of Coulkoyl in the county of Limerick, before the justices itinerant at Limerick in trinity term, 35 Hen. III., i.e., 1251.

A good part of the old walls of the city is to be seen at the Market that nearly adjoins to Newgate.

From Newgate the wall was carried S.E. along the rere of Back-lane to another aperture in St. Nicholas-gate, and in this extension supported three towers, the first of which was called the watch-tower (f), placed near Newgate, where ordinarily a centry stood heretofore to guard the prisoners therein confined, from which circumstance it got its name. The second tower was in shape octangular, but was usually called the Hanging-tower, from a propension or leaning posture it had towards the suburbs. The third of these towers stood between the Hanging-tower and St. Nicholas's-gate, and was called sometimes the Round-tower, from its figure, and sometimes St. Francis's-tower, from its position opposite to the garden of the Franciscan friary, which is now all covered with buildings.

From St. Nicholas gate the bounds of the city began to be contracted, and the walls were carried N.E. at the back of a mill-race in Bride's-alley, where a proportion of them is yet to be seen on the south side of Ross-lane, till they extended to another opening at Pole-gate, or rather Pool-gate, from a confluence of water which settled in this hollow, and was often troublesome to passengers, till a bridge was thrown over it, which was repaired (a) by Nicholas Stanihurst about the year 1544. In latter times this gate has been called St. Werburgh's-gate, in regard to its situation at the south end of a street of that name, dividing the same from Bride's-street or St. Bridget's-street. In equal distance between Nicholas-gate and Pole-gate stood anciently a tower called Geneville's-tower (b), near adjoining to a building called after the tower, Geneville's-inn, both which are supposed to have borrowed their names from Sir Henry Geneville, whose property they were, and whose wife, Maud Lacy, died in Dublin in the year 1302.

From Pole-gate the wall proceeded in pretty near a straight line till it terminated with the castle at Birmingham-tower, a little beyond a small tower which stood on the city wall, in the room of which was afterwards erected (c) a little building projecting out of Hoey's-alley; and here a good part of the city wall is yet to be seen. Anciently there was a small gate hereabouts, that gave an entrance into the city from Sheep-street to Castle-street, called St. Austin's-gate, not (as some have imagined) (d) as it opened a passage to a monastery of Augustin-friars, which, to support their notion, they mistakingly place in Castle-street. For that religious house did not lie within the city, but without the walls northward of Dame's-street, almost opposite to the end of George's-lane, where some footsteps of the ruins of it were lately to be seen at the bottom of Crow-street; and it appears also by a fiat (e) in the Rolls-office, that the site and possessions of this friary lying near the city, were granted to Walter Tyrrel to hold in fee by knight's service, and six shillings and a penny rent; the heirs of which Tyrrel assigned them to Nicholas Viscount Netterville, by whom they were assigned to William Crow, whose family (for what we know) enjoy them to this day. But this gate took the name of Austin's gate, either as it was dedicated to that saint, or, as it afforded a passage to the friars of that order to attend the citizens in their nightly confessions and other duties, when the principal gates of the city were kept close shut and guarded. Before the building of the castle, the wall of the city ran up short of the same, and to the west of it, until it joined Dame's-gate; and much of the foundation of the old walls has been from time to time discovered in digging the earth for laying the foundations of buildings in that tract.

Having thus surrounded the city, and traced the ancient fortifications of it, we shall close the account with an act of parliament (a) passed in the 14th year of king Edward IV., wherein it is recited "That king Henry VI. had on the 6th of February in the 33rd year of his reign granted to four citizens of Dublin six pounds out of the fee farm rent of the city for forty years for the reparation of the walls and gates thereof, and that king Edward IV. on the 23rd of June in the 4th year of his reign, had granted to four other citizens twenty marks for forty years out of the said fee farm for the same purposes, and all the said citizens being dead, it was enacted that the mayor, bailiffs, and citizens should have and retain annually in their hands the said six pounds, and twenty marks during the remaining years, to be employed on the walls and gates of the city. Provided the said act be not prejudicial to Thomas Kelly, prior of the dominicans of Dublin, as to ten marks granted to him for life out of the said fee farm."

IN COUNTRY LANES.

O Country lanes, white-starred with bloom,
Where wild things nestle, shy and sweet,
Where all your waving grasses laugh
And part before my eager feet—

Could I forever dwell with you,
Letting the mad old world rush by,
And just be glad of wind and sun,
Of rocking nest and brooding sky!

How often, in the crowded streets,
I dream of you, sweet country lane,
And feel once more your soft breeze soothe
My sordid breast and weary brain.

Ever above the city's din,
Above the clink of yellow gold,
I hear a wild bird's ringing call,
I catch the scent of leaf-strewn mold.

Your grasses kiss my fevered cheek,
Your hawthorn drops her scented rain,
I am a child again and dream
That Heaven bides here, O flower-starred lane!

A law for the pensioning of superannuated and indigent citizens has been in operation in Denmark ever since 1891. After a 10 years' trial the people have become so favourably impressed by its results that a general demand has been made on the Government for additional legislation along the same line. The amendment of the law is one of the most important tasks of the Rigsdag now in session. The present law is based on the principle that every person who has reached the age of 60 and finds himself unable to earn a livelihood for himself and those dependent on him is entitled to public support without being regarded as an object of public charity or suffering disfranchisement.

LITERARY NOTES.

Charles Scribner's Sons will publish shortly "Music in the History of the Western Church," with an introduction on religious music among primitive and ancient peoples, by Prof. Edward Dickenson, of Oberlin College.

✧ ✧ ✧

"The Life of St. Patrick," by Muirchu Maccu Mactheni, translated and edited by Rev. Albert Barry, C.SS.R., has now reached a second edition. The language of the translation is very faithful to the original, and Father Barry is to be congratulated on the result of his labours. The publishers are Messrs. Gill and Son, and the price is 1s.

✧ ✧ ✧

Messrs. Isbister and Co. have acquired the right of publishing, in England and the British Colonies, Miss Stone's story of her experiences as a captive in the hands of the brigands. Miss Stone's narrative is to be published in the "Sunday Magazine," a popular periodical, which was remodelled and considerably enlarged at the beginning of the year. Miss Stone will contribute probably five articles, the first of which will appear in the May number. About the end of next September the articles, with a good deal of additional matter, will be issued in volume form by the same publishers. Both the magazine contributions and the volume will be illustrated.

✧ ✧ ✧

Monday, 7th inst., was the anniversary of the birth of William Wordsworth. The poet was born at Cockermouth. His mother died when he was five, and his father while he was at school. After school he went to St. John's College, Cambridge, and while there, or rather while walking in France and Switzerland during his last vacation, he conceived the idea of becoming the poet of nature. He was afterwards in danger of relapsing into imitations and tragedies, but was discovered by Coleridge. This was in June, 1797. Together he and Coleridge published the Lyrical Ballads, the latter contributing "The Ancient Mariner," the former "We are Seven," and many others. Thence onward he wrote copiously, but with curious unevenness, till his death in 1850. He was the immediate predecessor of Tennyson in the Poet Laureateship. It has been said that he wrote some of the best, and also some of the worst, poems ever published, but this doubtless was rhetorical exaggeration.

✧ ✧ ✧

Longfellow is evidently held in high esteem by the French educational authorities. They have selected nine of his poems, including "The Village Blacksmith" and "A Psalm of Life," in which the candidates for the diploma essential for an appointment as professor of English in normal and high-class schools will be examined during the next three years. The other works chosen are selections from Aikin and Barbauld's "Evenings at Home," and Miss Corner's "Every Child's History of England," and Wordsworth's "Michael." The diploma for second-class schools requires examination in Mrs. Browning's "Four Georges," Macaulay's Essays on Milton and Warren Hastings, and Pinero's "The Princess and the Butterfly." This is the outcome of a movement for the exclusive teaching of foreign languages in French schools by Frenchmen or persons willing to be naturalised.

✧ ✧ ✧

The American publishers, A. C. McClurg and Co., have gathered a pretty nosegay of "Right Reading: Words of Good Counsel," drawn from the ten authorities—Sir A. Helps, Carlyle, I. Disraeli, Emerson, Schopenhauer, Ruskin, J. C. Hare, Morley, Lowell, and Frederic Harrison. These names are an assurance of good reading, and something in so much advice will leave a profitable mark upon the mind of almost any one. Pithy and plausible as Emerson is (the passage is from his "Society and Solitude"), what protest might be raised—must be raised—to each of his "three practical rules," viz., "Never read any book that is not a year old; never read any but famed books; never read any but what you like." "For instance," says John Morley, on a later page, "it is a mistake to think that every book that has a great name in the history of books or of thought is worth reading. Some of the most famous books are least worth reading. Their fame was due to their doing something that needed in their day to be done."

✧ ✧ ✧

The Linguistic Survey of India has been mainly occupied during the past year on the languages of Assam, Eastern Bengal, and Upper Burmah. "Grammars and vocabularies have been prepared, and specimens edited, of some ninety languages, of most of which little but the names have hitherto been known." Among the new dialects unearthed is one in which conjugation is partly carried out by infixes instead of by the customary prefixes. The results of the survey strongly corroborate the theory, maintained by Dr. Hoernle, of a second Aryan invasion of India, the language of the newcomers being the "main parent of the classical Sanskrit." The extraordinarily complex character of the linguistic condition of the country is revealed by the fact that the list of the known dialects of India, compiled for the purposes of the Survey, contains 721 entries.

✧ ✧ ✧

"The Rambler" is, says the "Academy," coming after all into the twentieth century. We are agreeably informed by the present wearer of the Mantle, that "after nine months of private circulation 'The Rambler' will make his bow upon the book-stalls. The paper will be enlarged to sixteen pages, will contain some surprising illustrations, and will be sold for the modest price of 6d." Already—we fancy—the following conversation is borne to us on an asphodel-laden breeze:—

Boswell.—Will you, sir, permit "The Rambler" to be laid on counters and be cried like Mackerel?

Johnson (vehemently).—Sir, I know not why the Lucubrations of the Closet should fear the Manipulations of the Mart, or why that which I write in secret for the Publick Advantage should not be vociferated for my own.

Boswell.—But, sir, are you not over bold to increase the Cost?

Johnson.—Why, no, sir. How shall this inflation of Expense alarm the Town when it is perceived that to Reflections which instruct the Heart are added Delineations which surprise the Vision? Sir, when a man is surprised he is happy, and Happiness is worth Sixpence. Now, sir, if this were in Edinborough you might talk.

✧ ✧ ✧

Mrs. Craigie's recent address before the O. P. Club in the Grand Hall of the Criterion on "The Act of Composing Dialogue," was (the "Academy" remarks), a well-thought-out deliverance on a subject of great interest to playwrights and play-goers. Mrs. Craigie laid it down that dramatic dialogue is a symbol of real conversation, not a verbatim report. It may seem natural, but it cannot be so. It must be true to feeling, but it need not be faithful to colloquialism. Granted these facts, there are, Mrs. Craigie considers, seven ways or more in which the dramatist may meet his task. Each has been, and will again be, in fashion. The seven ways are:—

The Rhetorical,
The Sentimental,
The Romantic,
The Mathematical,
The Epigrammatic,
The Impressionist,
The Ironic.

✧ ✧ ✧

Although the year 1909 is still far distant, two of the leading universities of Germany are preparing to celebrate centennial anniversaries on an extensive scale at that time. These are Berlin, which, the youngest of the universities of the Fatherland with the exception of Bonn, will be one hundred years old, and Leipzig, which, the oldest with the sole exception of Heidelberg, will have passed its semi-millennial milestone. Both had interesting beginnings. Berlin being the child of hope in the darkest days of the Napoleonic era; and Leipzig, in 1409, the result of the emigration of two thousand German students from Prague, on account of difficulties with the Bohemian section of the institution in that city. In Berlin a special committee has been appointed, with representatives from all the four faculties, with the understanding that their chief work shall be the preparation of a history of the University, and the Leipzig budget for 1902 and 1903 sets aside a good sum for the coming jubilee. In reality, the University of Halle might celebrate its fourth centennial during the current twelvemonth, as the University of Wittenberg, of which the Halle institution is the continuation, was founded in 1502. However, no special celebration is contemplated.

✧ ✧ ✧

The admirers of the poet Longfellow paid the customary tribute to his memory recently on the occasion of the twentieth anniversary of his death, by placing two wreaths at the foot of his bust in Westminster Abbey. One of the wreaths was inscribed "From Americans in London," and the other "From some English admirers of an American poet." Close by was a wreath placed there a month ago, on the anniversary of the poet's birth, by a Mrs. Fellowes. Longfellow has become so consecrated by time that to many of the rising generation it may seem more than a score years since he joined the mighty ones whose

footsteps echo
Down the corridors of Time.

Critics do not place him in the front rank; some might refuse to him the attribution of genius. But he will ever be a standard poet, beloved of the many who like a poet who keeps to the beaten track, whose meaning is not too metaphysical.

✧ ✧ ✧

Having named these styles of dialogue, Mrs. Craigie proceeded to define each. Her remarks on the epigrammatic school of dialogue have a too special interest to be omitted. We quote from the "Stage":—

A comedy must in the nature of things be either sentimental or romantic, or satirical, and although we have had some brilliant examples of satire in English dramatic literature, both in the past and the present, it is not so national a gift as sentimentality. English people of this generation are not satirists. Their view of life is for the most part serious and kind. Satire really seems to wound them as it does not wound audiences elsewhere. I don't know why this should be the case, but it is so. And authors sometimes find themselves attacked for presenting studies of humanity which are not violently sympathetic nor especially flattering to the race. So pronounced is this antagonism to satire that it is not the custom in England to criticise any presentation of character apart from its amiability. The drawing may be masterly, but if the personage presented is not pleasing the author's work is dismissed as something unworthy of consideration. Now this brings me to the style which has been called epigrammatic, almost as a term of reproach. I believe I have traced this present dislike of the epigram to an idea that it comes from France, and represents a Continental rather than an English habit of thought. But the truth is that the greatest of epigrammatists have been Englishmen. The old English comedies, beyond any question, are the most epigrammatic productions in any language. Congreve has written more epigrams than all the French dramatic authors put together, and it is well known that Voltaire himself came to England in order to see the man who could write with such unsurpassed and dazzling brilliancy of phrase. Congreve was not a financial success, and the greatest comedy of manners in the English language was a failure because no audience could possibly think so quickly as that phenomenal genius. He condensed whole chapters of psychology into one paradox, whole family histories into one pithy speech. It makes marvellous reading, but I am afraid we must all call it a very difficult play. But the old comedy writers must not be judged by Congreve only. Wycherle, Farquhar, Vanbrugh, Sheridan, and Goldsmith were all masters of the epigrammatic manner. I don't place that school above the sentimental school, or below it. I merely wish to point out that it is purely English.

SCIENTIFIC TOPICS.

Professor Alexander Agassiz is in charge of an expedition to the Maldive Islands in the Indian Ocean which has recently been sent from the Agassiz Museum at Harvard. Professor Agassiz fitted out the expedition, and is assisted by W. McM. Woodworth. They expect to find rare and beautiful coral formations, and will gather as exhaustive a collection as possible. A steamer was chartered at Colombo, Ceylon, from the British India Company, to transport the expedition to the southern part of the Indian Ocean, where the Maldive Islands lie. The islands of the Indian Ocean are the only group remaining which Mr. Agassiz has not examined in his explorations for the study of coral. The islands are remote and unfrequented, and it is expected that the expedition will prove fruitful. The work will occupy about two months.

✧ ✧ ✧

Leather, even when soft, does not present itself to the mind as a particularly good filtering medium; indeed, it might seem just the reverse, so one must commend Mr. W. G. Stratton for noting his experience with it in the "Chemist and Druggist." The so-called chamois skin is there recommended as an excellent medium for the clarification of thick liquids. The leather is to be well rinsed in cold water, he says, and after being wrung to express the excess of moisture it should be affixed to the top of the funnel so as not to hang down very deeply. Small clothes-line pegs are useful for this purpose. Immediately after use, the chamois should be well washed and carefully dried. The same piece may thus be kept serviceable for a large number of filtrations.

✧ ✧ ✧

The Chinese language is derived from 214 root-words, which expend into the 4,000 or 5,000 words of daily use, and the thirty-odd thousand of the dictionary. It requires 11,000 spaces to hold a font of Chinese type. The large cases, or false partitions, are ranged about the room and divided into spaces for each individual type, each a word complete in itself. A Chinese printer, it is estimated, can arrange 4,000 characters a day. The work has been carefully systematised, and the characters are arranged according to their formation. A simple character designates its group, and the elaboration of form is the elaboration of its meaning, as our terminations and prefixes elaborate the root. A division is devoted to the simple character that stands for "wood," and all of its amplifications. In this space or column are to be found "bix," "bed," "plum tree," and so on, through a long list of objects pertaining to, or made of wood. Should an unusual word be needed type is cut and delicately patched to make the required character. Comparing our combinations of twenty-six letters and ten figures, besides common symbols, an idea of the labour of a Chinese compositor can be formed.

✧ ✧ ✧

In a reply to a letter asking the cause of autumn haze, the Chief of the United States Weather Bureau recently prepared a letter, part of which is quoted in what follows—The dry haze is undoubtedly due to fine particles of dust. The finest dust is composed of one or all of the following substances—namely, fine particles of soil or the dead leaves of plants, smoke or ashes from wood fires, salt from ocean spray, the shells or scales of microscopic silicious diatoms, germs of fungi, spores of ferns, pollen of flowers, etc. In the still air of the damp nights these dust particles settle slowly down, and the morning air is comparatively clear. During the daylight the sun warms the soil, which heats the adjacent air, and the rising air currents carry up the dust as high as they go. Under certain conditions which are named in the letter the layer of dust reaches higher and higher every successive day. During long, dry summers in India it reaches to 7,000 feet with a well-defined upper surface that is higher in the daytime than at nightime. This is a general explanation of dry haze weather, and applies to Indian summer also. The reason why there is such weather in the autumn is because there is less horizontal wind and less rising air.

✧ ✧ ✧

It is difficult to realise that the art of perforating paper was unknown fifty years ago. Prior to 1854 postage stamps were issued in sheets, the purchaser having to cut them up in the way he found most convenient. In 1848 an Irishman named Archer introduced a machine for cutting small slits round each stamp. This was tried by the English postal authorities, but for some unexplained reason it did not work to their satisfaction, and, notwithstanding that Archer went to great trouble and expense in altering the machine so as to meet the objections, it was refused by the Government. Archer then constructed an entirely new machine which cut out circular holes. He received sufficient encouragement to induce him to still improve his invention, when, in 1851, after three years' continual labour, the Treasury proposed to buy the patent rights for £100. This parsimonious offer was, of course refused, as Archer had spent considerably more than this on his various experimental machines. Eventually the matter was placed before the Select Committee of the House of Commons, and the pertinacious inventor was awarded £4,000, which, considering his apparatus in a few years saved the Government many thousands of pounds, was not excessive.

✧ ✧ ✧

The machine with which the Brothers Morley, in the latter years of the eighteenth century, made their enormous fortune was the stocking loom, invented three generations earlier by the Rev. William Lee, a Fellow of St. John's College, Cambridge, England. Lee's life-story is full of sadness. According to one account Lee, falling in love with and marrying an inn-keeper's daughter, lost his Fellowship, and was consequently reduced to extreme poverty. The wife knitted stockings for a living, and the husband, sitting by her side as she worked, watched the intricate movements of her hands, and was thereby led to speculate on the possibility of constructing a machine that would do the work more expeditiously. Lee came to grief, because his machine was believed to be a device for throwing people out of employment. He went ultimately to France, where he died poor and friendless, a disappointed man. Many years afterward English legislators so appreciated the value of the stocking loom that they prohibited its exportation; and so jealous was Parliament of foreign competition that it seems to have been doubtful, even as late as the middle of the eighteenth century, whether it was lawful even to publish a technical description of the apparatus. When the frame was introduced it completely revolutionised the stocking trade, producing fifteen hundred loops per minute as against the hundred loops in skilled hand-knitting.

✧ ✧ ✧

Mr. Ralph Noble, the electrical engineer of the Morgan-Gardner Electric Company, of Chicago, has invented a special electrical coal-cutting machine to suit the peculiar "longwall" system of mining practised in the English coal mines. The object of this particular machine is to undercut the coal. The first work of the miner is to cut under the seam so that it can be blown down. It is hard and wasteful work. As the miner must cut in some distance up the seam, a certain amount of coal is turned into slack by working upon it. The Morgan-Gardner electric machine undercuts to a depth of 6 feet a space of 4½ inches in height, and 3 feet 9 inches wide, without any waste whatever. The machine skids back automatically when it has cut its full length, and is reset for the next section in less than a minute. It cuts 242 square feet in an hour, doing the work of fifteen men. After a section is cut in this way holes are bored by electric drills and the coal blown down. Such machines can only be used when the "pillar and stall" system of mining is carried on. The new machine invented by Mr. Noble for use in England undercuts the face of the coal when the seam is sixty or seventy yards wide, after the manner of a reaping machine. It costs from £300 to £400. The machine is also used for cutting roadways, and in one of the English mines in which it has been installed it is at present used in cutting out a band between two seams of coal, which otherwise could not be moved without great waste. The use of the machine involves a saving of from 6d. to 1s. 6d. per ton of coal mined, according to the thickness of the seams. It thus enables many mines with small means, which are now disused, to be worked at a profit.

✧ ✧ ✧

The decision which was handed down in the United States Circuit Court of Appeals on March 10, by Judge Wallace, probably marks the termination of a bitter strife that has been waged by Mr. Thomas A. Edison with rival makers of moving picture apparatus. Mr. Edison was one of the first to secure patents on a chrono-photographic apparatus. When other manufacturers of similar devices entered the field, a series of legal battles began, in which Mr. Edison uniformly triumphed. For years he has received royalties from companies which are said to amount to many thousands a year. The last alleged infringer of the Edison patents to be attacked was the American Mutoscope Company. A decision was first rendered in favour of Mr. Edison in the United States Circuit Court. But the opinion now handed down by Judge Wallace on appeal reverses the decision of the lower Court, and declares not only that the American Mutoscope Company has not infringed the Edison patent, but even that Edison invented no new combination worthy of a patent. What Edison claimed was the use of a continuous film upon which the moving object was photographed. In order to refute the claims of Edison to priority of invention, the Court dwell long and learnedly on the history of chronophotography, and pointed out that as far back as 1864 a Frenchman named Du Cos had invented a moving picture machine very much like Edison's. A similar apparatus was patented in America in 1866 by Le Prince. The Court said—"It is obvious that Mr. Edison was not the pioneer in the large sense of the term, or the more limited sense in which he would have been if he had also invented the film. He was not the inventor of the film. He was not the first inventor of apparatus capable of producing single negatives taken from practically a single point of view in single line sequence upon a film like his, and embodying the same general means of rotating drums and shutters for bringing the sensitised surface across the lens and exposing successive portions of it in rapid succession. Du Cos anticipated him in this, notwithstanding he did not use the film. Neither was he the first inventor of apparatus capable of producing suitable negatives and embodying means for passing a sensitised surface across a single lens camera at a high rate of speed and with an intermittent motion, and for exposing successive portions of the surface during the periods of rest. The predecessors of Edison invented apparatus; no new principle was to be discovered, and essentially no new form of machine invented in order to make the improved photographic materials available for that purpose. The early inventors had felt the need of such material, but in the absence of its supply had either contented themselves with such measure of practical success as was possible or had allowed their plans to remain on paper. Undoubtedly, Mr. Edison, by utilising this film (not, however, his invention), and perfecting the first apparatus for using it, met the conditions necessary for commercial success. This, however, did not entitle him under the patent laws to a monopoly of all camera apparatus capable of using the film."

GLIMPSES OF THE PAST.

From the Dublin Newspapers of 1793.

MAY 9.—

The Privy Council sat at the Castle to take into consideration the depressed state of public credit, and to resolve upon salutary measures for its revival.

The Council was very full, and attended by all the Privy Councillors at present in town.

Mr. Cope, Mr. Binns, Mr. Jaffray, and several other respectable merchants, were examined before the Council relative to the present stagnation of public credit.

In consequence of their information, we understand that £700,000 will be appropriated to the laudable purpose of having the honest and industrious man, whose circumstances will admit of giving good security, from being ruined by temporary distrust.

MAY 28.—The following young gentlemen were elected by the Provost and Senior Fellows scholars of the house of Trinity College:—Edward Ryan, Michael Murphy, John Ewing, Robert Wray, Edward Chichester, Henry Wray, Arthur Henry Kenny, William Colles, Christopher James, Robert Torrens, William Henry Ellis, Thomas Meredith, Robert Hogan, Edward Blake, Hugh George Macklin, and Bartholomew Dungan.

Sunday last, being the name day of Trinity College, was observed as a high festival in our university. A very elegant dinner, in which every delicacy of the season was introduced, was given in the College Hall to a number of gentlemen, at which the Rev. Dr. Hall, Bursar of the College, presided; and in the evening, according to annual custom, grand cathedral service was performed in the chapel, in a very capital style, and with excellent effect. their choir evidently exerting their best abilities, and the masterly finger of Dr. Doyle on the organ being eminently distinguishable.

After which, a commemoration of the several benefactors of the University was delivered from the pulpit by the Rev. Mr. Usher, Junior Dean of the College, with much spirit and propriety.

Letters received in town yesterday from Enniskillen state that a recontre took place in that quarter on Tuesday, between a party of rioters, amounting to some thousands, assembled to oppose the magistrates of the county in carrying into effect the Militia Act, and a party of Dragoons, in which seven of the former were killed, eleven wounded, and above one hundred taken prisoners.

We hear that a great number of rioters assembled at Boyle, in the county of Roscommon, and were proceeding to commit outrages, till prevented by the military quartered in that town, who were obliged to fire upon them, whereby nineteen of them were killed, and several taken prisoners; amongst the latter was a gentleman of family, who, having run through his fortune, had joined and headed these misguided men.

At Manor Hamilton, in the county of Leitrim, a like disturbance arose; a mob set upon an officer going through the town with a small party of the military, who were forced to fire in defence of their own lives. Eight of the rioters were killed and several wounded, when the rest took to flight.

In the county of Wicklow, we are informed, the peasantry have exhibited a like disinclination to the militia, as in the neighbouring counties. Last week they assembled in a formidable body near Baltinglass, and sent a message to Lord Alborough, the Governor, inviting him to come and choose from among them such as he should think proper. His Lordship, apprehending for his personal safety, prudently declined obeying the requisition. We have not learned that they proceeded to any acts of violence.

By a letter received by a respectable merchant in this city, from a gentleman in Sligo, we are informed that, since orders arrived in that part of the kingdom for embodying the militia, a general insurrection of the lower orders of the people broke out almost instantaneously in the counties of Mayo, Sligo, Leitrim, and part of Roscommon; that they have proceeded to acts of violence upon the dwellings and properties of several of the most respectable gentlemen; particularly of the Hon. Joshua Cooper, of Mercury, which they plundered of arms and ammunition, and drank the wines and other liquors. They behaved in like manner in the houses of Capt. Ormsby, of Castle-dalgen; Mr. Tennison, of Coalville; Mr. Johnson, of Addersaid, county of Leitrim; as also his son, and Capt. Carter, of Drumlease. The Sligo volunteers (who are almost the only corps of that ever memorable body which is suffered to appear in arms) have been very active in suppressing the riots, and bringing the ringleaders to punishment.

MAY 30.—Two fine children fell into the Liffey yesterday evening, opposite Mr. Cardiff's yard, on Sir John Rogerson's quay. Captain Mathewson saw the accident from a window, and with the utmost speed jumped into the river with his clothes on, when, with great exertion, he was fortunate enough to save them from drowning. The captain's feelings and humanity are deserving of every applause; those who were present on the occasion were not backward in bestowing their warmest approbation.

Four fine horses, the property of a gentleman in the county of Meath, were starved last week by the negligence of a servant who had them in charge. The poor animals, in their endeavours for food, being locked up in the stable for four days, while the servant was in town, literally consumed the rack and manger; and a fir plank, which lay against on the walls, was found half devoured.

JUNE 5.—Yesterday being the anniversary of the birthday of our Most Gracious Sovereign, who then entered into the 56th year of his age, the same was observed throughout this city with every possible demonstration of joy.

There was a Levee yesterday at the Castle, which commenced at four o'clock, after which an ode was performed in St. Patrick's Hall, in honour of the anniversary of his Majesty's birthday.

The Lord Chancellor, the Archbishop of Dublin, the Archbishop of Cashel, the Earl of Bective, the Speaker of the House of Commons, the Chancellor of the Exchequer, Lord Clonmel, Lord Carleton, the puisne judges of the Courts of King's Bench and Common Pleas, the Barons of the Exchequer, the Lord Mayor and Sheriffs, attended the Levee yesterday at the Castle.

Several select parties dined yesterday at the different taverns in this city, to celebrate the aniversary of his Majesty's birthday.

The Levee at the Castle yesterday was but thinly attended.

The Lord Mayor made a very elegant appearance yesterday in going from the Mayoralty House to attend the Levee at the Castle. His Lordship went in the city State coach, attended by all his municipal regalia, which had a very grand and pleasing effect, highly honourable to the metropolis of the kingdom.

There was a State dinner given yesterday at the Castle by his Excellency the Lord Lieutenant, to all the great officers of State, in honour of the anniversary of his Majesty's birthday, but there was no ball or supper at night.

Last night there was a general illumination throughout the city in honour of the anniversary of his Majesty's birthday.

The illuminations last night in honour of the anniversary of his Majesty's birthday, were the most general that has ever been remembered in the city.

Lord Mountjoy, colonel commandant of the county of Dublin militia, entertained the officers of his regiment at dinner yesterday at his house in Henrietta street.

Yesterday being the anniversary of his Majesty's birth, the Royal standard was hoisted at the mast head of his Majesty's yacht, the Dorset, and at noon the guns were fired, etc., etc.

JUNE 12.—A few days ago, in Tullamore, King's County, a lad about thirteen years old, son to a respectable man in business, took a gun out of his father's house, and concealed it in an out-house, and next morning he went to an orchard, a little distance from the house, fastened the gun, charged, in a horizontal position in the cleft of a tree, with a cord, and tied a string to the trigger, which he brought round the butt end, and, in order to bring himself to a level with the gun, he raised a pile of stones, which he stood on, tucking back his shirt from his breast, which he placed close to the muzzle, he pulled the string, and was instantly dead: the charge passed through his heart. No other cause could be assigned for this act, than that his schoolmaster threatened to chastise him for idling from school.

JUNE 17.—Saturday morning, about six o'clock, a fire broke out in the north side of the new prison in Green street, in a part which is used as an hospital for the prisoners, which did a great deal of damage, and was not extinguished till ten o'clock.

It was set on fire by a prisoner named Laurence Size, who was put in that part of the jail. This he contrived to do on Friday night, by collecting a quantity of straw together, which the prisoners had used for beds, to which he set fire. It did not, however, break out with violence till six in the morning, when is was happily discovered by the turnkey.

The alarm being given, the engines repaired to the place, by which, and the activity of Alderman James and the High Sheriffs, the flames were prevented from spreading. The roof of that part of the jail is entirely destroyed, exclusive of other damage which the building has received.

The villain Size thought to make his escape by this wicked stratagem, while the place was in confusion. He is, however, fortunately disappointed, and now closely confined in one of the dungeons of the jail, to answer for this nefarious act, as well as many others with which he is charged.

THE TOWN OF SLIGO.

FROM A PICTURE OF SEVENTY YEARS AGO.

(From Lewis's "Topographical Dictionary of Ireland, 1837.)

Sligo, a sea-port, assize, borough, market, and post-town, in the barony of Upper Carbery, county of Sligo, and province of Connaught, $20\frac{3}{4}$ miles (S. W.) from Ballyshannon, and $103\frac{3}{4}$ (N. W.) from Dublin; containing 15,152 inhabitants. This place, which is the chief town of the county, is indebted for its importance to one of the first English settlers in Ireland. So early as 1242 a castle was erected here by Maurice Fitzgerald, Earl of Kildare, and at that time Lord Justice of Ireland. The same Earl, in 1252, founded also a monastery, which he dedicated to the Holy Cross, for friars of the order of St. Dominick, the origin of which establishment has by some writers been erroneously ascribed to O'Conor Sligo. In 1270 the town and the castle were destroyed by O'Donell; but the monastery escaped the ravages of that chieftain, and the castle was afterwards re-built by Richard, Earl of Ulster, in 1310. In 1360 the town was again destroyed by fire, and in 1394 it was plundered and burnt by Mac William Burgh. In 1414 the monastery was wholly consumed by an accidental fire, and for its restoration Pope John XXII. granted indulgences to all who should visit it and contribute towards the expense of rebuilding it. In 1416 it was rebuilt by Bryan Mac Dermot Mac Donchaigh, or Mac Donagh; and in 1454 Bryan Mac Donagh, sole monarch of Torcilill (now the barony of Tiraghrill), was interred within its walls. It continued to flourish till the dissolution, when it was granted to Sir William Taaffe. At the commencement of the reign of Jas. I., a grant of a market and two annual fairs to be held here was made to Sir Jas. Fullerton; and in 1613 the town was made a parliamentary borough by charter of incorporation. In 1621 it received a charter of the staple, incorporating a Mayor, two constables and merchants, with the same powers as those of Youghal. In 1627 Sir James Craig had a fresh grant of a market and two fairs, which in 1674 were granted to William, Earl of Stafford, and Thomas Radcliffe, Esq. In the war of 1641 the town was taken without opposition by Sir Chas. Coote, at the head of an army of 4,000 infantry and 500 horse. By his occupation of this post, Sir Charles had the means of keeping a check upon the royalists of the neighbouring counties; but the R. C. Archbishop of Tuam with great zeal collected forces for the recovery of the town, in which attempt he was joined by Sir Jas. Dillon, who was sent by the confederates to Kilkenny with 800 men to his assistance, and having forced his way into the town was on the point of expelling the parliamentarians, when he was suddenly alarmed by the intelligence of an army being on its approach to their relief. Upon this the confederated forces retired, and in their retreat were attacked

and routed by Sir Chas. Coote; the archbishop was killed in the action, and among his papers were found the important documents that exposed the connection of the King with the Catholic party. The parliamentarians afterwards abandoned the town, which, though threatened again by Sir Chas. Coote on his advance against Limerick, in 1651, was retained by the Catholics till the termination of the war. In the war of the revolution it was taken by the brave Enniskilleners, who also defeated a large body of James's forces that were advancing against it, and took from them a considerable booty; but the garrison was shortly after driven out by Gen. Sarsfield, and the place was finally reduced by the Earl of Granard.

By a charter dated the 20th of March, 11th of Jas. I., the town was incorporated under the name of "Provost and free Burgesses of the borough of Sligo;" the corporate body to consist of a provost, 12 free burgesses, and a commonalty. A charter granted by Jas. II., in the 4th year of his reign, has not been acted upon. By letters patent of Chas. II., in the 27th of his reign the town and certain lands were erected into the manor of Sligo, with a court baron with civil jurisdiction to the amount of 40s., a court of record with civil jurisdiction to the amount of £100, and a court leet to be held before the seneschal; no manor courts are now held. The charter also conferred upon the provost and burgesses the privilege of returning two members to the Irish parliament, which they exercised till the Union.

The scenery is pleasingly diversified, and in many parts beautifully picturesque; the view of the town at the head of the bay, environed by mountains and embosomed in a richly cultivated country, is strikingly romantic, especially in the approach from Dromahaire; and on the road from Manor-Hamilton is a point where, emerging from the mountains, a spacious and magnificent scene, embracing the whole of the town with its surounding district, opens at once on the view. The approach to Sligo by the Dublin road is also very beautiful, having Lough Gill with Hazelwood demesne on the east; the bay of Sligo, with its two bold headlands of Benbulben and Knockaree, on the west; and in the centre the highly picturesque town of Sligo. Among the various residences that embellish the neighbourhood, the most conspicuous is Hazelwood, the seat of Owen Wynne, Esq., a noble mansion, situated on a peninsula stretching into Lough Gill, and surrounded by a richly-wooded demesne, commanding beautiful views over the lake and its wooded islands, terminated by the mountains which rise from its shores on the south. There are some remains of the beautiful and spacious monastery of Sligo, serving to convey some idea of its former magnificence: they consist of three sides of the cloisters, with a finely vaulted roof, and are separated from the quadrangle by a long series of pillars, of which several are sculptured, and of pointed arches, in the early English style of architecture. The great east window of the church is of beautiful design and highly enriched with tracery; the high altar, which is embellished with sculpture in relief, is almost hidden by the accumulation of disinterred bones; the nave is

Seal.

spacious, and the roof is supported by ranges of pillars at intervals of four feet from each other; the central tower is complete, with the exception only of the battlements; to the right of the high altar is the tomb of O'Conor, with the effigies of himself and his lady, and there are numerous vaults and cells.

THE FOREST.

Deep and still and dark and lonely,
Sways the forest, stately-grand,
Wrapt in thoughts the pale stars only
Understand:

Whether zephyr soft play o'er it,
Or the tempest passionate roar—
Beating time to Nature's music
Evermore!

When the soft breeze sighs, the Forest,
Gently bending to and fro,
Keepeth time to that sweet singing
Soft and low:

But when Nature's passion-music
Swelleth forth tumultuously,
Writhe the trees in deep and heartfelt
Sympathy;

For, within its dark recesses
Many an echo silent dwells
Of that Voice that sounds from Nature's
Deep heart-wells:

Clear and silvery songs of brooklets,
Summer-songs of joyous birds,
The strange songs the stars shower downward
Without words.

When, in Spring, the tender leafbuds
Burst to life, when Summer's breath
Warms them, and their fuller beauty
Melloweth;

When sad Autumn hastes the sere leaves
On to Winter's snowy bier—
E'er the winds sing, and the Forest
Loves to hear.

* * *

Deep and still and dark and lonely
Thou, my heart, hast ever been:
Spring and Summer, Autumn, Winter
Thou hast seen:

But within thy deep recesses
Caged echoes ever dwell
Of those full-voiced songs great Nature
Sings so well!

Moved by each wild breath of Nature,
View her pictures dark and bright:
Ever thrill with love within me
At the sight—

Whether zephyr soft play o'er thee,
Or the tempest passionate roar,
Beating time to Nature's music
Evermore!

A.H.T.B.

EVERYONE TO HIS TASTE.

If you should travel around the world you would learn to eat your dinner in a good many ways. In Turkey you would learn to sit on the floor, cross-legged, and eat off a round tray, without knives or forks, plates, glasses or napkins. All the guests eat with their fingers out of the same dish. If you dined with the Arabs you would see no knives or forks; and if your host offered you a choice bit of meat you would be expected to open your mouth, and let him put it in. The Arabs use only the right hand in eating; and, what is still more funny, they will pull apart or carve turkeys and fowls with only one hand, and without a knife. If it is hard to separate, one of the guests will lend his right hand. In Siam you would be treated to ants' eggs; and in Burmah to locusts, stuffed and fried. All you young folks would like to eat in Japan: for they serve candy and sweet things very often, and what one can't eat one is permitted to take home. At all grand feasts guests are expected to bring servants, with baskets, to take back the leavings.

In Abyssinia it is a mark of good breeding to smack the lips while eating; and I'm sure you'll not be surprised to hear that Abyssinians eat their meat raw. In South America you would eat lizards and snakes, and among our American Indians you would be treated to roasted grasshoppers. In Otaheite you would have your dinner alone, in a basket; and if you were in the fashion you would sit down on the floor, turn your back to everybody and eat. It is there considered very improper to eat with others. Snails and horse flesh would greet you in France.

But the funniest dish you would see, I think, would be in China, where they serve up little crabs—alive! Just as they sit down to dinner the tiny crabs are put into a dish of vinegar, which makes them very lively. Then they are put into a covered dish and placed on the table. When everyone is ready the cover is snatched off, and instantly the table is covered with scampering crablets, running for their lives. Now comes the fun! The guests, with both hands, grab right and left, and stuff into their mouths these lively, wriggling crabs, and eat them down with great relish.

While you're on your journey, perhaps you would like to "skip" New Caledonia; for there, if people were polite to you, they would serve up roasted or even raw spiders. "Horrid!" did you say? Well, it does seem disgusting to us, but people who have eaten them say they taste like nuts. I've read of one young lady in Europe who never saw a spider in its web but she caught it and ate it at once, as you would eat a cherry. I don't know that spiders are any worse than grubs, which are great, fat worms, as big as a man's thumb. In India you would see them roasted and served instead of fruit at dessert.

Would you fancy eating roasted ants by the handful, as you eat sugar-plums? They taste like sweetened cream, so travellers say—I never tried them. But really, when you come to think of it, none of these insects that we consider so disgusting and horrible look any worse than lobsters and crabs, which we eat freely. It is a good deal a matter of fashion, after all; and I dare say if you had been brought up in India you would enjoy digging up a centipede eighteen inches long and eating it like a stick of candy, as the children do there, according to Humboldt.

OVERPRESSURE IN SCHOOLS.

A Berlin instructor has been contributing to a German medical weekly some interesting results of his experimental studies on the question of the overpressure of school children. The best working days are, he finds, Mondays and Tuesdays, and the first two days after a holiday. The insertion of a holiday in the middle of the week would, it is thought, tend to a revival of the mental freshness which only lasts, as things are, till Tuesday afternoon. The best working hours are, similarly, the first two in the morning, and should accordingly be reserved for the severer tasks: the three hours' afternoon teaching in the higher schools is especially fatiguing, and there should always be an interval in the middle. Holidays have, of course, a freshening effect, but it is not observable for more than four weeks—another reason for the more frequent insertion of rest days in working time.

PAYING MEMBERS
OF THE
OLD IRISH PARLIAMENT.

GRANTS FOR WAGES AND EXPENSES

INTERESTING 17TH CENTURY FIGURES.

In the "Anthologia Hibernica" for August, 1793, the following interesting article, bearing the signature "D. H.," appeared:—

When I first inquired into this subject to satisfy private curiosity, I expected to find but little trouble in gratifying it, by consulting our statutes and writers on law. In this I was greatly disappointed, and was obliged to resort to the practice of England in this respect. I lamented, as many others do, that we have no history of Irish law, of the establishment of our courts, and the succession of our judges; subjects extremely curious and interesting. A gentleman of splendid rank and fortune (Mr. C.), but of superior patriotism and good sense, wished some time ago to patronise such works, but no one was found disposed to undertake them, though, it is confessed, the kingdom abounds with men of talents and learning. Hoping to induce some of them to turn their attention to these pleasing inquiries, I ventured to give a few observations on the statutes, and an historical memoir concerning the inns of court, both of which appeared in the first volume of the "Anthologia." The favourable reception these met with, emboldens me now to sketch out what has occurred respecting the wages formerly paid in Ireland to members of Parliament.

The great charter granted by King John, A.D. 1215, shows Parliament was then composed of nobility, ecclesiastical dignitaries, and tenants in capite; but by the writs issued in 1266, knights, citizens, and burgesses are expressly mentioned as part of its body. Whether expenses or wages were settled for the latter, as soon as they became a part of the great council of the nation, has not been discovered. Lynne, in his brief register, could find no notice of them earlier than the reign of Edward I. In the reign of Edward II. we are told knights of shires had five shillings a day, and citizens and burgesses two. These were large sums at that time, and equal to five times the same sums at this day. Accordingly it was severely felt by the people, who endeavoured to evade it by making agreements with their members on the easiest terms, or by some quirk. Of the latter, a remarkable instance occurs in the 12th of this reign:—

A writ had been directed to the Mayor and Bailiffs of Lincoln to elect two citizens: accordingly they chose Thomas Gamel and Henry Boyl, but they refused to go to the Parliament. The writ allowed them two shillings a day. The citizens interpreted this as a shilling for each, and not two shillings each; this was offered to the members, and rejected. This was in 1319. About three years after, the writs did not state precise sums for members, but only "rationabiles expensæ." These were to be proportioned according to the distance. The knights of Northamptonshire now received about 7s. 8d. apiece each day., In the reign of Edward III. four shillings a day were allowed to knights, and two shillings to citizens and burgesses. These wages were recoverable from Sheriffs, Mayors, and bailiffs, in the exchequer. At the end of every session, the King usually thanked them and commons, and concluded by desiring them to sue forth their writs for their fees. Many instances are in Cotton's Records. However, these fees, or wages, were always considered as payment for services in Parliament; and hence, in the first of Henry V. the people prayed to be discharged from the wages in the last year of the last reign, because nothing was done in that Parliament, but their petition was rejected.

The laws and the constitution being the same in Ireland as in England, we may presume the practice of both were the same. Little, however, has hitherto appeared to authenticate the identity in remote times. In the 50th of Edward III. the writ to James Botiller, justiciary of Ireland, directs that rationabiles expensæ should be paid to the commissioners who were elected by shires, cities, and boroughs, to attend the English Parliament. The sums, from the circumstances of the case, must have been very great. In a valuable record I find the wages, or fees (as they were called), of a knight of the shire in 1613 was thirteen shillings and four pence; for a citizen, ten shillings; and for a burgess, six shillings and eightpence; and the following sums were due to members for their attendance that session:—

ARMAGH COUNTY.				
Sir Toby Caulfield	£130	0	5	
Francis Annesley	,,	,,		
ARMAGH BOROUGH.				
Mark Usher	£99	6	8	
Christopher Conway ...	,,	,,		
CARLOW COUNTY.				
George Bagnall	£198	13	4	
Morgan Cavanagh	,,	,,		
DUBLIN CITY.				
Richard Bolton	£149	0	0	
Richard Barry	,,	,,		

And so with the rest.

On the 25th of November, 1614, an order respecting the fees of members was made, which is recited in the following order of the House of Commons the next year:—

15 May, 1615.—Whereas by an order of this House, made the last session of Parliament, every knight of the shire was allowed 13s. 4d. Irish, per diem, from the country, during their attendance in Parliament, and every citizen of any city, being a county in itself, 10s.; and every burgess, 6s. 8d., which were then rated so high for divers considerations, then seeming good to the House. But now the House, entering into further consideration, does think fit to order, that during the present session of Parliament, for ten days before, and as many after, every knight shall be allowed but 6s. 8d., every citizen 5s., and every burgess 3s. a day. But, nevertheless, when any agreement is made for any more than by this order is set down, the sum overplus more than this order, is to be duly paid according to their agreement; and so, if for less,, then less to be taken; any thing before in this oredr contained to the contrary notwithstanding.

From the Commons' Journal of the 11th of May, 1615, we perceive a warm and unpleasant conference took place between the Lords and Commons on the quantity of wages, and on those who were to contribute, and who were to be exempted. On these heads both parties separated in an ill humour, without coming to any determination. However, in four days after, in a grand committee, it was settled: "That all lands, as well free as chargeable should be contributary to knights' wages, as in former times they have been; except the ancient possessions of lords spiritual and temporal, whether they be in their own hands, or in the occupation of their tenants at will or sufferance, and their leases for years or jointures, and downies of ladies dowagers. But if they have acquired or purchased any lands sythence, or passed any lands away in fee-farm, or in tail, these lands to be likewise contributary. Glebe lands not to be charged.

August 2, 1634, the Commons confirmed the old fees to members—viz., for a knight, 13s. 4d., a citizen, 10s., and a burgess, 6s. 8d. a day. However, it was reduced the 17th of June, 1640, to 10s. for the first, 7s. 6d. for the second, and 5s. for the third. In 1662 Sir John Ponsonby reported from the committee appointed to consider of former precedents for paying the wages and expenses of knights, citizens, and burgesses in Parliament, that they had perused them, and that in 1634, every knight was to receive 13s 4d.., every citizen 10s., and every burgess 6s 8d. a day, for ten days before and ten days after the session. Sir John proceeds to state what has before been related, and concludes, that the committee offer it as their opinion, that the same allowance as formerly be made to members, and the House agreed to it.

In 1665 Dr. Margetson reported to the House that inconveniences had arisen from collecting the wages of members, and that no warrants should issue for any wages due from the 27th of September, 1662. Here I apprehend the payment of wages to members of Parliament ceased.

PHENOMENAL MEMORIES.

Many of the greatest men have had phenomenal memories, says Professor E S Holden. Cæsar knew the names of thousands of soldiers of his legions. A modern man of science often has a prodigious memory for special terminology. Professor Asa Gray asserted that he could at once recall the names of something like 25,000 plants; Professor Theodore Gill can do the same for fishes. Our memory for mere words is itself much more extensive than is generally admitted. The average well-to-do child of two years has a vocabulary of some 500 words, and its father may have the command of 20,000 more. The 10,000 verses of the Rig Veda have, for 3,000 years, been accurately preserved in the memories of the Brahmins. Not one Brahmin alone, but thousands, can to-day recite it word for word. Thousands of Mohammedans, likewise, know the Koran by heart, as all learned Chinese know their classic books. The chiefs of Polynesia can and do repeat hundreds of thousands of words in their genealogies—taking days and even weeks for the recitation. Hundreds of pianists can play all day, and many days, by memory, and I have myself seen Von Butlow conduct Beethoven's Fifth Symphony without a score. Chess players have a visualising memory; musicians have an auditive and a motor memory; while arithmetical prodigies may have any one of the three or a combination of all.

A DAY OF BATTLES.

Many of the most famous battles of history have been fought on Sunday. To go no further back than the beginning of the present century, the battle of Eylau, won February 8, 1807, by Napoleon over the Russians and Prussians, and the battle of Friedland, June 14, 1807, won by Napoleon over the same allies, were both fought on Sunday. May 21, 1809, Napoleon was defeated at Esseling; on Sunday, May 2, 1803, he won the victory at Lutzen; and on Sunday, June 18, 1815, was overthrown at Waterloo. Wellington, besides Waterloo, won several of his greatest victories on Sunday, being victorious at Vimiera, in Portugal, August 21, 1803; at Fuente d'Onoro, May 5, 1811; at Orthez, February 27, 1814; at Tarbes, March 20, 1814; and at Toulousse, April 10, 1813, all these being fought on Sunday.

THE REV. ROBERT WALSH—A CORRECTION.

(To the Editor of the "Dublin Penny Journal.")

Belville, Donnybrook, April 19, 1902.

Sir.—May I be permitted to correct an inaccuracy in your interesting journal for this week. My grandfather, Rev Robert Walsh, was the youngest son of a large family. His brother, Dr Edward Walsh, was the eldest.—Yours faithfully,

JOHN E. WALSH.

[We were led into the error pointed out by Mr Walsh by a statement in Webb's "Compendium of Irish Biography."—Editor "D. P. J."]

LANDING OF THE FRENCH AT KILLALA.

BY AN EYE WITNESS.

The following graphic description of the landing of the French at Killala in August, 1798, appeared in one of the numbers of the "Dublin Penny Journal" in 1833. The writer, who signed himself "A. I." having given a description of the town of Killala and noted the historic facts in connection with the district surrounding it, thus told what he saw of the coming of Humbert and his comrades in arms:—

A serene and cloudless sky, and brilliant sun, rendered the 22nd of August one of the finest days of that remarkable season.

It was on the morning of that day, whilst proceeding from Palmerstown to Killala, I first beheld a ship of war; three vessels of unusual size, magnified by the still calm of the ocean, stretched slowly across the bay of Rathfran (on the larboard tack), weathering the reef which divides it from the bay of Killala; a smaller vessel appeared in the offing.

About twelve o'clock, the frigates were visible from the steeple hill and the higher parts of the town; they showed English colours.

The collector and some other persons proceeded on board; between two and three o'clock, p.m., the frigates were standing across towards the bay of Rathfran; marks of agitation and restlessness became now apparent amongst several of the inhabitants. I met O'Kearney, the classical teacher, as he was returning from the "Acres," a remote and elevated quarter of the town, a half-suppressed smile of satisfaction played on his countenance as he saluted me; it was the last time we ever spoke. At four o'clock the agitation and alarm increased; the revenue officers had not returned. The inhabitants were fronted on the Steeple Hill, Captain William Kirkwood, of the yeomanry, now joined in uniform, as were several of his corps, who now begun to make their appearance. Two officers of the Carabineers arrived from Ballina; they had been at the Cape of Good Hope, and were judges of all those sort of things; we awaited their opinion with anxiety—they could form none. "Here," said Captain Kirkwood, handing his telescope to an old seaman belonging to the town, who had served under Howe and Rodney, "here, tell mé what these vessels are." "They are French, sir," replied the veteran, "I know them by the cut and colour of their sails."

Quitting the crowd, Captain Kirkwood was accosted by Neal Kerugan (afterwards an active chief of insurgents), inquiring, what nation the frigates belonged to. "Ah, Neal," replied the Captain, "you know as well as I do." Returning now to Palmerstown, I had scarcely arrived, when a neighbouring peasant on horseback, breathless, and with the perspiration of terror streaming down his forehead, announced that a body of strangers, in dark uniforms, had landed from the ships—were distributing arms—had been joined by several of the inhabitants, and were actually advancing—"There they come," said he, pointing to an eminence a mile and a half distant, over which the road passed, and we beheld a dark and solid mass, moving onwards; their arms glittered in the rays of the declining sun. They were occasionally visible as they passed over the inequalities of the ground, till emerging from a banky part of the road, within a quarter of a mile of Palmerstown, we beheld their column of about 800 men, silently, but rapidly, advancing. They were preceded at some distance by a single horseman, a robust middle-aged man, dressed in a long green hunting frock, and high conical fur cap; stopping for a moment, he saluted us in the Leinster patois of Irish, with "Go de mu ha tu" (how do ye do?)—) A general officer (Surrazin) and Aid du Camp (Mr. Tone) were now close up, a laugh of approbation was interchanged between the Chasseur and his General.

The Commander-in-Chief (Humbert) seated in a gig now advanced at the head of this celebrated band of warriors, which regularly, but with precision, pressed rapidly forwards; calm and unconcerned, they presented no indication of men going into combat. Having crossed the bridge of Palmerstown, about 300 men were countermarched and bivouacked on the green esplanade in front of the village; the remainder marched on to Killala.

The sun had set behind the western wave and the grey twilight of evening was fast advancing, as the French, descending the hill of Mullagharn, beheld the yeomanry and a party of the Leicestershire fencibles, forming on a commanding ridge at the entrance of the town; Captain Kirkwood had been just apprised of the hostile landing, by a fisherman, who had crossed at Rathfran, whilst the French detoured by Palmerstown; and had ordered his men to this post, from which, however, they retired into the town on the nearer approach of the French. Three streets diverge from the centre of Killala, in the form of a sportsman's turnscrew: one southerly towards the "Acres;" a second westerly, by which the French were advancing; the third or main street, easterly, winding by the Churchyard wall, on a steep declivity to the Castle; and onwards towards Ballina.

It was on the edge of this declivity the military re-formed; Moreau could not have chosen a more judicious position for a retreat. Humbert on reaching the outskirts of the town made his dispositions: he detached a party under Neal Kerrugan (who had first joined him) across the Meadows, to enter by the "Acres" road, in order to cut off the retreat of the military by that route, or turn them if in position; he advanced a few sections, en Tirailleur, to occupy the ridge from which the military had retired. The Chasseur galloped into the town to reconnoitre; he was scarcely out of sight in the winding street, when a single shot was heard, followed at a short interval by a random scattery volley; it was a moment of anxious suspense, but the chasseur bore a charmed life. On approaching the Market place, he was challenged by a yeoman (a young gentleman of the place), who had loitered behind his companions, with "What do you want, you spy?" The answer was a bullet through the body, and he fell dead into the door of a house at which he was standing. The veteran then reconnoitred the line of the military, and receiving their fire, returned to his comrades; he related these events with the sang froid of an amateur; he had been in twenty battles, and had never had the honour of receiving the entire fire of the enemy's lines before. The Tirailleurs were warmly engaged; the column redoubled its speed, and at the centre of the town a party of grenadiers, which marched at its head, deployed on the main street; they were received by an ill-directed volley from the military, at about one hundred yards' distance. Their captain was struck with a ball on the foot. Foaming with rage he ordered his grenadiers to charge. It was refused by the military; the Yeomanry first broke ground, and were soon followed by the Fencibles. Protected by the declivity and the churchyard wall from the French fire, the Yeomanry escaped through the castle gates; the Fencibles fled onwards towards Ballina; Captain Kirkwood turned down by his own house to the strand, expecting to reach Ballina unperceived by that route. One yeoman remained, Mr. Smith, the respectable apothecary of the town; aged and afflicted with gout, he was unable to keep pace with his companions; excluded, on shutting the castle gates, he struggled to reach his own house. It was not distant one hundred yards; but his days were numbered; the chasseur was at his heels. Eager to make Captain Kirkwood, whom he first observed, his prisoner, he disdained the same favour to a soldier belonging to the ranks—he fired, and the unfortunate man fell a lifeless corpse.

A. I.

MOTTOES.

The origin of heraldic mottoes might probably be traced to two sources, in themselves diametrically opposed to each other—religion and war. "Extremes," we are told, "sometimes meet," and certainly these two feelings did coalesce in the institutions of chivalry. It is uncertain whether we ought to deduce the origin of mottoes from those devout ejaculations such as "Drede God!"—"Jesu mercy—Lady helpe," which occurs on ancient tombs, or from the word of onset, employed by generals on the battlefield to stimulate their soldiers to great feats of prowess. The preponderance in point or number of religious mottoes would incline us to the former supposition. The war-cry known in Latin as the "clamor militaris," in French as the "cri de guerre," and in the Scottish language as the "slughorn" or "slogan," is of very remote antiquity. In early Scripture history we have an example in "The sword of the Lord and of Gideon," the word of onset employed by the Hebrews against the Midianites in the Valley of Jezreel. Among barbarous nations at the present day is has its representative in the war-whoop or yell, employed as well to imitate the courage of their own party as to inspire terror in the hearts of their enemies. From an early period the phrase "a boo" was thus employed by the Irish.

The University of Pennsylvania recently came into possession of what is regarded as the oldest piece of writing in the world. It is not a manuscript, but a fragment of a vase which was broken in the raid on the ancient city of Nippur. The inscription is in picture writing, and indicates that the piece dates back to forty-five hundred years before the Christian era.

OUR WEEKLY STORY

A MATTER OF TASTE.

BY K. F. PURDON.

"I can't imagine," said Lady Charlotte, solemnly waving her gold pince-nez to and fro, "I can't imagine what more Jack wants, or indeed expects! A fine, really striking-looking girl—shoots, plays golf, and the fiddle—so many pursuits they might have in common, and, er-er, she has money, too; and yet, just four days after Betty's arrival, Jack chooses to disappear! Really, I don't know what pleasure one's children are! or, indeed, what compensation life offers for all the worries," and Jack's mother sighed deeply, as she laid down her Dresden tea-cup, and turned over the sandwiches to look for the pate de-foie gras. "And so well as Betty was looking, too!" chimed in a sympathetic voice; "I hear that the men in the smoking-room last night seemed more than half jealous, she walks a mountain so well, and scarcely even misses a bird; perhaps her skirt is a trifle short, and Jack is so refined——"

"Ah, nonsense, my dear, you can't have everything!" said Lady Charlotte; and her meek middle-aged daughter said no more.

They were having afternoon tea beneath a great weeping ash. Through a parting in the boughs they could see Lough Corrib shimmering and blue below.

"All this," Lady Charlotte was wont to explain, with a comprehensive sweep of the gold eyeglasses, that took in half Galway—"all this once belonged to us"; and she never knew what to blame for their reduced circumstances. For Jack, handicapped with the responsibilities of a big estate mortgaged to the hilt, she felt that there had been a special interposition of Providence, when she had succeeded in arranging a house-party for the grouse-shooting, which included Betty, the heiress.

Betty, with her big diamonds, her big person — she was known among the sportsmen as the "grenadier"—her big voice, her big fortune; Betty had started in life as plain—very plain, Eliza. But that was before her father's soap had become a household word. "Betty" is quaint, old-world, and Betty she had elected to become.

She was sitting, while this conversation was in progress, somewhat disconsolately on a mountain side, near a brown trout-stream, that was dancing on its downward path through ferns and moss and heather. Betty had suddenly slipped in crossing this brook, and slightly wrenched her ankle—just enough to give colour to her wish to sit still and be alone.

She didn't care a snap about shooting! But she did care, and care a great deal, about handsome, high-bred, gentle Jack, and his beautiful, if somewhat dilapidated, home—Jack, whom she knew, as well as if she had been told, that she was asked to meet; Jack, who was always effacing himself—why did he avoid her She took out a cigarette, and began to think the situation over.

There was another consideration—that wretched old Duke; she might have his title, and the diamonds, and the entry into the best circles by holding up her finger. He wanted her money; her people wanted the prestige of such an alliance. But could she do it? Betty was so big and so robust, no one gave her credit for sentiment; yet the thought of Jack was safeguarding her now from a miserable mistake.

While she was reflecting, along the winding, white mountain-road that lay a few hundred yards below her, an explanation to part of her puzzle was coming slowly into view; Jack, in his faultless flannels, tall and slight, and stooping a little as he wheeled his bicycle along; Jack, the dreamy, silent Jack, talking most animatedly to a girl walking beside him—"a little bit of a thing!" Betty reflected with complacency, "in a battered sailor hat and an old red cloak of Claddagh flannel!"

Yes, Betty, true enough! But if you were Jack, and had had one look into those wondrous eyes, you would have been longing, as he was, for another, just to decide if they were blue or black; you would have been thinking so much of how well the red cloak set off the cloudy hair, that you would never have noticed what a shapeless hat covered it.

A new clergyman had come to the parish the winter before, while Lady Charlotte and her olive-branches were in London, and this was Eileen, his only child. She was returning from a choir practice, and wistfully wishing she could "live up to" Jack's conversation. Jack was quite satisfied with her silence. A pretty girl has only to appear attentive, and it is reckoned unto her for righteousness. But Eileen didn't know this, and great was the relief to the shy little maid when she caught sight of Betty on the hill, waving a handkerchief. Jack looked too, and gloomily recognised what he had begun to dread as a possible fate.

"What on earth does she want" he asked savagely—and he had been feeling with satisfaction that he was actually capable of falling in love—that is, with the right person; "I suppose we'd better go and see."

"What a mercy you were passing!" began Betty in the high, loud voice Jack disliked so much. "I've gone and hurt my ankle, and——"

"Oh how dreadful!" exclaimed Eileen, forgetting her awe of the great heiress, whom she had met the evening before at a "duty dinner" given by Lady Charlotte to the "frumps" of the neighbourhood. "Let me take off your gaiter, and bathe the ankle."

"That's all very well," said Betty, good-humouredly, "but how am I to get home?"

Jack looked helplessly at the horizon; he was apt to fall into dreams when any demand for any suggestion out of a difficulty arose, and Betty's visions of tottering home on his arm began to fade.

Suddenly wheels were heard—a car came rapidly into view.

"It's the doctor," exclaimed Jack; and galvanised into activity at the prospect of some one else to take the lead, he dashed down the heathery hill.

Betty noted that Eileen's ministrations suddenly ceased; and while the doctor was making his examination, Jack had opportunity to watch the wave of colour that came and went over Eileen's rounded cheek.

This young man, in the homespun suit and deerstalker, was a discreet doctor. He possessed one of the elements of successful medical practice, and never made little of a trifle affecting a patient who could pay. Everybody knew who Betty was, why she was there, what her fortune was. The doctor tore his own handkerchief into stripes, and was very careful about the bandaging.

"You can take my trap back to the Castle," he said to Jack.

"Er—hadn't you better see your patient safely home?" Jack suggested, apprehensive of a tete-a-tete with Betty.

"Not the least occasion! besides I'm due at a fever-case ten miles up the mountains; by the way, lend me your grid, will you? I'll return it when I come to look at that sprain to-morrow."

So Jack, gloomy, and Betty radiant with hope, drove off together, and Eileen resumed her homeward trudge, again accompanied by a young man and a bicycle.

But it was very different now. How easy it was to talk to her young doctor. They had come to a private understanding those two weeks before; "but it can't be for a long time, my darling," he said. "I think you'd better go in for Jack Ormonde—eh?" he added, half suspiciously. But Eileen gave him one look of love, and he was content.

Betty and the doctor managed that sprain judiciously. She couldn't be too careful about using it to soon, he said. So it happened that a month later, at another duty entertainment, she still limped, and Jack was still often in requisition as a live crutch.

"How well dear Betty looks to-night!" observed Lady Charlotte, as the heiress, a magnificent goddess in white silk tea gown, just defined with sable, disappeared into the conservatory, from the drawingroom, supported by Jack. Betty understood a becoming negligé, and Jack was beginning to appreciate the softer side of her character, which it typified.

"What is it? You look as if you had seen a ghost!" she exclaimed, as she seated herself. "Oh, we're intruding," in a good-natured whisper, as she, too, recognised that they were not alone, in the fragrant dimness among the flowers. "Why, he told me all about it only this morning, when he was paying his farewell visit; sweet little girl, I hope she'll be happy!" And Betty' eyes grew moist, and her voice was very low, for once; and Jack found himself thinking how kindly she was, how genial and even-tempered. And she was looking positively handsome—in fact, it was the

"Moment one and infinite;"

and Jack's fate was sealed then and there.

In fact, Betty had heard the young doctor's confidence with much interest, for she had seen in Eileen a possible and very formidable rival.

"And how she could look at him beside Jack!" Betty reflected; "but every one to his taste!" She had learned to suit herself to Jacks.

"They are just made for each other!" declared Lady Charlotte. The Fates had been propitious, and Jack had yielded to the force of circumstances.

"She's a great deal too good for him!" commented Eileen. "Such a slow, tiresome creature as he is!"

"Tastes differ evidently," said the doctor, and just as well they should.

He was gloating over the cheque by which Betty had acknowledged his skill and care, and trying to make up his mind not to spend it all on a ring for Eileen.

LIGHTHOUSE IN THE DESERT.

There is one lighthouse at least in existence, which is not marked upon mariners' charts. It stands far out in the lonely desert of Arizona, and like the friendly beacon towers which dot our coasts, it has been erected for life-saving purposes. It marks the sight of a well—the only spot where water is to be found for 45 miles to the eastward, and at least 30 miles in any other direction. This well, a veritable oasis in the desert, is a godsend to the weary traveller. The water, sweet and cool, is raised from a depth of 200 feet by means of a large bucket. The revolving drum above it is worked by an old blind mule, which knows to an inch the number of rounds it must make before the clanking bucket rises to the point where it tips the water over in a trough. There is a little station at the spot, and cattle are always to be seen standing around the water tanks.

THE INFLUENCE OF MUSIC

By M. J. B.

IV.

O Music thy celestial claim
Is still resistless, still the same!
And faithful as the mighty sea
To the pale star that o'er its realms presides,
The spell-bound tides
Of human passion rise and fall for thee.
—Moore: "Melologue."

In these beautiful lines the poet exquisitely suggests the relationship of terrestrial to celestial music, which latter is, indeed, older than the history of man, if we adopt the poetic imagery of Holy Job, who speaks of the morning stars, fresh from their Maker's hands, singing together in all the joyousness of their young existence, the praises of the Lord. Addison has suggested the burden of their song: —

Soon as the evening's shades prevail,
The moon takes up the wond'rous tale,
While all the stars that round her burn
And all the planets in their turn
Confirm the tidings as they roll,
For ever singing as they shine
The hand that made us is divine.

The "Harmony of the Spheres" struck the Pagan philosophers many centuries before the Christian era—at all events since the time of Pythagoras—six centuries before Christianity, it was maintainned that their distances and motions corresponded to intervals in music. Even the great Protestant astronomer, Kepler, was imbued with, and defended, this theory.

Hence perhaps Shakespeare's

Look how the floor of heaven
Is thick inlaid with patines of bright gold.
There's not the smallest orb which thou behold'st
But in his motion like an angel sings,
Still quiring to the young-eyed cherubims.
—"Merch. of Venice," v., i.

This is, however, perhaps too far afield for our intermediate education, and we had better not plunge into the science of music. Most ordinary folk, like ourselves, knowing little or nothing about counterpoint or minor thirds, regard music as appealing primarily to the passions. and I venture to assert there is much to be said in favour of this view.

Music! oh how faint, how weak,
Language fades before thy spell!
Why should feeling ever speak
When thou can'st breathe her soul so well!
—Moore: ("Melody.")

Nor is this merely the enthusiastic homage of the Bard to his own art. These sentiments find the support of subtle philosophers from Aristotle to Bacon; of saintly Apostles, from Paul to our own Father Tom Burke; of Popes. from Gregory the Great to Leo XIII.; of Doctors of the Church, from Ambrose and Augustin to Cardinal Newman; of grave writers, from Strabo to Montesquieu; of learned historians from Polybius to Alzog; of warriors, from Alexander the Great to Napoleon; and of crowned heads innumerable, from the Royal David to Carmen Sylva. In fact, to the historical student the influence of music on the passions is very striking, and its influence on "science," as generally understood, so insignificant, as to be scarcely worth considering. We know that in infancy, before we were able to reason at all, we felt the soothing influence of the lullaby; we know that the sacred hymn awakens a new feeling in our breasts, and carries our reason captive and heavenward; we know that the martial strain fires to deeds of derring-do beyond all mere reasoning calculation; the very brute creation feels its power; the milkmaid soothes her restless charge with melody; the war-horse pricks his ears and trembles with generous fire when the clarion sounds the charge; and even the venemous serpent forgets his spleen when charmed to gentleness by the strain of the Indian's reed. What so hackneyed as Congreve's "music hath charms to sooth the savage breast," and in its sorrow the soul finds vent in songs of lamentation and doleful dirges, whilst in its hour of joy or triumph it breaks into pæans and canticles. Thus we see music overpowers reason when it lulls to sleep; carries the soul above mere human reason in prayerful hymns; flings reason and caution to the winds when it fires to war and feats of bravery; allays anger; assuages sorrow; heightens joy; and so controls men's actions through their passions—not their reasoning faculties:

In sweet music is such art;
Killing care and grief of heart
Fall asleep, or hearing die.
—Hen. VIII., iii., i.

Cantabat fanis, cantabat tibia ludis,
Cantabat mœstis tibia funeribus.
—Ovid Fasti., vi., 659.

The inspired writer, to denote the utter desolation of Babylon, tells us that the voice of the harpers and musicians shall be no longer heard therein (Apoc., xviii., 22).

The importance of music is clearly shown in Holy Scripture; where we have the All-Wise Himself dictating to Moses a song which the children of Israel were to sing as a testimony of their allegiance to the Creator (Deuter., xxxi., 19). And we read that homage is paid to the Most High in Heaven itself by songs of praise and adoration, the outpourings rather of grateful hearts than of learned minds. So on all memorable occasions in the historical books of Holy Writ we have songs of praise, thanksgiving, triumph, lamentation. With angelic music was the birth of the Saviour announced to the shepherds: overwhelmed with the awful dignity to which she had been raised, the Blessed Virgin breaks into the canticle: and as the awful moment of agony approached the Redeemer and His disciples send a hymn to heaven before entering the fateful garden.

What more fitted to express Holy Simeon's joy than song? What more touching than the lamentations of Jeremias? And what act other than music could so exquisitely express the adoration, joy, sorrow, repentance, hope, faith, and fear of the royal psalmist?

Paul—the most virile of the apostles—admonishes us, "Be ye filled with the Holy Spirit, speaking to yourselves in psalms and hymns and spiritual canticles, singing and making melody in your hearts." And we know that he practised this lesson himself (Acts xvi., 25).

Paul and Silas, in their prison,
Sang of Christ, the Lord arisen,
And an earthquake's arm of might
Broke their dungeon-gates at night.
—Longfellow: "The slave singing at midnight."

The singers were a part of the ancient priesthood (I. Par., xv., 16, etc.), and the choir is still a part of our Divine service. The great Pope Gregory and the illustrious St. Ambrose regarded music as a most important factor in exciting faith and devotion (1). And in this they have been followed by Councils, Popes, and Doctors to our own day (2).

Of all the great doctors of the Church, I dare say none would be considered more virile —more absolutely free from anything bordering on maudlinism—than St. Augustine, who tells us how profoundly he was affected on first hearing the Ambrosian Chant: "The hymns and songs, O my God, and the sweet chant of Thy Church, stirred and penetrated my being. These voices streamed upon my ears and caused truth to flow into my heart; from its springs the emotions welled up; and lastly tears poured forth, and I rejoiced in tears (Apud Alzog's Ch. Hist., i., 489). St. Basil expressly lays it down: "The Church, in order to excite in our minds tender sentiments of piety, combines with her teaching an agreeable melody, that although unable to understand the words pronounced, our hearts may be lured to a willing captivity in the soft bondage of its delicious sweetness" (apu ibid). The great Charlemagne was not igno rant of the powers of music, nor did he forge in the midst of his empire building to call to his aid (Alzog. ii., 290). Centuries late his great successor, Napoleon Bonaparte, con fessed to Thibaudeau how profoundly the An gelus Bell awakened sentiments of religion i his almost godless breast.

When Luther had cast off his allegiance t Rome, he yet could not tear himself from h church music (Alzog. iii., 391); and in our ow day a distinguished divine, who forsook his cu in the Church of England to join the grea Jesuit Order, sighs for the sweet melody o the old-time even-song—being all that he r grets of what he has abandoned.

It is an old proverb in this country: "It a poor church that has no music," and w learn that even in Pagan times the Druid were also bards. After Christianity had she its light on our island, the Bishops and abbot and saints were wont to carry their harps wit them in their journeys, and tune them t sacred music. The harp of St. Kevin was lon held in special reverence, and the antiphona of Bangor and some of the songs composed b St. Columba have come down to our time. S Columba constituted himself the patron of th bards of Erin, and we have word pictures o him and his monks sitting round the harp whiling away the time listening to melody (3 The most successful missionary of our tim was undoubtedly General Booth; and a suredly music was no small help towards h marvellous achievements. Nor was it among Jews and Christians only that music was highly prized. It was usually part of s Pagan ceremonies. In the Old Testament w have it ordained by Nebuchadnezzar in th worship of the golden calf. The most famous ancient Pagan temples was that of Delphi, ded cated to Apollo, the god of music, and whe from the earliest ages players on the harp an flute were wont to assemble (4). Music, sa Strabo, brings us nearer the gods, and Ov sings:—

Dii quoque carminibus (si fas est dicere) fiun
Tantaque majestas ore canentis eget.

Dr. Alzog, the learned author of "Universal Church History," ascrib the Montanist heresy to the rever and delirium caused by the soft an melancholy notes of the Phrygian flu (i., 233), and in a fine passage Cardinal Ne man warns us against making religion subser music (as is done in many of our fashionab churches—the abomination of desolation stan ing in the holy places), instead of making mus the servant of religion (5).

Father Tom Burke, in his charming lectu on "The National Music of Ireland," relat an incident of the Jesuit mission to Sou America, showing how useful was music converting the savages; and Dr. Alzog relat a similar incident in reference to a mission the Visigoths (ii., 579).

ANCIENT IRISH SOCIETY.

ITS ELEMENTS.

BY THE REV. F. R. MONTGOMERY HITCHCOCK, M.H., B.D.

The social system of the ancient Irish was a most intricate affair and must have frequently exhausted the patience and puzzled the brains of the Brehons, who acted as heralds and registrars. The numerous cliques in the social life of our small community, of which strangers so bitterly complain, doubtless had their origin in the divisions of ancient Irish society. The principles of "fraternity, liberty, and equality" would have been even more revolutionary in the good old days of yore than they seemed when first proclaimed in imperial France. What would the free and independent voters of modern Ireland say to the seventeen distinct classes into which the Celtic tribes were divided according to the Crith Gabhlach?

The organisation of the tribe seems to have been further complicated by the Danish invaders who brought a more elaborate system of society, as well as more approved architectural designs, into the country. Their presence in the country certainly influenced the social life of the Irish by transforming the family life of the tribe more or less into a military system, and by compelling the tribes who had been kept separate by rivalry and jealousy and misrepresentatoin to unite in self-defence. It is, however, as hard to say to what degree and in what special way this foreign influence worked as it is to describe in detail the constitution of the ancient Irish tribe which was already in the course of disintegration when first it emerged into the light of history. At the outset, we may say that it is difficult for us Irishmen of the present day to conceive a state of society in which the individual had no rights, save as a member of his family, in which there was so small an element of property as hardly to qualify a man to say: "Who dare tread on the tail of my coat," and in which there was practically no government of any sort "to be against." The tuath or clan, consisting of people who had sprung from the same ancestor, was the political and social unit. Their band of unity was blood, not land. This cohesion, based on consanguinity, could not be altered by removal or migration from one locality to another. There was little love of their native land in the hearts of the Irish Gaels. In this point they differ from many of us who love our dear old Ireland. But they were deeply attached to their clan and the members of it. The family had no fixed residence; like the Dutch "trekkers," the ancestors of the Boers, they were generally on the move, as their cattle required fresh pasture and as they themselves sought new hunting grounds. The authority was accordingly vested in the father of the family, who, like the Arab sheik, was the patriarch of the establishment, and to whom every member owed obedience. In fact, their safety and welfare depended on their standing by members of the same body and on their compliance with their directions of their common head. The household would not, however, be necessarily limited to the man, his wife, and his children, but, like the Roman familia and the Greek oikos and the Jewish family, would embrace the servants and the slaves, the guests and the sojourners, the relations and armed retainers, who were living with them. Each of these—except the slaves—had their voice in the controlling of the family affairs, and while the constitution was patriarchal in principle, it became democratic in practice. For it was more independent of the father than a modern family is. Now-a-days, when a parent dies, his household is generally broken up, but no such result followed the death of the father of the ancient Irish family. They simply elected another—the most capable, not necessarily the eldest—of his blood relations to take his place, and everything went on just as before. But when land became acquired by the family, as it did in different ways, honest and dishonest, although in theory all land was common, a new system was put into operation, which had the effect of largely extending the family interest. It was called the Geilfine, from Gilla, the five fingers of the hand, and it worked in this way: If the man who acquired the land had as many as five sons, he planted out each of them, as they grew up to be men, in a household of their own, giving them their portion of his property, until he came to the fifth, whom he kept with him as the heir of the original home. Thus the Geilfine, or group of five families, was constituted. Then the youngest, in his turn, planted out his sons upon the residue of his inheritance, keeping the youngest again to be their particular heir. Thus another Geilfine came into being, which was called the Deirbhfine, or "particular group." The process was repeated, and the Jarfine, or "after group," was formed, and then, for the fourth time, a Geilfine was formed, which was the Indfine, or "end group." The reader will notice that there were seventeen households established by this means—four groups of four and the original home. No further subdivisions of land was made after this; but each household became, in its turn, a new centre of four groups, until the number 17 was again reached, and then a fresh start was made. In this system we see how the tribe, in the original sense of the term, was constituted. Bound together by mutual rights and obligations, joining in common worship, and having all things common at the first, the family laid the foundation for that wider though looser unit, the tribe, which in its turn, with many other tribes, helped to form the State.

In the tribe the families were represented by the heads of the households when they met together to discuss any important question. The direct descendants, however, of the original heads of these houses constituted a select class, who exercised certain priestly and military functions in virtue of their high descent, and from these the chief was generally selected. At first the different families, says of the O'Conners, even after the tribe had been fully organised, settled their private arguments among themselves, and seldom or never called in the tribe to adjudicate upon their family quarrels. New developments of the tribe arose when it went forth to conquer their neighbours. In the conquered district the victorious tribe were planted, each family receiving, like the Cromwellians of later days, a due proportion of ground. We here find the germ of the landed aristocracy. Moreover, as a large number of the defeated tribe were taken prisoners and their wives and children, by the newcomers, and as the refugees from the other tribes were naturally received into the service to swell the ranks of the powerful families, most frequently, indeed, of the chiefs themselves, we begin to notice the growth of political power, family influence, and personal wealth—new factors in the onward march of the tribe. For while the weaker families of the same tribe, who were originally on the same footing as the others, sank in the social scale, the numerically stronger would rise in the same proportion.

The principal chief, with his bodyguard of warlike retainers, would stand at the head; then came the great chiefs and their armed followers; then the smaller chiefs and their families, and the free classes, and at the very bottom of the social scale were found the crowd of people who had no civil rights or privileges, although the great majority of them had been the original settlers in the land. But by degrees the social life of the tuath became more complicated, as the element of wealth began to enter largely into the consideration of rank, and as the tuath or tribe, by the addition of other tuaths, began to grow into a small kingdom in which the original freemen of the original tuath were gradually reduced to a position of serfdom or absorbed among the unprivileged class. The Brehons made an elaborate classification of society, according to scale, of which it will be sufficient to give a very bare outline. It appears that the people who resided on the tribe land—which is generally co-extensive with the modern barony—were divided into two principal classes—the Neme and the Feini, the former consisting of those who had a position in the community and the privileges of freemen, the others composed of those less fortunate members of society who had neither rank nor position nor privilege in the tribe. We find a near parallel to these orders in the Roman classification of Patricians and Plebeians, which was, indeed, common to all the Aryan nations.

The higher order, again, was further subdivided into several classes. The lowest of these consisted of men who had a dwelling-house and a portion, no matter how small, of the tribe land. If a farm had a small farm with ten cows he rose one step in the social scale, and if he managed to acquire more stock and was able to keep a few retainers he climbed up the social ladder again and became a noble, a "flaith," having been an "aire" before.

The manner in which the higher classes of the community extended their influence over the poorer, considering the primitive stage of society, was highly ingenious. We must remember that the object desired by the "flaith" order was not merely wealth, but power. And their plan was this. A man's wealth consisted in the number of cows he possessed. There was, however, only a certain amount of the tribe land available for each member. Accordingly, the wealthiest cowowners adopted the expedient of hiring out cows to the poorer graziers, who were glad to have the cattle, for several reasons, pecuniary and social. But the conditions of the loan were worthy of the modern Jew and the ancient Roman, for, if the debtor could not pay his debt he became the vassal of his creditor, whose influence was thus increased by an addition to the number of his retainers. It was in this way that the powerful class of "lords" arose, who claimed to have the right of cosherring upon their tenants, from each of whom they exacted free quarters and support for a certain number of days on their hunting or warlike expeditions. There was, indeed, much to be condemned in the treatment the wealthier classes gave the poorer in those times, which are so often spoken of as the golden age of Erin. For they often compelled them, even against their will, to take their cattle on their own harsh terms, in order that they might have a safe investment at the risk of their weaker brethren, at whose free-

dom they thus aimed a deadly blow, with a view to their own aggrandisement, for it was the acquisition of these personal rights over their debtors that constituted the distinction of the "flaith" or highest order of the community. The lowest class of "flaiths" was called the aire-desa, i.e., a free man who had the right of hiring out cattle. And, naturally enough, in their desire to rise higher, they all took advantage of this law, which oppressed the poor.

It is commonly but wrongly supposed that property formed the only basis of rank among the Irish, for though there was a fixed property qualification for the higher grades, unless that property was retained through three successive generations, grandfather, father, and son, the rank was lost. It was that custom, no doubt, which gave rise to the familiar saying that "it takes three generations to make a gentleman." The Geilfine system, which has been explained, was, doubtless, invented to meet this regulation by securing the retention of the property in the family.

The privileges of the community, which were enjoyed by the upper classes of "flaiths" and "aires" and were denied to the lower class of "frini" consisted of sitting in the assembly, of giving asylum, and of representing those under their protection. Here was another means cleverly devised by the more influential members of the community for extending their power. For it stands to reason that the tie between them and their retainers who could not even sue a member of the higher order who had injured them, unless accompanied by their patron, was bound to become a very close one indeed.

The law of evidence also bore heavily upon the members of the lowest class. For their testimony was not accepted. It was these laws and customs that helped to break up the unity of the tribe and kingdom. And while the great man with his vassals and retainers, who consisted largely of foreign mercenaries, refugees, and the original inhabitants of the land, oppressed the poorer members of his own tribe, the latter were compelled to combine for protection. And thus there arose a system of guilds in the land. Guild, said to come from a Celtic word, giall, signifying pledge. A guild meant a co-partnership in labour. According to the Brehen law, guilds were for the mutual benefit and assurance between copartners. The candidate for membership in a guild had to pledge himself that the responsibility of the body should be his. The people of the lower ranks were thus rendered more secure against their political enemies and their own political status was raised. For example, with regard to the giving of testimony, a right denied to the poorest man individually. Several poor men by combining together could qualify one of their guild to represent each member of the guild in a law suit. By this method artizans, handicraftsmen, and swell graziers had some one to represent them individually and to see that they were not wronged by the richer members of society. By this system the personal rights of the poorest were secured, and trade and labour were protected from the tyrannical encroachments of the chief and his alien crew of fighting men, on the one side, and from the cruel oppression of the wealthy on the other. But it is easy for anyone to see at a glance that the elements of disruption were even now at work in the State. For a kingdom divided against itself cannot stand. Between the chief, supported by his foreigners or fuidhirs, and the wealthy classes, backed by their retainers and vassals, the labouring class came to the wall, and the tribe soon followed them. For even the mighty power of Rome was undermined and went under when it allowed such an absurd and cruel state of affairs to exist. From a glance at the constitution of ancient Irish society we may safely infer that the greatest pledge of welfare and prosperity that our country possesses at the present hour lies in the protected and improved condition of the working and farming classes.

PRE-COLUMBIAN DISCOVERERS.

IRISH VOYAGERS VISITED AMERICA CENTURIES BEFORE THE GENOESE.

Dr. B. F. De Costa, in his interesting book, "Pre-Columbian Discoveries of America," insists that attention must be given to the activity of the early Irish voyagers. Broughton brings forward a passage in which St. Patrick is represented as sending missionaries to the isles of America. Allusions in the chronicles of the Northmen refer to a distant land, spoken of as "Ireland the Great," which must have been America. The Irish in the early times might have easily passed over to the Western Continent, for which voyage they undoubtedly had the facilities.

Professor Rafn, after alluding to the well-known fact that the Northmen were preceded in Iceland by the Irish, says that it is by no means improbable that the Irish should have also anticipated them in America. The Irish were a sea-faring people, and have been assigned a Phœnician origin by Moore and others who have examined the subject. If this is so, the tradition would appear to be strengthened. Even as early as the year 296 the Irish are said to have invaded Denmark with a large fleet. In 396 Niall made a descent upon the coast of Lancashire with a considerable navy, where he was met by the Roman, Stilicho, whose achievements were celebrated by Claudian in the days of the Roman occupation of England. At that period the Irish were in most respects in advance of the Northmen, not yet having fallen into decline, and quite as likely as any people then existing to brave the dangers of an ocean voyage.

The first Scandinavian settlers in Ireland did not find this barren country entirely destitute of human beings. Ari Frode, than whom there is no higher authority, says: "Then were here Christian people whom the Northmen called Pa Pas, but they afterwards went away because they would not be here among heathens, and left behind them Irish books and bells and croziers, from which it could be seen that they were Irishmen."

The monks or Culdees, who had come hither from Ireland to be alone with God, took their departure on the arrival of the heathen followers of Odin and Thor, and the Northmen were thus left in undisputed possession of the soil.

After the conversion of Ireland and the death of St. Patrick, near the end of the fifth century, the Irish religious went far and wide. (Cormac the navigator, an Irish monk, discovered Iceland. See Joyce, p. 213.) The Irish Christians retired to Iceland at a very early day. The Irish monk, Dicuil, also refers to this solitary island, which about the year 795 was visited by some monks with whom he had conversed. In this connection the results of the Danish invasion of Ireland should be considered, since that may have resulted in driving men to both Iceland and Greenland.

In connection with Greenland the investigator seems to stand on more solid ground. Christophessen declared that Greenland was discovered in the year 770, and Pontanus gives a bull of Gregory IV., 835, which shows that both Iceland and Greenland were known at that period. Yet it is generally understood and laid down that Eric the Red first led colonists into those parts. We have seen, however, that Eric, in 983, went west in search of the land found by Gunnbiorn in 876, while the Sagas admit that the Irish were in America before the men of Iceland reached that country. Turning to the minor narratives towards the end of this volume (the "Pre Columbian Discoveries") the reader will find the story. The Irish, through Ralf, the Limerick merchant, reported one Are Marson, an Icelander, as held a prisoner in a country at the west, called "Ireland the Great." He was among Christians, apparently, as he had been baptised there. In 931 Marson was a well-known man in Iceland. He went on a voyage and disappeared, but was found later. On the spread of the missionaries and monks following the conquest of Ireland by St. Patrick, Irishmen probably found their way to Greenland and parts of the mainland of America, as they did to Iceland. The fact that we have only vague and shadowy reports of their actions have nothing to do with the reality of the explorations. In denying these reports men simply make their ignorance a basis for belief. The early days of America, no doubt, were marked by much maritime adventure that has left no record. . . . . On an island to the west of Cape Cod they (the Ericcsons) found a corn barn constructed of wood. A building of this character would point to Europeans, probably Irish, who, according to the minor narratives, preceded the Irish in America, named by them "Ireland the Great."

It is perfectly clear that there was a country somewhere on the Atlantic coast of North America known as Whiteman's Land or Ireland the Great. It is equally clear, from Icelandic testimony, from the bull of Pope Gregory IV., 835; from the letter of Pope Nicholas V., 1448, and Christophessen, that Europeans were in Greenland prior to Eric the Red, 985. Nor can there be a reasonable doubt that the Irish were in America prior to Eric. There is a truth behind the story of St. Brendan, told in so many ancient manuscripts. One day additional light will be thrown upon the story of Are Marson, and a better understanding must ere long be reached respecting the early social and commercial relations that existed between Ireland and Iceland.

The fact that Are Marson is said to have been baptised in Ireland the Great does not prove that the place, wherever located, was inhabited by a colony of Irish Christians. Yet this view was urged by Professor Rafn and others, who held that Great Ireland was situated in Florida. A Shawanese tradition was given to prove that Florida was early settled by white men from over the sea. We read that in 1818 "the Shawanese were established in Ohio, whither they came from Florida. Black Hoof, then eighty-five years old, was born there, and remembered bathing in the sea. He told the Indian agent that the people of his tribe had a tradition that their ancestors came over the sea, and that for a long time they kept a yearly sacrifice for their arrival.

Like the Irish, who for nearly two thousand years have proved themselves a literary people, the Icelanders have shown their devotion to intellectual efforts along legitimate lines, and it is in the Icelandic literature that Dr. De Costa and others have found evidences of the Irish discovery of the American continent. It is not at all unlikely that these clues may be supplemented some time by the profitable researches of Gaelic scholars among the old Erse manuscripts still in untranslated existence, and which may prove to the most confirmed skeptic that America was really Ireland the Great eight centuries before Columbus and Cabot rediscovered the long-lost half-world.

The stunted trees and shrubs of the Japanese have been the wonder and envy of the gardeners the whole world over. But a German chemist now comes along and does something which even the Japanese could hardly be expected to do. He has prepared a fluid that has the power, when injected into the tissues of a plant, near its roots, of anaesthizing the plant. As a result of this injection, the plant does not die, but stops growing, maintaining its fresh green appearance, though its vitality is apparently suspended. Changes in temperature seem in nowise to affect the foliage, for the plant blooms in the open as well as in the most carefully constructed hothouse. As might be expected, the composition of the fluid is shrouded in the greatest mystery.

IRISH TRAVELLING BEFORE RAILWAYS.

A CANAL FLY BOAT.

Mr. and Mrs. S. C. Hall in their well-known work "Travels in Ireland" wrote as follows with reference to the scene despicted above:—

"We entered the county by the Royal Canal, voyaging part of the way in one of the 'Fly-boats,' to which we have already made some reference, and to which we recur chiefly in order to supply the reader with a pictorial description of the singular 'conveyance.' It is here represented passing under one of the bridges, in the suburbs of Dublin." [The particular bridge shown in the picture is that which crosses the Grand Canal at Clanbrassil street—Ed. D. P. J.] "It is long and narrow, covered in as we see it; and there are two divisions for different classes of passengers. As a mode of travelling, it is exceedingly inconvenient; there is scarcely space to turn in the confined cabin; and an outside 'berth' for more than one is impossible. The guide, or guard, takes his stand at the bow of the boat, and a helmsman controls its motions. It proceeds at a very rapid pace—about seven Irish miles an hour—drawn by two or three horses, who are made to gallop all the way. There is also a more cumbrous vessel, called a 'night-boat,' which travels at a much slower rate—about four miles an hour—and always at night. It is large, awkward, and lumbering, and is chiefly used by the peasantry on account of its cheapness."

THE HISTORY AND ANTIQUITIES OF THE CITY OF DUBLIN.

FROM THE EARLIEST ACCOUNTS:

Compiled from Authentick Memoirs, Offices of Record, Manufcript Collections, and other Unexceptionable Vouchers,

By THE LATE WALTER HARRIS, ESQ. WITH AN APPENDIX.

Chapter IV.

Some observations on the ancient buildings, streets, lanes, and alleys within the walls of the city of Dublin; and what alterations they have received from time to time.

Sect. I.

The buildings of the city of Dublin, like those through other parts of the kingdom, were anciently mean and contemptible, erected of wattles daubed over with clay to keep out the cold, and covered with sedge or straw. The Danes, who fortified the city, applied their labours to make it defensible, and not ornamental; nor could this latter circumstance be expected to be considered by a people engaged in perpetual wars, undefended by laws, and in a flitting, shifting condition, ready to make room for the first powerful invader. The arts of peace, and the protection of laws, can only inspire the notions of making solid and comfortable settlements. It was of such rude materials that king Henry II., either out of necessity, or in conformity to the fashions of the country ("ad modum patriæ illius, as Roger Hoveden (1) expresses it), erected a royal palace with uncommon elegance ("miro artificio"), of smoothed wattles, in 1172, in which his majesty, with the kings and princes of Ireland, solemnised the festival of Christmas. The introduction and establishment of English colonies in Ireland, gradually introduced commerce, and the consequences thereof, wealth and politeness, which was followed by an al-

(1) Anal. pars posterior, p. 302, edit. Saville 1596.

teration for the better in the buildings of the city; insomuch that both before and in the reign of queen Elizabeth, the citizens fitted up their houses in a more durable and convenient form, namely, of timber built in the cage work fashion, elegantly enough adorned, and covered with slates, tiles, or shingles. Several of these houses erected in that queen's time, as well as in the reign of her successor, have subsisted till of late years, and one particularly in (2) Cook-street was totally demolished on the 27th July, 1745, to make room for new houses. On an oak beam carried over the door the whole length of the said house, was the following inscription cut in large capitals, and a fair Roman character, nothing damaged by time in the space of 165 years, except in one part, where an upright piece of timber being mortified into it, had received the drip, and was somewhat rotted.

QUI FECISTI COELUM ET TERRAM BENEDIC DOMUM ISTAM, QUAM JOHANNES LUTREL ET JOHANA —— NEI CONSTRUI FECERUNT A.D. 1580, ET ANNO REGNI REGINÆ ELIZABETHÆ 22.

Thou who madst the heavens and the earth bless this house, which John Lutrel and Joan —— caused to be built in the year of our Lord 1580, and in the 22d year of the reign of queen Elizabeth.

It is no way improbable that John Luttrel, who was sheriff (3) of Dublin, in conjunction with Gyles Allen, in the years 1567 and 1568, was the builder of this house.

Next door to the former lately stood a large and stately cage-work house, with this inscription over the door in Roman characters,

ROBERT EUSTAC, AN MANNING, 1618.

This Robert Eustace was sheriff (4) of the city in conjunction with Thomas Allen in the years 1608 and 1609.

In a lane leading from Cooke-street to Merchant's-quay, called Rosemary-lane, part of the wall of an old cage-work house stands, over the door whereof, cut in timber, are two escutcheons of arms, and between them a date, 1600, with the letters E. P., which may be conjectured to stand for Edmund Purcell, who two years before was sheriff (5) of the city in conjunction with John Brice.

An old cage-work house in Big-butter-lane, without the city, wherein brigadier general Borr lately lived, and is still the property of one of the name and family. It was in the year 1641 the house of Sir Francis Willoughby, a gallant and experienced soldier, where he resided upon the breaking out of the rebellion, but left it to take on him the government of the castle to which he was advanced by the order (6) of the lords justices.

(2) At the corner of Skipper's-lane in Cook street, at the west side.

(4) Ibid.

(5) Catalogue of the mayors and sheriffs of Dublin.

(6) Temple's History of the Rebellion, p. 47. Borlases's History, p. 27.

Several cage-work houses now remain in Patrick-street, without the walls of the city, which carry the face of antiquity; but as there are no dates visible on them, it is not possible to fix their ages. Among these there is one with this inscription, VICTORIA MIHI CHRISTUS A. I., the last letters of the name with the date being defaced.

A large house of the same form in Fishamble-street (7), many years inhabited by Mr. Pattin, a victualler, has on the front of it two coats of arms, one of Plunket, the other of Plunket empaled with his wife. From whence it may be probably concluded that some person of that family erected the said house, though (according to tradition) it was afterwards inhabited by the Anglesey family.

But the oldest house of this sort now subsisting is (for what appears, there being no date to aid an inquiry) that in Skinner-row, near the Tholsel, in a part whereof Dick's coffee-house hath been for a long time kept. It was called the Carbrie, and appears by history (8) to have been inhabited by the earl of Kildare two hundred and thirty-two years ago, and how much longer we know not. "For in the year 1532 the lord-deputy Skeffington, being displaced, was by his successor, Gerald earl of Kildare, suffered like a mean private person to dance attendance, among other suitors, in his house in Dublin, named the Carbrie." This house is called by the said name of Carbrie in ancient leaves from that noble family, still subsisting, though upon the misfortunes attending it after the rebellion of Thomas Fitzgerald in 1534, it changed its proprietor, and was inhabited by the earl of Ormond (as tradition says) until the restoration of the earl of Kildare to the estate and honours of his family, the first by king Edward VI., and the latter by queen Mary. In the 11th of Elizabeth, it became again the property, and, for a time, the habitation of that family.

Several of these kind of houses are yet to be seen in Castle-street, High-street, the Wood-quay, Thomas-street, and other parts of the city and suburbs; but it is sufficient particularly to mention the foregoing. We shall conclude, therefore, this head with two general observations. 1. That before and during the reigns of Henry VIII., Edward VI., Mary and Elizabeth, most of the buildings for habitation here were of the cage-work fashion, and only castles, towers, churches, monasteries, and other buildings appropriated to religious or charitable uses, were built of lime and stone. 2. That it may be doubted, from what has been said, whether any of the thin modern buildings will continue for so long a period, as some of the cage-work houses before mentioned have done

Sect. II.

In the reign of king James I., upon the settlement of the nation after the rebellion of the earl of Tyrone, the inhabitants of Dublin began to build their houses of lime, stone, or brick, and to cover them with slates or tiles, after a more elegant and convenient form that the cage-work houses before mentioned. The same fashion continued and was improved in the reign of that monarch's son and successor, and has been handed down with some variation to this time. None of the houses built here in the reign of the former of those kings subsist to this day, that we know of, at least, there are none that betray their ages by any inscription or date. Some of the houses built in the reign of king Charles I. remain, (9) particularly a large one in Winetavern-street, opposite to Cooke-street, which shows some elegance in the structure, and has on the front an escutcheon containing a coat of arms, on one side of which, on a tablet, are inserted these letters, R. M., and another tablet on the other side containing the date of the building (1641).

(7) Bull's-head.

(8) Stanihurst's Continuation of the Chronicles of Ireland, published by Holingshed, p. 87.

Sect. III.

The face of the city of Dublin, both within and without the walls, has been much changed since the reign of queen Elizabeth. Within the walls several streets and lanes have been totally annihilated, while otehrs have only changed their names, amny whereof are to be met with in ancient records, which would puzzle one how to fix. Of the growth and increase of the city without the walls, we shall take occasion to remark something in the next chapter.

From the bowed part of Fishamble-street, near the place where the music-hall at present stands, to Castle-street, formerly extended a lane called Cow-lane (10), which is now totally shut up by buildings, and the large, elegant structure at the corner of Fishamble-street and Castle-street, now inhabited by Mr. Bond, tobacconist, built by Sir Daniel Bellingham, the first lord mayor of Dublin, and wherein he kept his mayoralty in 1665 (11), was erected across that lane, which in the mayoralty of Nicholas Weston, in 1598, was set to farm by the city to John Weston, and many houses built on it, and almost as many contests had for the property of the ground in the courts of law.

Another lane formerly ran at the back of Skinner-row, from Nicholas-street to Werburgh-street, which is now also totally shut up by private buildings; at the end whereof in Werburgh-street, in the last century, stood (12) the prison of the four court marshalsea, which being removed to another place, a fair house was built in the room of it (13), inhabited by Mr. Crofts, deputy clerk of the Tholsel, about the year 1678.

This lane is called in a record of 1422 Hynd-street, alias Souter-street, the former of which names was probably technical, as it was carried behind one of the principal streets of the city, and the latter

(9) The front of this house was taken down and re-built in the year 1760.

(10) Ware's MS.

(11) Catalog. ut supra.

(12) R Ware, MS.

(13) At present the Phœnix-tavern.

(since called Sutor's-lane) it had from its being the habitation of many shoe-makers during its existence. It is mentioned under the name of Vicus Sutorum in the black book (14) of Christ-church, Dublin, and is the same which Richard Stanihurst (15) in the reign of queen Elizabeth calls St. Verberoffe's-lane, i.e., St. Werburg's-lane; describing it to stretch from St. Werburgh's-street to St. Nicholas-street, and which was, when Hollingshed published the said treatise of Stanihurst in 1586, enclosed.

Another lane formerly subsisted, called Austin's-lane (16), extending from Austin's-gate in Sheep-street, before mentioned in cap. III. p. 72, to Castle-street, which is now also totally employed in buildings, on a part of which the house of Sir James Ware stood in the last century; in the room whereof the buildings composing Hoey's-alley (17) were afterwards erected.

Preston's-inn hath lost its name these many years. It was a large space of ground opposite to Castle-gate, bounded (18) by the castle ditch, the city walls, extending from Dame's-gate to Isod's-tower (on the site whereof Essex-gate was afterwards erected), Scarlet-alley, called also Isod's-lane, and now the Upper Blind-quay, Smock-alley or Smoke-alley, and so up to Castle-street. On this void piece of ground a party, sent (19) by Thomas Fitzgerald in 1534 to besiege the castle, planted their batteries, and which since that time has become the properties of divers persons. Cork-house, now Lucas's coffee-house, the old exchange, and the adjoining houses, were erected on a part of it; a part of it was occupied by Copper-alley (which took its name (20) from the copper money there coined and distributed by the Lady Fenton, widow of Sir Geoffrey Fenton), another part of it has been taken up by a range of buildings extending from Copper-alley to Castle-street, and the remainder, opposite to Cork-house, became the property of the lord chief baron Bysse, and Sir Dudley Loftus, and was what in latter times remained under the denomination of Preston's-inn, until it changed its name to the lord chief baron's yard, on which the said chief baron Bysse erected a fair house, which was demolished in the year 1762 with other buildings, when Parliament-street was opened, in which it stood.

Geneville's-inn hath also lost its name, for the situation whereof see in the foregoing chapter. The same may be said of Tullock's-lane, which ran from the end of Fishamble-street to the Wood-quay, and is now understood to be a part of the Blind-quay, properly so called. It derived its name from St. Olave's, corruptly called St. Tulloch's or St. Doolach's-church, which stood close to it at the end of Fishamble-street. This lane is mentioned by Stanihurst (21).

(19) Descrip in Hollingsh. p. 92.
(20) R. W. MS.
(21) Descrip in Hollingsh. p. 23.

Vicus Figulorum, or Potter-street, is mentioned in a record of 23 Edw. III. (1348) to lie within the city, and in another record of 30 Edw. III (1355) Vicus Siccorum is said to be in the parish of St. Nicholas. We can find nothing remaining of either of these streets at this day; and, therefore, if they have not changed their names, they must have suffered the same fate with those before mentioned, and have been shut up by buildings erected on them.

Stanihurst (22) takes notice of Giglottes-hill, but does not describe its situation. The word signifies a wanton woman; and possibly the the place took its name from being the resort of such. If it be not called Cock-hill at this day, extending from Michael's-lane to the upper end of Wine-tavern street, it has eluded our searches.

Fishamble-street is said by some (23) to have been anciently called Bough-street, "either from the wattles or boughs of trees, with which it was at first built, or from the custom of the country butchers (for whose use, they say, this street was at first appointed) in setting off their shambles with the boughs or branches of trees;" and they further allege "that it has since changed its name into Fishamble-street, the country butchers having been removed from thence in the last century, and the fish-market then established there." But we can by no means subscribe to this opinion; because in a record so early as the 19th Richard II. (1395) it is called Vicus Piscatorious in parochia Sancti Johannis"—"Fish street in the parish of St. John." So that if ever it bore the name of Bough-street, it was since the date of the before cited record; or if it had a name in any wise resembling that, it may be probable it was called Bow-street, from its crooked form like a bow, which it has at this day. It is called by an historian (24) in the reign of queen Elizabeth, St. John's-street, alias Fishamble-street. The flesh-shambles stood then in High-street, as will be seen hereafter.

Skinner-row, or Skinner-rue, i.e., the street of the skinners, is called by that name, with an alias, Boath-street, in a record of 20 Hen. VI. (1441), and is described by Stanihurst (25) to extend from the pillory to the Tholsel, or to the High-cross, the former standing where the end of that street is intersected by Werburgh-street, and Fishamble-street, and the latter at the end of High-street, where that and Skinner-row are intersected by Nicholas-street and Christ-church-lane.

St. Michael's-lane, so named from the adjoining church of St. Michael, is called in the black-book of Christ-church, Gille-mcholmoch's-lane, from a sept of that name in the neighbourhood of Dublin, the petty prince of which joined the English in their first invasion; of whose fidelity Maurice Regan gives an ample account in his history (26). In the year 1207 king John granted to Dermod Fitz-Gilemoholmoch a burgage in Dublin, and fifteen carucates of land in the vale of Dublin (i.e., in Fingal), to hold by the service of one knight, and two otter-skins, to be paid annually into the exchequer. It is probable that the burgage stood in this lane, which took its name from the grantee.

(22) Descrip in Hollingsh. p. 23.
(23) R. W. MS.
(24) Stanihurst ut supra.
(25) Ibid.
(26) Published in the Hibernica, part I.

Rochel-lane, called in the ancient records of Christ-church, Vicus Rupellæ, and Vicus de la Rochel, had its name from the Rochel merchants inhabiting there, and extended from St. Nicholas-street to Corn-market E. and W. on the south side of the flesh-shambles, which before and in the reign of queen Elizabeth (27) were kept in High-street; and upon their removal in the reign of king James I. a range of buildings was erected, and joined to those which formed the north side of Rochel-lane, which from its course on the back of High-street, took the name of Back-lane, by which it is known at this day.

The street extending from New-gate to St. Audoen's-church was anciently called (28) New-gate-street, and is so mentioned and described by Stanihurst, but has since taken the name of Cornmarket, being the place where grain was exposed to sale; till of late years that market was removed to Thomas-street, and a spacious and convenient edifice erected for the purposes of dealers in that kind. The corn market, notwithstanding, still retains its name; though it is now chiefly employed as a market for coarse linens. In the opening of this street from High-street, anciently stood the High-pipe built to supply the citizens with water by John Decer in the year 1308, who was mayor of Dublin that year and the year following. Another pipe stood in High-street opposite to the entrance into Michael's-lane (29).

School-house-lane is called also Ram-lane by Stanihurst (30), and extends from High-street to Cook-street (31), parallel with Michael's-lane before mentioned.

Of Frapper-lane, mentioned by Stanihurst (32) as lying within the walls, we know nothing. The same writer mentions Scarlet-lane, alias Isod's-lane, without describing its situation; and as he has omitted taking any notice of the Blind-quay, which extended from Isod's-tower, before described, to the end of Fishamble-street, E. and W., this probably in his time passed under the name of Scarlet, alias Isod's-lane.

These are all the streets and lanes within the walls of the city that occur to us either to have lost existence, or to have changed their names. For our defects, we must make the apology Pliny did upon the like occasion. "Ardua res est vetustis novitatem dare, obsoletis nitorem, obscuris lucem, dubiis fidem—It is a difficult task to give the appearance of novelty to old

things, to cast a lustre on matters gone out of use, to raise light out of obscurity, or to give certainty to things doubtful."

(To be Continued.)

ORIGIN OF PROPER NAMES.

What is the origin of the proper name. Did it exist among the Greeks, among the Romans, and formerly among the Hebrews? The Jews, who, however, had a perfect comprehension of the family, knew nothing of the transmission of names. The Greeks knew no more. Some adopted the name of an ancient celebrity, but these surnames were transmitted without any order, and without any fixed rule. The Romans were the first people who appreciate the utility of establishing relations between the ancestor and the diverse members of the same family, and to bind them by common and tangible tie. With them it was above all a question of prolonging the fame of eminent patricians, of creating an elite, or that which was later called an aristocracy. Names became hereditary in Rome from the year 500, but for the patricians only.

The heredity of names was not introduced in France before the eleventh century, and solely for the nobles. The feduality having made of the earth the base of social organisation, it was from the earth that the possesor a fief drew the name which bound together his family. In this way it perpetuated in the direct line the honours, the wealth, and the fame of that which was frequently the recompense for services rendered the King, and it assured the possession of the fief to the younger in case of the extinction of the older branch. The French noble took his name from the earth. In Rome the patrician gave the names to his domain (Fundus Corneliansus). The Roman patrician held his position and power from the patrician. The seigneur in France held his possessions solely by virtue of the services he must render, the victories he must obtain, the expenses he must pay; he acquired a large part of the grandness from the importance of his fief. He is important by virtue of the earth. And as this earth has made him powerful, rich, and strong, he took from it his name, for it is the name of the earth, the source of his nobility and of his fortune, which it is proper that he should perpetuate. However, some preferred to take the name of a great ancestor. Since the eleventh century it has become nearly possible to recognise in the filliation the proper names of families. Up to this time all is confusion.

Among other nations many ignore to-day the transmission of names. If the Chinese have adopted it for a long time, the Arabs, the Persians, and the Turks have not dreamed of it. Many European people are in a period of transition. Among the Greeks all the names terminate in poulo, among Servians all terminate in itch, among the Roumanians in esco or eanu. Example—Nicolopoula (son of Nicholas), Payvitch (son of Paul). In Polish we have the ski, the off and eff in Russian, etc.

Proper names born in France in the eleventh century and in the fifteenth century were protected by the law, became titles of property for the common people as well as for the noble.

The experiments upon the Berlin-Zossen high-speed electric railroad have come to an abrupt and unsatisfactory conclusion. It was originally anticipated that the special car built for the purpose would attain a speed of 125 miles an hour. A velocity of only 100 miles an hour was reached, however, and that only for a brief space of time. The effect of this high speed upon the track was so destructive that the attempt to make higher speeds was discontinued. The Berlin-Zossen military track was practically a straight line, so that the experiments, even if successful, would not have substantiated the possibility of running trains safely round sharp curves at these terrific speeds on a two-rail track.

AN UNPUBLISHED POEM,

By DEAN SWIFT.

WITH A LETTER OF GERALD GRIFFIN.

The following letter and the poem it encloses were sent by Gerald Griffin to the Editor of the "Dublin Literary Gazette":—

Limerick, April, 1830.

Sir.—I send you an extract from an unpublished poem, by Dean Swift, now in my possession. It was placed in my hands by a lady who resides in the County of Clare; and had been discovered amongst the papers of the late Bishop Bernard, of this city, whose intimacy with the great satirist is well known. It bears the Dean's own signature, and from the date (September 7th, 1728) which he has prefixed, (as he was in the habit of doing to many of his light pieces), I conclude that it was written when Swift was residing at Market Hill (the seat of Sir Arthur Acheson). His letters, and the journal to Stella, contain several allusions corroboratory of the genuineness of the poem, as will appear from a perusal of the few notes I have subjoined to the extract. The little piece may not be thought in his best vein, yet it bears the stamp of his spirit in a sufficient degree to make what is called the internal evidence of its paternity abundantly conclusive, and the irony in part is exquisitely subdued. It appears to have been written with the view of dissuading his friend Lindsay from embracing the legal profession; and the extract which I give presents a sketch which is graphic at least, although the portrait is viewed through a mischief-making medium. He is banteringly defending the cause of the profession against those who say that the lawyer's money is easily earned, and lends his satire (like Mr. Candour's scandal) the veil of charity. I preserve exactly the spelling and punctuation as they are in the original:—

THE LAWYER.

I own the curses of mankind
Sit light upon a Lawyers mind
The Clamours of Ten Thousand Tongues
Break not his rest, nor hurt his lungs,
I own his conscience allways free
(Provided he has got his fee)
Secure of constant peace within,
He knows no Guilt who knows no sin.

Yet, well they merit to be pity'd
By Clients always overwitted:
And tho' the gospel seems to say
What heavy burdens Lawyers lay
Upon the Shoulders of their Neighbour,
Nor lend a finger to the Labour,
Always for saving their own Bacon;
No doubt the text is here mistaken
The Copy's false, or sense is rackt;
To prove it, I appeal to fact,
And thus by demonstration shew
What burdens Lawyer's undergo.

With early Clients at his Door
Tho' he was drunk the night before,
And crop-sick with unclub'd for wine
The Wretch must be at Court by nine,
Halt sunk beneath his Briefs and Bag
As ridden by a midnight Hag:
Then from the Bar harangues the Bench
In English vile, and viler French,
And Latin vilest of the Three
And all for poor Ten Moydore's fee—
Of Paper how is he profuse?
With periods long in terms abstruse,
What pains he takes to be prolix?
A thousand lines to stand for six;
Of Common Sense without a word in:
And, is not this a grievous burden?

The Lawyer is a Common Drudge
To fight our Cause before the Judge;
And what is yet a greater Curse
Condemn'd to bear his Client's Purse,
While he at ease Secure and light
Walks boldly home at dead of night;
When Term is ended leaves the Town
Trots to his Country Mansion down,
And disencumbered of his Load,
No danger dreads upon the road,

Despises Rapparees and rides,
Safe through the Newry mountains' sides.
Lindsay 'tis you have set me on
To state this Question pro and Con
My Satyr may offend tis true,
However it concerns, not you,
I own there may in every Clan
Perhaps be found one honest man;
Yet link them close, in this they Jump,
To be but Rascals in the lump.

In the conclusion of the poem (which, even in the sketch just given, presents some touches of that shade of sober irony which has immortalised the Academy of Lagoda), the Dean grows personal; and concludes with a joke at his old acquaintances, Carter (the Master of the Rolls), Richard Tighe, and Connolly, to whom Lord Wharton was charged with having sold the place of a Privy Councillor, and Commissioner of the Revenue, and who was afterwards Speaker of the Irish House of Commons, and a Lord Justice. Robert Lindsay, to whom the poem is addressed (and whose name it bears in the title), is often mentioned with affectionate regard in the Dean's works; and is, I believe, the same to whom, in the will of Esther Vanhomrigh, we find the sum of £25 bequeathed to buy a ring.

I will add, Sir, that I feel a great satisfaction in being able to forward so valuable a contribution to the "Dublin Literary Gazette"—being the first attempt for a long time to revive what the brilliant writer immortalised—the local literature of Ireland.

I am, Sir, your obedient servant,

THE AUTHOR OF THE COLLEGIANS.

LIVES AMONG GRAVES.

One solitary inhabitant has San Nicolas. Once an island of perpetual summer, smiling valleys and rich-watered slopes, it is now a bleak desert of sand, an island of bones, without verdure, without water, storm-swept and cursed. Mariners avoid it and know it for the most inhospitable spot off the western coast of America.

This blighted isle lies opposite southern California. Nearby is Santa Catalina, now what San Nicolas once was, a modern Araby, blessed with soft winds and a teeming soil.

San Nicolas was recently visited by Professor Charles F. Holder, formerly member of the United States Fish Commission, who was thrown on its shores by a hurricane that wrecked his schooner. He found an island about seven miles long and four or five wide, a picture of desolation, a spot given over to the furies and devastated by sand, which is filling up the canyons, and constantly changing the aspect of the place.

A vast mound tells the story of the ancient inhabitants of the island. It is 15 or 20 feet high and made up of abalone shells; bones, fragments of human skeletons, broken mortars, pestles—the remains of a race which might have been blown into the sea as far as appearances go.

Where verdure, trees, and springs have succumbed to the elements one man remains in defiance of them. He is a Basque, speaking not a word of English, and relying on being satisfied with two wolf dogs and the cormorants for society. A wild woman had been his predecessor. She had lived on the stricken spot for years, despite all efforts to capture her. The present inhabitant knows nothing of the world's movements.

On quiet days the sand ripples like waves over the surface of the island. On stormy days it rises like clouds, whistling and whirling through the air. Day by day, almost the face of the island is changed, but ever on top remain the ghastly skulls of which there are miles.

The antiquity of the race once inhabiting the island is evident. They were buried usually with all the implements of their calling, and Professor Holder uncovered several graves of great archaeological value. The abalone shells are of large size, never found elsewhere to-day, and practically extinct. What produced the extermination of these people is not known; but to-day the wind-swept isle is one of the most interesting archaeological storehouses of America.

THE DANE'S CAST.

Lewis (Topographical Dictionary of Ireland, vol. ii., p. 546) says:—"In the demesne of Scarvagh is the 'Danes' Cast,' by the native inhabitants known by the name of Gleann na muck duibhe, or 'the glen of the black pig'; it is principally composed of earth, and resembles the Roman wall in Scotland, and Offa's dyke in North Wales; its course is nearly north and south; in some places it consists of a single foss, which gives the appearance of a double foss and rampart. It is supposed to extend from Lough Neagh to the sea, near Dundalk, but it is nowhere so well preserved and unbroken as in this neighbourhood; it traverses southward through the demesne of Union Lodge, where it is a single rampart and foss, the rampart being here faced with stone, and it so continues to the unclaimed ground of Loughadian; northwards it entered towards the fort of Lisnagade, terminating at a stream that forms the boundary between the townlands of Scarvagh and Lisnagade. Lisnagade, 'or the fort of the hundred,' is one of the most extensive and best preserved of its kind; it consists of treble ramparts and entrenchments; the entrance is from the east, leading into an extensive circular enclosure, whence are obtained prospects of the entire country for many miles around, and a great number of forts or raths are seen, from which circumstance it is supposed this fort took its name, being the chief of a hundred others; the fosses on every side are very deep, and it is remarkable that they are all paved at the bottom with rounded pepples set in clay. In cleaning the fosses, in 1832, Mr. Trevor found a great many silver coins, a brass cauldron, spear-heads, and other relics of antiquity. Great numbers of arrow and spear-heads of flint, stone and brass celts, and other military weapons have been found in almost every part of the cast."

Dr. O'Donovan ("Book of Rights,' p. 36-7), says "Uladh (1) was originally the name of the entire province of Ulster, but after the year 332 it was applied to that portion of the east of Ulster (Down and Antrim) bounded on the west by the Lower Bann and Lough Neagh, and by Gleann Righe, through which an artificial boundary was formed, now called the Danes' Cast. This boundary is distinctly referred to in a manuscript in the Library of Trinity College, Dublin, H. iii., 18 p. 783, in the following words:—'Do'n taobh abhus do Gliond Righe do righnead torann Gleanna Righe o'n Iubhar anuay eatorra agus Clannaibh Rudhraighe agus nir fhilleadar clanna Rudhraighe anun o sin a le—i.e., on the hither side of Gleann Righe, the boundary of Gleann Righe was formed from the Newry upwards between them (that is, the Clann-Colla), and the Clanna Rudhraighe, and the Clanna Rudhraighe never returned across it from that time to the present. On an old map of Ulster the river of Newry is called Owen Glanree fluvius." Dr. O'Donovan ("Book of Rights," p. 137) says: "It is remarked in the accounts of the battle of Achadh Leithdheirg, that they (the Oirghialla) never extended their kingdom beyond it (Gleann Righe), for that a definite boundary was formed on this side of Gleann Righe from Newry upwards. This boundary still remains in tolerable preservation, and is now known in Irish by the name of Gleann na muice duibhe—i.e., 'the valley of the black pig,' and the Danes Cast in English." Probably the valley of the Newry river was named Gleann Righe from the boundary, and not from the river, though Righe was the name of several rivers in Ireland. Perhaps also the word righe may be cognate with the Latin rectus, Greek orthos, with which may be compared modern Irish direach and German direkt, from Latin directus. The forearm is also named righ in Irish, righe being genitive case of righ, but the Irish nominative is often a borrowed genitive form. We have also another form of the word in the name Eisgir Riada, the name of a line of natural gravel pits from Dublin to Galway, which was the boundary of Leath Cuinn, or "Conn's half," from Leath Mogha, or "Mogh's half.' Conn and Mogh Nuadat, according to the bardic history, being kings respectively of North and South Ireland.

The term Danes' Cast applied to the boundary attributes its formation to the Danes, to whom were also attributed the Irish stone forts, raths, lisses, round towers, etc. In Munster the fox is believed by some old people to have been introduced into Ireland by the Danes, and I am acquainted with a certain family, the members of which are said to have tails, because they are supposed to have descended from the Danes.

The boundary is also named Gleann na muice duibhe, or "valley of the black pig or sow." In many parts of Ireland the people still relate marvellous tales of the black pig (2), and in the Cahirconlish district the old people say that the black pig came from Ulster. About four miles north of Lough Gur, in the county of Limerick, is a hill in the district of Ludden (Irish Lodan) on which is a stone circle surrounding a high pillar stone named Buachaill Breige, and from this stone to Lough Gur there is a row of stones. Only very few now are left, but the old people say there were very many of these stones, and that numbers were destroyed from time to time by seekers of gold supposed to be buried beneath the pillar stones. The old road running beside the row of stones is on a map of Down survey named Boherleagaun, and the row is called by the people at present the Liagane Line, and Gleann na muice duibhe. Mr. Hackett ("Trans. O.S. Soc.," vol. v., p. 166) says: "We may remember also that in the Imokilly legends it was from Bally-Finn he (Finn) first set out on his expedition against the boars of Imokilly, the time he slew the torc who flourished at Glenturkin, near which the grave is shown where Fionn buried the boar at Finure. It was after that he crossed Cork harbour and landed at Cuaneenrobert; he then sojourned at Rathfean, and thus far he had fought single-handed, but at Fahalay all his warriors joined him. There is a Glen-a-muck-dee (Gleann na muice duibhe) near Ringabella at Gurtagrenane." See also Joyce's Irish Names, vol. i., p. 173 (3). On a hill close to the south shore of Lough Gur is the site of a cromlech named Leabadh na muice, or "lair of the pig," which is described in Ordnance Letters, and is also mentioned in the "Dolmens of Ireland," by Mr. W. C. Borlase. A short distance south of the cromlech is a carn, and a little to the east a rath. Passing on from this to Knockaine is an ancient rampart of earth and stones which the people call the Black Ditch, and which also appears to have been the track of an ancient road. Lewis ("Topographical Dictionary of Ireland," vol. ii., p. 680) says: "A large double trench called by the Irish Rian-bo-Padruic, 'the trench of St. Patrick's cow,' commences to the east of Knockmeledown, and runs in nearly a direct line across the Blackwater, and through the deer-park of Lismore, towards Ardmore, being traceable for sixteen or eighteen miles; it corresponds exactly with that extraordinary work called the Danes' Cast, which runs through the counties of Armagh and Down. A second trench, which runs from Cappoquin through the plain along the sides of the mountains westward into the county of Cork, is called by the peasantry Clee-duff."

In his article on County of Kerry, Lewis says: "Clee Ruadh, or 'the Red Ditch,' is a singular line of defence, commencing at a place called Caher Carbery, near Kerry Head, and carried eastward to the Cashen river, beyond which it re-appears, and proceeding over Knockanure mountain, it enters Limerick county, where all traces of it are lost. It is conjectured to have been an ancient line of demarcation between the principalities of Thomond and Desmond." A portion of the Cladh Dubh, or "Black Ditch," south of Lough Gur, is named Cladh na leac, or "trench of the flagstones," there being three cromlechs and some pillar stones close to the track of the road or boundary. In "Mesca Ulad," p. 17, it is stated that when the Ultonians were encamped in Clin-Mail-mic-Ugaine, some distance to the south of Knockaine, in county of Limerick; that they raised stone columns to shelter their horses, "and that these echlasa of the horses of Ulad remain still from that time to this." No traces of the echlasa are now left, and it has occurred to me that the stone columns (colomna cloch) may have been pillar stones of the ancient lorg, or track, which passes southwards from Knockaine. Several ancient roads must have led to Knockaine, which in the prehistoric period was a most important settlement. In "Silve Gadelica," p. 576, we read: "Knockaines history tell to me—is there here one that remembers it?—best hill (a time there was) that stood on Ireland's wondrous land."

J. F. LYNCH.

Cahirconlish Rectory.

(1) Ptolemy (130 A.D.) names the Ulaid, Ouolounioi, which is the same word as Ulaid, said by O'Beirne Crowe to signify "graves," but the name Ulad is a personal one, and most likely is the same word which occurs in Uladislaus or Wladislaus, the name of sundry kings of Hungary and Bohemia. Ptolemy terms Emain Macha, the ancient royal city of the Ulaid Rigia, probably from Irish Righ, Latin rex., "a king." Cruachan, the royal city of Connaught, s named Rigia etera (the other Rigia) by Ptolemy.

(2) Compare Hibbert Lectures by Professor Rhys, p. 516:—

Hwch du gwta
Ar bob camfa,
Yn nydu a chardio
Bob nos G'langaea'

A cutty black sow
On every stile,
Spinning and carding
Each November-eve.

(3) Compare Dr. Joyce's variant of the legend of the black pig with the variant given by Mr. Hackett ("Trans. O.S. Soc.," vol. v., p. 165). See also the account given in Silva Gadelica, p. 138, of Lecht na muice.

CUPID DESIGNING.

From the Italian of Rossi.

I marked one day with vast surprise,
A little blooming love,
Who, with his bright, unbandaged eyes,
The painter's art would prove;
With cautious footstep I drew near,
To watch the busy creature;
And saw amazed thy form appear—
True to each absent feature;
For with his own unerring dart,
He drew thy image on my heart.

M. DE V.

A writer in "Nature" points out the advantage that would be gained by the use of magnetic iron ore as a material for concrete blocks. He points out that if magneticite is used instead of ordinary rock in the shape of fragments, and magnetic sand or ilmenite sand instead of common sea sand, concrete blocks can be obtained which have all the strength of the ordinary concrete blocks, and which weigh, when immersed in water, exactly twice as much as the ordinary blocks. Such an increase in weight makes the magnetic blocks far superior as regards resistance to the waves. Work constructed with magnetic blocks will stand when other work will be destroyed.

LITERARY NOTES.

The Rev. A. H. L. Benson, the Rectory, Castleconnell, Co. Limerick, whose fine poem, "Galway Bay," readers will remember in our first number, has carried off the first prize in the kingdom for a sonnet sequence (in the magazine, "Music and Poetry") entitled, "Birthday Wishes to a Young Organist."

✧ ✧ ✧

Rowland Hill was the most remarkable member of a very remarkable family of reformers, several of them having taken an active part in social and educational movements. Thomas Wright Hill, the father of Rowland, who claimed descent from Samuel Butler, of "Hudibras" fame, was a reformer in stenography. Rowland was a reformer in education before he became a postal reformer, and established a system at Hazelwood, Birmingham, which won the admiration of Jeremy Bentham, De Quincey, Grote, and influenced Dr. Arnold at Rugby. In later days Rosamond Davenport Hill, daughter of Matthew Davenport Hill, a criminal law reformer, has maintained the family traditions as a highly respected member of the London School Board.

✧ ✧ ✧

Sir Theodore Martin has been reading the autobiography, noticed by us the other day, of Miss Clara Morris, the American actress. He says in a letter that the book has quite fascinated him, and that as a piece of autobiography it will take rank with anything he knows. Sir Theodore continues:—

> There is the same genius in Clara Morris's writing as there obviously was in her acting. All she says about acting should be carefully conned wherever a true love of that now almost lost art exists. But everybody, whether they care about the stage, must be charmed by the story of the girl's noble struggles, by her high, frank, noble spirit, as well as by the power of her descriptions, both of scenes and characters.

✧ ✧ ✧

The autobiography of Sir Walter Besant contains a number of useful and interesting hints for literary aspirants. It appears from the book that Sir Walter did not become wholly dependent on literature for a living until he was fifty. The secretaryship of the Palestine Exploration Fund had been for nearly twenty years his stand-by, yielding him £300 a year. But long before he gave it up he was earning another £200 a year by writing, which he did not only in his out-of-office hours, but in the office itself when this was possible. He says —"I would urge upon everybody who proposes to make a bid for literary success to do so with some backing—a mastership in a school, a Civil Service clerkship, a post as secretary to some institution or society—anything, anything rather than dependence on the pen, and the pen alone."

✧ ✧ ✧

The prospectus of the Celtic-Cornish Society has just been issued. All Cornish people, people of Cornish blood, and Celts of other countries, are eligible for membership. The Society seeks:—

I. To preserve from damage and destruction and to study the stone circles, cromlechs, menhirs, hut-circles, beehive dwellings, camps, hill forts, castles, logan and crick stone, stones, crosses, oratories, holy wells, cemeteries, barrows, and inscribed stones.

II. To keep carefully every national custom, and above all the truly Cornish sports of Wrestling and Hurling, by presenting every year a belt to be contended for by Cornish wrestlers, and inscribed silver hurling balls for each parish in the Duchy that will ordain an annual Hurling Match on its Feast Day.

III. To revive the Cornish language as a spoken tongue by publishing a Grammar and Dictionary of the language, by printing all Cornish manuscripts not yet printed, by giving prizes for fresh compositions in Cornish, by paying a premium for teaching Cornish to schoolmasters able to satisfy the Council of their fitness, and also by reviving the ancient Cornish Miracle Plays, and re-establishing the Cornish Gorsedh of the bards at Boscawen-Un.

✧ ✧ ✧

"The Critic" of New York prints several lists of the books most in demand at the circulating libraries of America during the past month. Mr. Gilbert Parker's "The Right of Way" is the most popular novel. The librarian of the Public Library at Toronto has supplied the following list:—

Caroline, Queen Consort of George II. Wilkins.
The Birds of Siberia. Seebohm.
The Bi-literal Cypher of Sir Francis Bacon. Gallup.
The Life of Lord Russell of Killowen. O'Brien.
The Growth of the Empire. Jose.
Lady Sarah Lennox. Stavordale.
Confessions of a Caricaturist. Furniss.
Robespierre: A Study. Belloc.
Jane Austen: Her Homes and Her Friends. Hill.
Reminiscences of a Long Life. Killen.
The Velvet Glove. Merriman.
A Modern Antæus.

✧ ✧ ✧

A writer in the "Author" has been discussing the difficult question of copyright in the titles of books and of the value of titles themselves. As regards copyright in titles, the general legal view appears to be that such a thing does not exist, so that the whole matter really resolves itself into a question of good taste on the part of the author. The question of titles as an indication of the contents of a book is almost equally difficult. The "Author's" contributor says:—"Titles are sometimes hopelessly deceptive," and proceeds to tell a story of the head of a "scholastic establishment," who imagined "Cometh up as a Flower" to be a work on botany. For such literal-mindedness as this (remarks the "Academy") we fear there is no hope, but there is something in the contention that the title of a novel should suggest its general bearing. The difficulties, however, are obvious, and certainly many of the best novels tell nothing on their covers. A novelist of our acquaintance, whom we congratulated the other day on his decorative and distinctive, if rather precious, titles, surprised us by saying that all his titles had been suggested by his sisters, and his cousins, and his aunts. After all, the best title in the world cannot do much; even "Vanity Fair" might easily suggest different ideas to people who had not read the book.

✧ ✧ ✧

While climbing the literary ladder this is how Sir Walter Besant lived:—

> I was unmarried. I lived in chambers, and still keep my secretaryship. It is really astonishing how well one can live as a bachelor on quite a small income. My rent was £40 a year; my laundress, washing, coals, lights, and breakfast cost me about £70 a year. My dinners—it is a great mistake not to feed well—cost me about thirty shillings a week. Altogether I could live very well indeed on about £250 a year. Practically I spent more, because I travelled whenever I could get away, and bought books, and was fond of good claret. The great thing in literary work is always the same—to be independent: not to worry about money, and not to be compelled to do pot-boiling. I could afford to be anxious about the work and not to be anxious at all about money.

These statements are interesting, but we fear they bear a very superior relation to what is possible to the average young literary struggle-for-lifer of the day. On the other hand, the following tabular statement of how Sir Walter Besant reached that plateau which, when it is won, offers the level highway of success, has a wider application. "I would beg the candidate for literature," he says, "consider how it was done":—

1. I was not dependent on literature—I could spend time on my work.
2. I began by producing a book on the subject on which I desired to be a specialist. The work had a "succes d'estime," and in a sense made my literary fortune.
3. This book opened the doors for me of magazines and reviews.
4. The knowledge of French matters also opened the door of the daily press to me.
5. I followed up the line by a second book on the same subject. The press were again, on the whole, very civil.

✧ ✧ ✧

"A writer or compiler of a dictionary" is the uncoloured definition which Mr. Henry Bradley gives to the word Lexicographer in the new part of the Oxford English Dictionary. And he quotes, doubtless with feeling, Dr. Johnson's inside definition: "A harmless drudge, that busies himself in tracing the original, and detailing the significance of words." Indeed, one might easily suppose that Mr. Bradley had imported into his quotations some of these emotions which the Doctor expressed in the definition itself. Macaulay's dictum, for example: "The best lexicographer may well be content if his productions are received by the world with cool esteem." He refers, too, to a passage in which Byron expressly rules out the lexicographer as a useful purveyor of new words:—

> No slight applause will candid pens afford
> To him who furnishes a wanting word.
> Then fear not, if 'tis needful to produce
> Some term unknown, or obsolete in use,
> (As Pitt has furnish'd us a word or two
> Which lexicographers declined to do).

To the best couplet Byron adds the note: "Mr. Pitt was liberal in his additions to our Parliamentary tongue; as may be seen in many publications, particularly the 'Edinburgh Review.'"

✧ ✧ ✧

One of the chief features of the sale of the Hibbert Library at Sotheby's was the record price of a set of the first editions of Defoe's "Robinson Crusoe," "Farther Adventures," and "Serious Reflections," 1719-20, all fine copies, bound uniformly in sprinkled calf extra. The set, which is said to have cost the late owner thirteen guineas, was knocked down to Mr. Quaritch at £205. Remarkable prices were also paid for first editions of Keats, which in no case had the advantage of being in the original boards. The principal lots included the following:—

Thos. Gay, Poems, 1775, Horace Walpole's copy, with very profuse and valuable notes in his hand, and with a number of prints, etc., added	£197	0
Ditto. Odes, 1757, first edition, wanting the half title, bound up with other tracts, and with numerous interesting notes by Horace Walpole	60	0
John Keats, Poems, 1817, fine copy	79	0
Ditto, Lamia, Isabella, etc., 1820	55	0
Ditto, Endymion, 1818	28	0
Phineas Fletcher, The Locusts, 1627, first edition	69	0
Ditto, The Purple Island, 1633	20	0
Ben Jonson, Workes, 1616, first folio edition. This copy belonged to Charles II., bearing his motto and signature on p. 677	61	0
R. Holinshed, Chronicles, 1577	60	0
C. M. Westmacott, The English Spy, 1825, with twenty-seven fine coloured plates by R. Cruikshank	51	0
J. de la Fontaine, Contes et Nouvelles, 1762	49	0
Ditto, Fables Choisies, 1765-75	40	0
Fenelon, Aventures de Telemaque, 1785, Didot's finely printed edition	40	0
T. D'Urfey, Songs Compleat, 1719-1720	49	10

SCIENTIFIC TOPICS.

An electric automobile mail delivery was recently inaugurated in Minneapolis, and is said to have proved itself in every way efficient.

✧ ✧ ✧

A charter has been given to Boston capitalists to build an electric line from Toronto to Cornwall, a line from Brockville through Smith Falls to Ottawa, in all about 350 miles. The fund for this purpose will be £1,600,000, and the work will be pushed to an early completion.

✧ ✧ ✧

The darkness that has pervaded the Pyramids for thousands of years is now to be dispelled by the electric light. Maspero, the director of the society entrusted with the preservation of Egyptian antiquities, has begun work on the historic temple of Karnak at Thebes. So successful has the result been that the inner passages and catacombs of the great Pyramids are now to be lighted.

✧ ✧ ✧

The United States Navy Department has placed with the Allgemeine Elektricitaets Gesellschaft an order for a complete outfit of Slaby-Arco wireless telegraphy instruments. Secretary Long has decided to test the various systems of wireless telegraphy which are now in use in this country and abroad in order to obtain accurate data of their comparative efficiency.

✧ ✧ ✧

The Imperial Health Department of Germany, which numbers among its counsellors some of the most distinguished scientists, has lately considered the posibility of exterminating rats throughout the empire. It is the object of the health department to mitigate the danger from the spread of contagious diseases. Dr. Robert Koch, the eminent bacteriologist, has been commissioned to devise a plan of getting rid of the rat pest in the east port-towns.

✧ ✧ ✧

A company is being formed in St. Louis for the manufacture of the power plough designed by Richard J. Gatling, the designer of the famous rapid-fire gun bearing that name. This machine is said to do the work of from thirty to forty men, using from sixty to eighty horses, and the cost per day for fuel is said to be six dollars when using oil, wood or coal and two dollars per day when using gasoline. A wheat drill may be attached to the machine, and the grain sown as the disks turn up the earth. The first public appearance of the Gatling plough will be at the St. Louis Exposition.

✧ ✧ ✧

The ninety-fourth anniversary of the first successful burning of anthracite coal in a grate was celebrated at the old Fell Hotel in Wilkesbarre, Pennsylvania, where that interesting event took place. The old fireplace and grate are still preserved, and the room in which they are located was gaily decorated in honour of the event. A banquet was served, and among the speakers was H. P. Fell, a descendant of Jesse Fell, the old proprietor of the house. The first steps were taken toward the celebration of the centennial anniversary of the discovery six years hence, and it will in all probability be an affair of national and State importance.

✧ ✧ ✧

An explosion took place in the nitro-glycerine house of the Cerberite Manufacturing Works at Ardwick, Maryland, on the morning of February 5th, and although the concussion was terrific, a large quantity of the cerberite, which was stored in another house only a short distance away, was not affected, thus giving a practical demonstration of the remarkable quality of the explosive, which, it is said, requires the combined action of flame, heat and concussion to detonate. In practice, a percussion cap is used to explode it. Cerbite is the discovery of Count Sergy de Smolianoff, a Russian chemist, who died about a year ago in Washington.

✧ ✧ ✧

The first practical trial of a new system of the single-rail railroad is to be made at the Crystal Palace, London. The line, which is to be one and a half miles in length, will be worked by electricity. One terminus will be alongside the low-level station of the London and Brighton and South Coast Railway. Thence it will run up the hill to the Palace Buildings and around the lakes in the grounds. The difference between this system and the prevalent type of mono-rail is that the line is on the ground, and large wheels projecting from the middle of the carriage run on it, while on each side of the carriage there are safety rollers upon guide rails. In the mono-rail the line is elevated, with the carriages overhanging on each side, thus placing the centre of gravity below the rail. The experimental railroad will cost £14,000, and the line will be in working order by July.

✧ ✧ ✧

English and American capitalists are to build a railroad which is to run from Eureka, Humboldt County, Cal., to Weiser, Mont., to connect with the Northern Pacific. Eureka is a town of 10,000 in a country without a railroad. The proposed line will open this part of California, traverse the redwood country, and the south-east corner of Oregon, cross the Idaho, and finally merge into the Northern Pacific. The road, it is claimed, will open up a territory containing about 250,000 population at present, and capable of supporting a million, but now without proper traffic facilities.

✧ ✧ ✧

An instrument for indicating and recording the approach of thunder storms is in use at St. Ignatius' College, Cleveland, Ohio. The apparatus comprises a relay, a sounder, a coherer, two condensers, a choking coil, two batteries of two and four dry cells, a clock with recording cylinder, and a copper collector fixed to the tower roof. The action of the storms upon the recorder is as follows: If, at some distance from the receiving station, there is a violent discharge of electricity within a cloud, the electrical oscillations it occasions will impinge upon the collector on the roof and close the coherer circuit. The waves, however, pass the coherer without obstruction, thereby building bridges for the battery current in this circuit. The relay in the coherer circuit is energised, and closes the recorder circuit in the usual manner.

✧ ✧ ✧

In an article printed in the "Physikalische Zeitschrift" K. R. Koch states that he has found that lightning conductors, the connections of which have become imperfect through rusting, nevertheless act in an efficient manner during a thunderstorm. In his opinion this phenomenon is due to the oscillating character of a lightning discharge. Electromagnetic waves have been produced, which act upon the imperfect connections as upon a coherer, restoring the conductivity for a period more or less long. Hitherto lightning has been considered a continual discharge, which often becomes apparently oscillatory by quick repetition. In order to prove this theory experimentally Koch employed a rapidly revolving camera. Unfortunately he has not been able to furnish as complete a proof of his theory as might be desired, for the flashes photographed were all too distinct.

✧ ✧ ✧

Some twenty years ago a German engineer who was surveying for a railway in Asia Minor heard that a large marble statue had come to light in what is known now as the town of Bergama. He soon became convinced that owing to the largeness of the remains it formed a part of the representation of the battle of the gods which took place on the heights of Pergamon. Further investigations proved this to be the case, and Herr Humann conducted the explorations between 1878 and 1886 upon the spot where he made his first find, the Prussian Government providing the means. Much of the magnificent temple and altar which were erected on the Pergamon height between the years 197 and 159 B.C. had disappeared under the combined influences of the weather and vandals. Some larger portions and small fragments were conveyed to Berlin, and now a special museum has been opened for the reception of these magnificent specimens of Hellenic art. The building in shape and size resembles the original altar with its frieze. The gigantic figures have been set up in their former order, and every possible fragment has been utilised.

✧ ✧ ✧

American bankers learned a long time ago that saving deposits were to be had for the seeking, and several methods of seeking them, particularly by distributing small boxes which can only be opened at the banking office, have been used successfully. French bankers have just taken several strides in advance by introducing the automatic savings bank, which tours the country districts at stated intervals and gathers in the savings of the thrifty peasants. An electric motor car has been built for the purpose. It provides seats for a cashier and two clerks, arranged about a revolving table. There are shelves on the walls for the bank books, and a strong box is built into the body of the car. The officials are from the Mezieres Treasury Administration, and the cashier has power to receive deposits of any amount. As there is no desire on the part of the authorities to facilitate the withdrawal of funds, the peasant is forced to come to the central bank when he needs money. The automobile bank began its rounds some time ago, and has met with a most favourable reception.

✧ ✧ ✧

In a recent issue of the "Tramway and Railway World," Mr. Magrini Effren, of Turin, shows how rapid and extensive has been the development of electrical traction in Italy. The first electric tramway put down in Italy dates back to 1890. The line runs from Florence to Fiesole. Genoa and Milan followed in 1893. Two years later the Eternal City itself saw the advent of the electric tramway. Turin, Naples, and Leghorn, and other cities are now included in the list. Water power instead of steam is used at the generating stations, in many cases. While the railways, as a rule, have adopted a conductor rail, the use of overhead wires for the tramways is quite general. The latest development is the Lecco and Sondrio Railway, about which so much was heard at the recent arbitration proceedings regarding the system of electric traction for the Metropolitan and District Railways of London.

✧ ✧ ✧

A New Haven photographer, A. Hyatt Verrill, a son of Professor E. Verrill, of Yale University, announces further discoveries in his experiments with colour photography. Verrill says he has found it possible to produce "aurotypes" and "argentypes" simply by depositing gold and silver in metallic form on glass, wood, metals, and even on paper. The pictures thus made are claimed to be absolutely permanent. It is to be understood that there has hitherto been no real photograph in colours taken from nature. The three-colour process is simply an approximation, and in all methods there has been the necessity at some stage of the work of matching colours for the dyeing of the films. Of course, Uppmann's mercury process was an exception in a way, but it never produced photographs direct from Nature with all the tints in their exact values. Mr. Verrill shows a Bermuda landscape in which the beautiful tints of the water and sky are brought out, as well as the soft creamy colour of the houses and the neutral grey of the rocks. The most delicate shades of green, blue, pink, purple, orange, and yellow are reproduced direct from Nature for the first time in an "autochromatic" manner with surprising softness and accuracy.

GLIMPSES OF THE PAST.

From the Dublin Newspapers of 1793.

DUBLIN.

JUNE 28.—Thursday, at the Commission of Oyer and Terminer, and a general jail delivery of the county of the city of Dublin, held at the Court of the King's Bench, before the Hon. Baron Power, Patrick Magrath was indicted for feloniously, scandalously, and maliciously, and contrary to his Majesty's peace, his crown, and dignity, uttering a curse against his present Majesty and the Royal Family, and other felonious expressions, in the hearing of several persons, at a house in Copper alley, on the 11th day of March last.

The principal evidence on behalf of the prosecution was one Taylor, a pensioner, belonging to the Royal Hospital, who proved that the traverser had made use of the imprecation and expressions charged in the indictment and had abused himself as an old fogy; whereupon he went from the house secretly (it being a late hour, and fearing for his personal safety) and brought a guard from the police-house, to whom he gave the prisoner in charge.

It appeared that the parties, together with several others, had assembled at a room where was a wake of a person deceased; that the prisoner and another raised a row in the company, being inebriated: that whiskey was introduced, of which all the company partook, and in the interim some altercation having arisen between the traverser and Taylor, the former made use of the above and other ridiculous expressions, as that the King was a shoe-boy, and that he, the traverser, could not buy a naggin of whiskey, but the King had a penny out of it, etc.

The evidence being closed, the judge gave a strict charge to the jury: he observed that the facts stated in the indictment had been clearly proved; and that his being drunk was rather an aggravation than exculpation of the crime. It appearing to the jury that the man must have been in a state of insanity, they brought in their verdict—Guilty of uttering the words, but not out of malice. The judge desired them to reconsider their verdict, but having delivered the same a second time, he declared he never before received such a verdict, and ordered the Clerk of the Crown to furnish him with their names, and that the prisoner should be remanded to prison till he consulted the twelve judges on the propriety of the verdict.

JULY 2.—This day being quarter-day of the Corporation of cutlers, painters, stainers, and stationers, or Guild of St. Luke, the following gentlemen of the Roman Catholic persuasion were unanimously admitted to the freedom of the said Corporation, in pursuance of the Act of the present Session—viz:—

Thomas M'Donnell, stationer.
Richard Cross, ditto.
Patrick Wogan, ditto.
Patrick Byrne, ditto.
Hugh Fitzpatrick, ditto.
Peter Hoey, ditto.
Luke Dempsey, painter.
John O'Neille, ditto.
Thomas Smyth, ditto.

Yesterday were executed in front of the new jail in Green street, Laurence and Patrick Penrose (brothers), John Delany, and Edward Boyce. The first three for the murder of Counsellor O'Grady, and the latter for firing a loaded pistol at a policeman, with intent to kill him.

They were executed two at a time: Delany and Boyce were thrown off first, about one o'clock; and, after hanging better than half an hour, were cut down, when the Penroses immediately followed.

They all acknowledged the justice of their sentence. Boyce and Delany behaved in a hardened manner, and did not seem to have a terror of death upon them. The Penroses, before they were turned off, took an affecting leave of each other, and behaved with a propriety suitable to their unfortunate situation.

The three for the murder of Counsellor O'Grady, denied each having perpetrated the act, but confessed being present at the time that gentleman was shot. The bodies of the four were sent to Surgeon's Hall for dissection, according to the statute.

Wednesday last the remains of the Right Hon. the Earl of Moira were deposited in the family vault at Moira, in the county of Down. The great concourse of people who attended on this melancholy occasion proved how universally his lordship was esteemed in the country, at the same time it manifested the just sense they entertained of the many virtues which adorned both his public and private character.

The signs of sorrow shown by his lordship's numerous tenantry were a sufficient testimony that he was not only respected as their landlord, but beloved as their friend. Of all who followed his remains to the grave, none seemed insensible of that stroke of death which had deprived the country of an honest man, society of its brightest ornament, and the poor of one of their best friends.

The funeral service was performed by the Rev. Mr. Ford, vicar of Ballynahinch, and one of his lordship's domestic chaplains. The pall was borne by six of the principal gentlemen of the county, and the chief mourner was the Right Hon. the Earl of Granard.

Yesterday Messrs. Butler and Bond were removed from Newgate to the Exchequer-chamber, by virtue of an Habeas Corpus. The Chief Baron having heard Counsellors Emmet and Shearer, on behalf of the prisoners, observed that the House of Lords was now sitting, and that, if error was a plea, it ought to be submitted to their lordships. He remanded the gentlemen to prison.

Tuesday last, at the Commission of Oyer and Terminer, James Sewell, proprietor of a publichouse in Barack street, was arraigned and tried on an indictment for an assault and illegal imprisonment of Robert Stephen Williamson, Esq., of the Post Office, on the 9th of June last.

It appeared that the prosecutor, who had spent the day in the country, was returning to town through Barrack street, between nine and ten o'clock of the evening of the said day, and hearing a fiddle playing in the house of Sewell, he stopped, and was invited in by Sewell and a Sergeant Kelly, and having gone in accordingly, Kelly threw a shilling towards Mr. Williamson's boot, which he took up and threw back again to Kelly.

Upon this Kelly and Sewell told him he was the King's man, and that the shilling was to drink his Majesty's health. Mr. Williamson then remonstrated with them, and informed them that he was not of that class of persons who commonly enlist as soldiers, holding an employment in the Post Office. But, notwithstanding, they detained him close prisoner all that night and the next day, and between three and four in the afternoon brought him in a coach down to Rogerson's quay, and sent him on board the Mary sloop, a tender lying in this harbour, where, after receiving gross abuse from the parties, he was detained until the following day, when, getting an opportunity of sending a message to the Post Office, he was liberated by the Lord Mayor and one of the Sheriffs.

Sewell was found guilty; and Kelly, not appearing until the trial was over, was ordered to Newgate, to abide his trial at the next Commission.

JULY 12.—Yesterday the business of the Commission was concluded by Baron Power, when the following convicts received sentence:—

Patrick Hayden, a letter-carrier belonging to the Post Office, for stealing and embezzling from a letter committed to his charge, nine bank post-bills, value £30—to be hanged on Saturday, the 20th inst.

Joseph Murphy, a boy of sixteen, for a highway robbery at Blackpitts—to be hanged on Saturday, the 24th of August; but recommended by the jury, and promised to be represented by the judge, on account of his youth.

Michael Connolly, for a highway robbery, in company with six others (four of whom were hanged last week—three for the murder of Mr. O'Grady), on Sir James Sinclair Erskine and his retinue in February last—to be executed on Saturday, the 20th inst.

And James Cregan, a hackney coachman, for aiding and abetting in the said robbery, by driving his coach, with his accomplices, to the place, being present during the robbery, and driving back to town his accomplices with their booty—to be hanged the same day.

Michael Dunn, for various felonies—to be transported for life.

Margaret Colligan, for receiving goods knowing them to be stolen—to be transported for seven years.

Hugh Matthews, for felony—to be transported for seven years.

Michael Reilley, of Milltown, for stealing from Edward Keogh two notes, value twenty guineas—to be transported for seven years.

Patrick M'Innerny, for felony—to be transported for seven years.

Samuel Busby, for assault, false imprisonment, and cruelty to his children, to be imprisoned for six months, and fined three hundred pounds.

And Judith Busby, his wife and accomplice in the said crime, to be imprisoned two years.

At the commencements held on Tuesday last, in our University, by the Right Hon. Lord Fitzgibbon, Lord High Chancellor of Ireland, and Vice-Chancellor of the University, the undernamed gentlemen were admitted to the following degrees:—

DOCTORS OF LAW.

Right Hon. Arthur Wolfe, his Majesty's Attorney-General (honorary), and
William Smith.

DOCTORS OF PHYSIC.

Whitley Stokes,
Edmond Cullen,
Robert Percival,
Stephen Dickson,
John Edward Boyton, and
James Cleghorn.

BACHELORS OF LAWS.

William Smith,
James Lyne,
Richard Dobbs, and
Christopher Edmond Allen.

BACHELORS OF PHYSIC.

Whitley Stokes,
Edmond Cullen,
Robert Percival,
Stephen Dickson, and
James O'Beirne.

MASTERS OF ARTS.

Honourable Edward Taylor,
Peter Alley,
Henry Maturine,
John Dobbs,
Thomas Prior,
Peter Roberts,
Gustavus Wybrants, and
James Ryan.

And thirty-two young gentlemen, among whom were sixteen fellow-commoners, were admitted to the degree of Bachelor of Arts.

(To be Continued.)

THE TOWN OF BALLINA.

FROM A PICTURE OF SEVENTY YEARS AGO.

(From Lewis's "Topographical Dictionary of Ireland, 1837.)

Ballina, a sea-port, market, and post-town, in the parish of Kilmoremoy, barony of Tyrawley, county of Mayo, and province of Connaught, 17¼ (N. N. E.) from Castlebar, and 125 miles (W. N. W.) from Dublin; containing 5,510 inhabitants. This town, originally called "Belleek," or the "Ford of the Flags," owes its origin to O'Hara, Lord Tyrawley, who built the first street, of which some houses are still remaining; and is indebted for the commencement of its commercial importance to the establishment of a cotton factory here, in 1729, by that nobleman, who also obtained for the inhabitants the privilege of a weekly market and a fair. During the disturbances of 1798 the town was attacked by the French under Gen. Humbert, who, having landed on the 22nd of August in Kilcummin bay, and made themselves masters of that town, sent forward on the day following a detachment to assault this place, which on its approach to the town, affecting to retreat from a reconnoitring party that had been sent out by the garrison, led it into an ambuscade, where the Rev. G. Fortescue, nephew of Lord Clermont and rector of the parish, who had volunteered his services, was shot by a party of the French that had concealed themselves under a bridge. On the day following, the main body of Gen. Humbert's forces advanced to the town, of which they took possession on the evening of the 24th, when the garrison, under Col. Sir T. Chapman and Major Kerr of the Carbineers, retreated to Foxford, a village about eight miles distant.

The town is beautifully situated on the river Moy, by which it is separated from the county of Sligo, and on the mail coach road from Sligo to Castlebar; it consists of several streets, and contains about 1,200 houses, most of which are regular and well built. The river Moy, over which are two stone bridges, is navigable from the sea, about six miles distant, for vessels not drawing more than 11 feet of water, to within a mile and a half of the town. A ship canal was formerly commenced by Government, under the superintendence of Mr. Nimmo, for bringing vessels up to the town, instead of landing their cargoes at the present quay; but after £1,000 had

been expended, the works were discontinued, and have been since falling into decay. A communication by canal to Lough Conn, and thence to Galway, has been projected by Mr. Bald, the county surveyor, which would open an abundant source of industry and wealth to the inhabitants of these mountain districts, at present inaccessible from want of roads, and greatly increase the commercial interests of the town. The environs are pleasingly diversified.

A very extensive tobacco and snuff manufactory was established in 1801, by Mr. Malley, who first persevered in opening the navigation of the river Moy, and thus gave a powerful impulse to the commercial prosperity of the town: the manufacture continued to flourish, and in 1809 the duties paid to Government amounted to £8,000. In 1834, Mr. J. Brennan, a merchant from Belfast, introduced the provision trade, which was previously unknown in this neighbourhood, and erected spacious premises adjoining the river, and commodious stores 350 feet long and 140 feet wide, with complete apparatus adapted to a peculiar method of curing. The weaving of linen is carried on to a small extent by weavers who work in their own houses. On the eastern bank of the river are the remains of an abbey, founded by St. Olcan or Bolcan, a disciple of St. Patrick; they have a large, ancient doorway of beautiful design.

THE SONGLESS SINGER.

North of the moon he slept one night
  Between the flow of the sea and the ebb;
Where the wild things born of the dark and the light
  Threw round him their subtle and spectral web.
And they sang him tunes of no man known,
  A secret rythm, a joyous sigh,
And he heard the wind from nowhere blown
  Out of a vast and empty sky.

North of the moon he slept till morn,
  And shapes forbidden about him came,
The days that are dead, and the days unborn,
  And faces fashioned out of the flame,
The gleam of crowns of uncrowned kings,
  The grace of the hidden sacrifice,
While softly the sweep of foam-white wings
  With the greater grail sailed twice and thrice.

North of the moon he trod the hills,
  The fair blue hills topped close on heaven.
He saw the tints that the sunbeam spills
  Beyond the edge of the sacred seven.
The towers of the Parsifal he saw,
  And heard their airy trumpets' breath,
And he felt song's mighty pulses draw,
  And he learned what love is, and what death.

North of the moon he sleeps no more—
  Dark in eclipse till his soul shall hear
The mystical measures falling o'er
  That borderland of a smile and a tear.
And the runes he read, and the dreams full sweet,
  He tells to none, since he lost the way
That he wandering seeks with weary feet
  North of the moon till break of day.

The report of the workings of the German canals states that there are 8,650 miles of inland waterways open to traffic. In 1900 nearly seven million tons of goods were conveyed to Berlin by the canals, and eight and a half million tons to Ruhrort. The Elbe has been made navigable for 550 miles. The canal between the Elbe and the Trave has been completed at a cost of five million dollars.

ISAAC BARRE.

THE CAREER OF AN ADVENTUROUS TRINITY COLLEGE MAN.

BY EBLANA.

This remarkable man was the son of Peter Barre, a French refugee, and was born in Dublin in the year 1726.

He entered Trinity College as a pensioner on the 19th November, 1740, became a scholar in 1744, and in the following year took his degree.

About this period he displayed a great taste for theatricals, and acted plays so well that Garrick urged him to go on the stage, offering him a salary of £1,000 a year.

But as he was intended for the law, he pursued his studies to that end.

However, he himself preferred a military life, and soon afterwards entered the army. He was gazetted an ensign in 1746, and joined his regiment in Flanders, served in Scotland and Gibraltar till 1755, when he set out for America.

With Richard Montgomery he took part in the attack upon Louisburg, and next he applied for a place in Wolfe's regiment when it was about to march against Rochfort in 1757. In this campaign he attracted the attention of his superior officers, his services introducing him to his commanding officer, and even to Lord Shelbourne.

In the intervals of duty he prosecuted his studies, and was connected with General Wolfe both as an officer and a penman; and on the attack upon Quebec became his adjutant-general.

During this battle, which took place on the 6th September, 1759, and in which the fort was defended by the French under Montcalm, Wolfe died on the field of victory, and Barre received a ball in the head.

In West's celebrated picture representing Wolfe's death on Abraham's heights, Barre is conspicuous among the officers surrounding the fallen general.

Having served for fourteen years, Barre deemed himself justified in applying to Pitt for promotion.

This was on the 28th of April, 1760, but his request was refused on the ground that senior officers would thus be injured.

However, he was advanced by Lord Amherst, and it was that carried the news of the capture of Montreal to England.

On his arrival in that country he became intimate with Lord Fitzmaurice, who, on succeeding his father, Lord Shelbourne, in 1761, and vacating the family borough of Chipping Wycombe, nominated Barre to the seat as a supporter of the Liberal party.

It was at this time that the Spanish difficulty was being debated, war being feared. Five days after his election Barre attacked Pitt in a fierce philippic, and the effect of his speech was heightened by his black, massive, and swarthy appearance and figure and military set, as well as by the bullet that had lodged loosely in his cheek, and given a savage glare to his eye. But, despite these drawbacks, Walpole declares that his diction, though bold and unsparing, was yet classical and eloquent.

Pitt called him to order, and Fox interfered; still Barre went on, and when he had finished Pitt made no reply, but turning to Beckford, asked fairly loud: "How far the scalping Indians cast their tomahawks?"

Pitt himself, however, had been a master of invective, and now he had found his match.

Charles Townshend being afterwards asked when the House would rise, said:

"I do not know; but when it does the roads will be as dangerous as if the army were disbanded."

Barre having observed that he would not answer for his head, but would for his heart, George Selwyn replied:

"Yes, if he could not, the former would not have been broken long ago."

Soon afterwards, seeing another member give Barre a biscuit, Townshend said:

"Oh, you should feed him with raw flesh!"

The Rev. Philip Francis also attacked him.

It was not till ten years later, as we shall see, that the secret of these amenities was revealed.

Early in 1763, Isaac Barre was created, under Lord Bates' Administration, Adjutant-General and Governor of Stirling, at a salary of £4,000 per annum. He did not, however, retain this position long, owing to his opposition to George III.; and in the following September, the Grenville Ministry coming into power, he was dismissed from his lucrative post and from the army as well.

In 1764, however, he and Pitt were reconciled, their attachment lasting during the latter's life.

On the 12th of April, 1764, the election of the East India Directors took place. In this contest the Duke of Devonshire put forward Lord Clive, while the opposition candidate was Sullivan, the nominee of Lord Shelbourne. The latter, however, was defeated.

Had Sullivan succeeded, Barre would have been Governor to Bengal. As it was, this post devolved upon Lord Clive.

When the question of the taxation of America arose, Barre strenuously opposed it, he and Lord Shelbourne refusing to join the Rockingham Ministry.

In January, 1768, the British Parliament was opened by the King, and despite the remonstrances of Benjamin Franklin, it was determined to pass the Stamp Act through the House. But, as Bancroft says, George Grenville being afraid to meet Parliament on the naked proposal of the expediency of taxing America, he, with consummate art, resolved to place it "upon the most general and acknowledged grounds of Whig policy." Consequently the American question was presented as one of "obedience to the laws, and respect for the legislative authority of the kingdom," and further, that "temper and firmness, which would best conciliate due submission and reverence," was announced, and it was resolved to act smoothly, but "to establish as undoubted the authority of the British legislature in all cases whatsoever."

In the debates, to, on the forces to be kept up in the army and navy, Charles Townshend said:

"The colonies are not to be emancipated."

In vain did Franklin, Ingersoll, Jackson, and Garth, as agents for Pennsylvania, Connecticut, and South Carolina, remonstrate with the Minister on behalf of America, and against taxation by Parliament, or propose that if they were to be taxed, they should be invited to tax themselves, pleading the usual method of the King's requisition through the Secretary of State.

In this debate Isaac Barre was signally presented. He admitted, however, the power of Parliament to tax America, but derided the idea of virtual representation. Putting his hand to his breast, he cried in impassioned tones:

"Who of you, reasoning upon this subject, feels warmly from his heart, who of you feels for Americans as you should for yourselves or

as you would for the people of your own native country?" and taunting the House with its ignorance of the affairs of America, charged "those who should hold up their hands for the Bill as acting very much in the dark", adding, "but perhaps as well in the dark as anyway."

This charge of ignorance brought to his feet Charles Townshend, whose special charge American affairs had been. He suppopted the Stamp Act, insisting that the colonies had borne but a small proportion of the expenses of the last war, and had yet obtained by it immense advantages at a vast expense to the mother-country, adding:

"And now, will these American children, planted by our care, nourished by our indulgence to a degree of strength and opulence, and protected by our arms, grudge to contribute their mite to relieve us from the heavy burden under which we lie?"

When Townshend sat down, having delivered what he deemed his unanswerable argument, he immediately became aware that he had aroused the sleeping lion, as, with the rest of the House, he saw Barre rise, his eyes aflame, his arms outstretched, as he replied in the following ringing and stinging impromptu:

"They planted by your care! No; your oppression planted them in America. They fled from your tyranny to a then uncultivated, inhospitable country; where they exposed themselves to almost all the hardships to which human nature is liable; and, among others, to the cruelties of a savage foe, the most subtle, and, I will take upon me to say, the most formidable of any people upon the face of God's earth; and yet actuated by principles of true British liberty, they met all hardships with pleasure compared with those they suffered in their own country, from the hands of those who should have been their friends.

"They nourished by your indulgence! They grew by your neglect of them. As soon as you began to care about them, that care was exercised in sending persons to rule them in one department and another, who were, perhaps, the deputies of deputies to some members of this House, sent to spy out their liberties, to misrepresent their actions, and to prey upon them; men whose behaviour on many occasions has caused the blood of those Sons of Liberty to recoil within them; men promoted to the highest seats of justice, some who, to my knowledge, were glad, by going to a foreign country, to escape being brought to the bar of a court of justice in their own.

"They protected by your arms! They have nobly taken up arms in your defence, have exerted a valour amidst their constant and laborious industry for the defence of a country whose frontier was drenched in blood, while its interior parts yielded all its little savings to your emolument. And believe me—remember I this day told you so—the same spirit of freedom which actuated that people at first will accompany them still. But prudence forbids me to explain myself further. God knows I do not at this time speak from motives of party heat; what I deliver are the genuine sentiments of my heart. However superior to me in general knowledge and experience the respectable body of this House may be, yet I claim to know more of America than most of you, having seen and been conversant in that country. The people, I believe, are as truly loyal as any subjects the King has; but a people jealous of their liberties, and who will vindicate them if ever they should be violated. But the subject is too delicate. I will say no more."

This speech was acknowledged to be a heavy blow to Charles Townshend. After a debate of seven hours the motion was adjourned, but eventually passed by 245 to 49.

Ingersoll, one of the American delegates, who was present in the House, made a report of Barre's speech, which reached New England three months later, and which became household words throughout that State, and by midsummer it was translated into French and distributed in Canada.

It is said in reference to this speech and others of a like character, that the terrors of Barre's invective almost paralysed Charles Townshend, and dismayed Wedderburn.

As an opposition orator he was unrivalled, though in defence he was not so happy. And none took a more prominent place than he in opposition to Lord North's Ministry.

In "MacMillan's Magazine," 1876, quoted by Alfred Webb, is:

"The pre-eminence of Barre as a speaker was due principally to his extraordinary power of invective; but it would be a great injustice to suppose that there was nothing but invective in his speeches. On the contrary, some of them abound with wise maxims and good, sound common sense. He was generally on what we would call the constitutional side, and as the great constitutional questions of that day have all been settled in his favour, it is naturally difficult for us to help being struck by his arguments. But Barre does not deserve our unqualified approbation. He was essentially a party man. He spoke for his party and he voted with his party. Walpole called him a bravo, and nothing can so well illustrate the dependence of his position than the fact that, clever and eloquent as he was, the first trace we find of his making an original motion was in 1778, seventeen years after he entered Parliament. . . Barre found himself fighting the battles of the people, and his eloquence was of a sort peculiarly adapted to such warfare."

In Pitt's Administration he was restored to his rank in the army, and was appointed Vice-Treasurer of Ireland, as well as a Privy Councillor, holding that office until the break-up of the Ministry in 1768.

In that year Shelbourne and Barre were again in Opposition. The latter took an active part in Wilke's trials, and attacked the Government in his usual fierce and merciless manner, and quite aware of his power of inspiring fear.

The supposed secret of his attack upon Pitt ten years previously, came out during the discussion on Wilkes and Oliver in 1771, in this way:

Charles Fox, in an intemperate speech, moved to examine Alderman Oliver the next day, whom, he should consider, he said, in a public light as an assassin of the constitution. To this Colonel Barre replied that it became no man to call another an assassin who assassinated that person behind his back. Fox, in the same violent manner, replied:

"When I was a boy at school, I remembered nothing so well as the clamour against Barre for assassinating Mr. Pitt behind his back." To which Barre returned this thundering sentence:

"If the gentleman would go home he might learn the name of the person who set me upon that assassination which I now so much abhor."

The fact seemed now proved, which had always been believed that Fox was the instigator. Nor was this all that then leaked out, for Barre told several persons that on his reconciliation with Pitt, the latter told him that on the very day of his (Barre's) second attack on him, Fox had hurried out of the House after him (Pitt), saying, "He hoped he did not think that he (Fox) had any hand in encouraging the outrage, in which he vowed he was not concerned."

It was said that Shelbourne and Fox had set him on Pitt.

The King's hatred of Barre, second only to that he felt for Wilkes, prevented Barre's promotion in the army, and ultimately led to his retirement from the service in 1773.

Barre had also taken a prominent part in the affairs of India.

When the Rockingham Ministry came into power in 1782, Barre was appointed Treasurer of the Navy, and received a pension of £3,200 a year, to take effect whenever he should quit his then office, a proceeding which made the Ministry unpopular, and enabled the younger Pitt, some time later, to gain applause by granting to Barre the clerkship of the Pells in lieu of the pension.

When the Rockingham Administration was dissolved on the death of its chief, Lord Shelbourne formed the new Cabinet, and Barre was appointed Paymaster-General. This was his last official position, as he became blind a year or two later, a calamity that permanently cut him off from all active pursuits and all chance of further advancement.

But his active disposition could not long brook retirement, and after some time he re-entered Parliament, only to find, however, an entirely new order of things—new men, new ideas, new policies; and feeling himself a kind of political Rip Van Winkle, he in 1790 quarrelled with Lord Shelbourne, who had become Marquis of Landsdowne, owing to the complete divergence of opinions which had arisen between them; severed a friendship of over thirty years' standing, and again retired from Parliament for the last time.

Henceforth his health declined, and he spent the remainder of his days in retirement, dying at Stanhope street, Mayfair, London, on the 20th of July, 1802.

Owing to his services to America, his name was given to the district of Barre, in Massachusetts.

In 1848 a book was written by John Britton to prove that Isaac Barre was the author of the "Letters of Junius." But Barre denied their authorship to his friend, Samuel Bayard.

A recent author says that Barre was the most incorruptible patriot, successful exposer, and scathing denunciator of jobbery and corruption, and the most fearless friend of the then struggling colonies of America.

Henry Grattan says that on one occasion, when a great row took place in the English House of Lord's, Barre's remark on it was that "A bear-garden did not equal the horrid indecency of the peers."

The following ode bears witness to the popular appreciation of Barre's abilities and achievements:—

In different strains does Barre's language flow,
A rough-hewn soldier all from Top to Toe,
Like honest Kent, inured to homely ways,
He scorns the pliant courtier's mincing phrase;
And with a daring rectitude of thought,
Hangs in terrorum every statesman's fault.
No Bribes cajole him, nor no Fears repel,
For what he dares to think he dares to tell.
Is Britain's flag insulted on the Main?
Are laws infringed, should magistrates complain?
Do long arrears disgrace a Nation's trust,
Or those turn knaves who're paid for being just?
Then dauntless Barre takes his usual stand,
And flings his arrows with avenging hand
On every side—above, behind, below,
Nor spares the Monarch in his country's foe.
But tho' such praises on thy name attend,
Still Barre, hear the dictates of a friend
Who here would counsed with the openest view,
And what he freely thinks directs to you.
Let not that tongue so wantonly declaim
Nor stain a patriot with a brawler's name;
Illiberal phrases on themselves recoil,
And mar the statesman's zeal, the speaker's toil;
Contract the Muse's power to chant her lays,
And rob thy vigilance of half its praise.

From a friend of Prof. Pickering Harvard College has received a gift of £4,000 for the benefit of the College observatory. The very urgent need of the observatory will be at once relieved by this gift. The building provided nine years ago for astronomical photographs has become inadequate. Prof. Pickering intends to expend about half of the fund in extending the present building, in order to provide for the storing of the collection. The photographs furnish a history of the stellar universe for the last twelve years, and cannot be duplicated in any other observatory. They are of immense value in studying the past history of any part of the sky. The remainder of the fund will be expended as the needs of the observatory may demand.

A REMARKABLE MURDER.

AN EPISODE OF 100 YEARS AGO.

Under the above captions the "Wexford People" and the "Wexford Independent" of 26th ult., reproduced from the columns of the third number of this magazine, the account of the murder of Mr. Waddy, of Wexford, given in our "Glimpses of the Past." The "People" gives the following particulars concerning the persons named in the account:—

The Waddys lived principally at Clougheast Castle, Cottage, and Kilmacoe Lodge, as well as in Wexford, where some members of the family were noted lawyers and physicians. Our readers are familiar with the description given by Sir Jonah Barrington of Mr. Waddy securing himself in Clougheast Castle in 1798, so much afraid was he of the insurgents, who never had much reason for regarding him with friendship. . . . Mr. Ambrose Hughes and Mr. Robert Sparrow, who apprehended the murderer in Kilkenny, belonged to old Quaker families in Wexford town and its neighbourhood for two centuries past. Mr. Hughes was father of the late Mr. Wm. Hughes, wine merchant, whom we all remember, and who resided at the time of his death in Rowe street. A daughter of Mr. Ambrose Hughes's, Miss Anne Hughes, died not more than three or four years ago in Monck street, while his grandson and patronymic, Mr. Ambrose Hughes, with his brother, carried on the wine stores until succeeded by Messrs. Leverett and Frye in the house in Main street, Wexford. Mr. Robert Sparrow was a kinsman of the Hughes's and grandfather of the present Mr. Robt. J. Sparrow, Ballintlea, Taghmon. They, too, belonged to the "Society of Friends," and occupied in Wexford the premises on the quay held by the Catholic Club, and also Mr. James E. O'Reilly's establishment in Main street, succeeding the Webbs there. The Webbs, another Quaker family, were grandsires of the present Mr. Alfred Webb, formerly M.P. The Sparrows it was who erected the unfinished residence and laid out the demesne at Coolree, and also the pretty residencee at Ballintlea, occupied by Mr. Robert J. Sparrow, and also erected a cottage at Coolcots. The Sparrow and Hughes families have all disappeared, save Mr. Robert Sparrow, of Ballintlea, and his brother, who was married to Miss White, of Richmond House, now occupied by the Loreto Convent, the family who established White's Hotel more than a century ago. . . . The Friendly Brothers' Club was a benevolent society in Wexford previous to the Freemasons' Society. The chair of the old society it at present in the Freemason Lodge in Anne street, Wexford. The members, wearing green coats, formerly marched in procession through the town on St. Patrick's Day and on the occasions of the funerals of their members. It was dissolved about the year 1840, Capt. Cullen, a prominent figure in Wexford society about sixty years ago, who then resided at Slaney Villa, Spawell road, being the last secretary of St. Patrick's Friendly Brothers' Benevolent Club.

The "Wexford Independent" tells us that the Friendly Brothers were a well-known body in Wexford up to about 1842. It was an Irish organisation, something on the lines of the Masonic Order. They held their meetings regularly at fixed dates, and on every St. Patrick's Day marched to church in processional order, where an appropriate sermon was preached by the Chaplain of the Order. An annual ball and supper was given by them in the Assembly Rooms, which was always well atended. The last Hon. Secretary of the Order was Captain Cullen, who at the time was Barrack Master, a rather high position in Wexford in those days, there being a Deputy and a Sergeant under him. Captain Cullen resided in the house now occupied by Mr. John M. Walsh, proprietor of "The People." The members of the society, when writing their names, placed an "f" between the Christian and surname.

THE EMIGRANT'S FAREWELL.

(From the "Dublin Penny Journal," 1832.)

The last breeze from Erin
Has passed o'er my brow,
The gale of the ocean
Is over me now;
I leave thee my country!
Farewell! though thou art
The life pulse that stirs me,
The veins of my heart.
Erin mavourneen, farewell!

I gaze where the bright scene
Falls back to the west,
And tinges the blue clouds
That hang o'er thy breast:
The barque bears me from thee
To sail o'er the deep,
While on thy green bosom
I gaze—and I weep;
Erin mavourneen, farewell!

I weep, for thy spring-time
Of beauty is o'er;
And feel, while my dimm'd eye
Is on thy loved shore,
Like the mourner when, fixing
His gaze on the dead,
He bends o'er the cold earth
Whose spirit is fled;
Erin mavourneen, farewell!

The tear-drooping willow
Hangs o'er thy lyre;
The chill-blast hath broken
Each soul-stirring wire:
Through the gloom of thy darkness
No day beam appears;
And thy sweet type, Ierne,
Is gemm'd by the tears;
Erin mavourneen, farewell!

Farewell! for no longer
I gaze on thy shore;
The mists are between us,
I view thee no more!
Perhaps to my country
I breathe the last strain;
Perhaps I may never
Behold thee again;
Erin mavourneen, farewell!

Though in darkness, Ierne,
The sun may have set;
Thy emerald bosom
I ne'er can forget;
And while o'er the deep ocean
The breeze bears my barque,
My heart like its billow,
Heaves deeply and dark:
Erin mavourneen, farewell!

SPIRIT OF AN IRISH PIPER.

(From the "Dublin Penny Journal," 1832.)

Macdonel, the famous Irish piper, lived in great style—servants, grooms, hunters, etc. His pipes were small, and of ivory, tipped with silver and gold. You scarcely saw his fingers move; and all his attitudes, while playing, were steady and quiet, and his face composed. One day that I and a very large party dined with Mr Thomas Grant, at Cork, Macdonnel was sent for to play for the company during dinner; a table and chair was placed for him on the landing outside the room, a bottle of claret and glass on the table, and a servant waiting behind the chair designed for him; the door left wide open. He made his appearance, took a rapid survey of the preparation for him, filled his glass, stepped to the dancing-room door, looked full into the room, said, "Mr Grant, your health and company!" drank it off, threw half a crown on his table, saying to the servant, "There, my lad, is two shillings for my bottle of wine, and keep the sixpence for yourself." He ran out of the house, mounted his hunter, and galloped off, followed by his groom. I prevailed on Macdonnel to play one night on the stage at Cork, and had it announced in the bills, that Mr Macdonnel would play some of Carolan's fine airs upon the Irish organ. The curtain went up, and discovered him sitting alone, in his own dress; he played and charmed everybody.—O'Keefe's Recollections.

OUR WEEKLY STORY

IN TIME OF WAR.

A PHILIPPINE INCIDENT.

TA-RA-TA-RA-TA-RA! The blatant peremptory notes of the army "alarm clock," blared out on the bugle at the lips of a young soldier sounding the "first call to reveille," roused the infantry camp to instant if reluctant action.

"Confound 'em all!" growled Private Haskins, as he slothfully crawled out of the little tent that soldiers call a "pup-house."

"Who?" sleepily inquired Kochman, his tent-mate, who was already seated on the grass, dressing by the first light of dawn.

"All the idiots who wake us up at daylight," came the angry answer, as Haskins, having adjusted his trousers, began at the side-lacings of his leggings.

"A soldier ain't much good if he can't sleep all night and all day too," sarcastically rejoined Kochman, standing up and pulling on his khaki blouse over his thick blue shirt. "What did you come into the army for if your'e a sleeper?"

"I didn't know that the officers treated us like dogs—unlicensed dogs at that," growled Private Haskins, as he finished lacing the second legging. Kochman snorted—rather tolerably, to be sure— and glanced around to see all the inhabitants of the dog tents but four. The four tents belonged to the eight men who had gone out on the last tour of sentry duty in the night. They were still out, guarding the camp against the sudden surprise that meant death. Captain Miller and Lieutenant Gilbert, the two officers with the company, were out of their tent, looking over the camp with the keen glances of officers who knew their full duty and mean to do it.

. . . . . .

With a speed in dressing that would seem marvellous to civilians, the entirety of F Company was in its khaki field clothes, cheerfully ready for the work, fatigue, and fortunes of the day. The little camp lay in a tiny clearing in a forest of Samar. All about the Philippine jungle stretched thickly away. One solitary company of infantry, twenty miles from the coast and fifteen from the nearest town, was on the trail of unknown numbers of the active little brown men who employed death as their argument against Uncle Sam's sway in the far-eastern archipelago. There had been a chase, a skirmish, the day before. To-day there was every likelihood of a murderous pitched combat, the advantage to be with the side that saw the other first. Granted, of course, the American soldier is the better fighter, but there have not been wanting instances in which Filipinos have lured him into ambush and treated him with shameless deadliness.

"See here, rookie," admonished Kochman, his ordinarily good-natured Teutonic face betraying some distrust of the other's industry, "do you know that we've got about fifteen minutes for breakfast? You get your share of the wood, or you'll cook no coffee over my fire."

With a scowl Private Haskins followed his "bunkie" into the jungle. Within two minutes they had a brisk fire going, while both men, squatting on the ground, used the butts of their bayonets to grind the coffee beans furnished by the commissary department. To the grounds in their tin cups was added water enough, and the cups set over the fire for boiling. Strips of bacon were spread in ration cans, and these, too, were placed over the embers. In a very short time odours rose as aromatic as those that had come from the kitchen of any first-class hotel. Hardtack was added—that's all there is to a soldier's break-

fast in the field! Close to the two men already introduced squatted other groups of the lean, seasoned men of the F Company.

. . . . . .

Private Haskins swallowed his drink and food in silence at first. He was a recruit—a "rookie"—who had reached F Company only two days before. The first day had been bad enough—a day of marching through a sun-blistered country. Yesterday there had been a fight—merely a guerilla affair, in which two men of the company had been slightly hit. But Haskins, a luxury-lover and malcontent combined, already despised this career of absolutely hard work under the colours. As he ate, he wondered what would be the real risk in deserting.

"I'm thinkin'," said Sergeant Mullins, a little lean, grizzled man, of age impossible to guess, who had followed the fortunes of the army for twenty years on the western plains, "that we'll see but little more trouble the next few days."

"I should not," came disconsolately from Private Haskins.

"Now, rookie, who asked you to say anything?" tartly inquired Mullins. "New men in the army should be seen—not heard."

"After the battle yesterday——" began Private Haskins.

"Battle be—whanged!" roared Mullins. "You're a cold-foot—a man that's afraid to smell powder, I'm thinkin'."

"Crack! A half-mile away a rifle spoke. The Filipino bullet, aimed too high, described an arc, striking Haskins's plate between his knees and burrowing in the ground. Though his sullen scowl did not vanish, Haskins picked up the plate, still smeared with the grease of his scattered bacon, poised the dish for an instant, then launched it full in the face of Sergeant Mullins.

Slowly the sergeant wiped his face on the inner side of his haversack. Next, good-naturedly he tossed back the plate, remarking:

"I made a mistake, me boy. You're no cold-foot. Bullets don't rattle ye. If it's any satisfaction to ye, ye have the apology of Jim Mullins."

. . . . . .

Haskins, making no audible response, glowered at the ground. Recruit though he was, he knew he had committed a serious breach of discipline. He concluded that Mullins was a coward.

Two shots, unmistakably from "Krag" rifles, snapped out in the distance. Not one of the F men paid any heed; they were accustomed to these little affairs between sentries early in the morning. As they finished eating, each man washed his cup and ration can with a little water poured from his canteen.

"Look here! Whose rifle is this" spoke a sharp voice behind the men. Captain Miller, looking as spruce as though he had just stepped out of the tailor's, though he was twelve days away from civilisation, stood frowningly pointing at a gun that lay on the ground before one of the pup-houses.

"It's mine," admitted Haskins, in no very amiable tone.

"Say 'sir,' when you answer me," came the captain's firm rebuke.

"It's mine, sir," Haskins almost growled.

"What is it doing in that shape, my man" demanded the captain. "Do you understand that a soldier's first duty is to keep his rifle in condition for its work?"

"Yes," Haskins grudgingly admitted.

—"Sir"

"Sir!"

"Yet the muzzle is sticking in the ground, and choked with damp soil," continued Captain Miller, picking the piece up and slowly examining it. "The barrel is as foul as a city sewer. I've never seen a worse gun."

Haskins remained sitting on the ground, scowling ahead of him. The other men had risen to their feet, standing respectfully at attention.

. . . . . .

"My man," resumed the captain severely, "you not only keep your piece in the worst possible condition, but your uniform, though you've been with us but two days, shows gross slouchiness. Moreover, though you've spent three months at recruit camp, you don't seem to know enough to rise in the presence of an officer. Get up!"

Grudgingly Haskins rose.

"I'm sorry for you, my man," said Captain Miller, turning away. "I fear you'll prove a disgrace to the American army. Sergeant Mullins, you're an old soldier. See what you can do with him."

"Yes, sir," replied the sergeant, and saluted. Then, as the captain walked away, the sergeant wheeled about, put his arm through the recruit's, and led him a few paces away.

"You've got a few things to learn, me boy," quoth the older man. "One of them, in the army, is that your own opinion don't count. The next is——"

"Look here," cried Haskins, angrily, breaking away from the friendly grip of his counsellor, "I don't want any nonsense. If the United States want men to fight their battles they've got to treat them like men!"

"And don't they?" demanded Mullins, his eyes kindling.

"Perhaps the country intends to, but the officers——"

—"Well, what—?" demanded Sergeant Mullins, halting under the shade of the nearest maze of jungle. His eyes should have warned the recruit.

"Captain Miller—" began the man, passionately.

"Is a gentleman," finished Mullins, gravely. "He went to West Point, but that was to learn how to be an officer—not a gentleman. I don't know his father or mother, but Captain Miller was born a gentleman."

"He 'cussed me out' before the company."

"And ye deserved it. It's no disgrace to be a green rookie, but 'tis a cryin' shame to be a kicker—an army lawyer!"

Haskin's fists clinched, his face taking on a deeper purple hue.

"Miller is not a gentleman," he cried, savagely. "He's a cur! He's——"

Whump! Sergeant Mullins's fist shot out straight, catching the recruit under the chin. Haskins went to the ground like a felled tree. But he was a powerful young fellow. He leaped to his feet with murder in his eyes. Sergeant Mullins was so slight a fellow that he seemed like a snowflake in the way of a lightning-bolt. Yet he caught the recruit with a left swing that he had learned at Fort Snelling. Haskins now realised the need of caution. Trained fairly well in the ways of personal encounter, he rose as if groggy, then suddenly plunged his head at the sergeant's abdomen. Mullins lightly raised his foot—a trick acquired from the Mexicans on the Texas frontier—caught the man in the jugular, and keeled him over decidedly dazed.

"What's the meaning of this row? Sergeant, this is no way to break in recruits," sounded an angry voice.

Mullins turned just in time to perceive his captain striding up, while fifty interested men hovered in the background.

"Nothing but a bit of sport, sir," replied the sergeant saluting, while Haskins painfully regained his feet. "We had a friendly dispute, sir, about the relative values of different methods of sparring, and stepped over here to find out which had the best notions."

"H'm!" quoth the captain, gravely. "Don't carry it too far." With which admonition he turned and strode back to his own tent. By the time that he was under canvas some of the onlooking men raised a faint cheer.

Haskins made a move as if he would chance another blow.

"Hold up!" commanded Mullins. "Go back to your bunkie and try to be a real man. I've patience with a green man if he's got any real stuff in him."

Saying which he turned contemptuously on his heel, leaving the private to follow him back to camp.

. . . . . .

In the meantime ten men and a non-commissioned officer had started to the front. As the two late belligerents made their way towards the tents a dozen shots quickly rang out. These shots were fired by "Krags," the American guns, as every old soldier knew. Fifteen seconds later there came a rattling volley from Mausers. The little reconnoitering party from F Company had struck the enemy in force. In an instant Captain Miller was outside his own canvas.

"Strike your tents, men!" he shouted. "We must go forward at once."

Three minutes later the "assembly" blew out. All the while there had been intermittent American firing a little way off, with steady replies of Mauser fire. Many of the Filipino bullets, aimed too high, had struck the ground on which the soldiers laboured. At "assembly" the men fell in, heavily burdened with tent-rolls, blankets, food-laden haversacks, canteens, and ammunition. They were going into a matter the issue of which was life or death, but they didn't look it. The American infantryman marches into action with the easy indifference of a gang of labourers strolling to their work. As they struck the jungle path single file became necessary. Each man had to keep one hand in front of him to fend off swinging twigs left in motion by the passage of his predecessor. And so they plodded on, coming soon within the zone of fire that the excited Filipinos were keeping up. A man was struck in the leg, sinking to the ground with a word or a moan, while the acting hospital steward, in the absence of a surgeon, hurried back to him. Kuchman received a bullet through the brain; he never stirred after his limp form struck the ground. Haskins frowned, twitched at the mouth, but quickly closed up the gap in the line left by his dead "bunkie." Sergeant Mullins, a little way behind in the line, noted the conduct of the rookie, and nodded in semi-approval. through the hollow trunks the Mauser bullets came crashing, making the worst, most nerve-racking sound then audible.

. . . . . .

There came an instant's halt. As quickly as it could be done in the jungle the men were deployed out into a thin skirmish line, the soldiers nine feet apart. In this order, though minus two more men hit, they came upon the little reconnoitering party. It took Captain Miller but a few moments to locate the position of the enemy, intrenched at the military crest of a hill that lay just beyond the clearing ahead of them. There was no use in lying there, firing at seven hundred yards' range.

"Steady, men!" Then: "Sound the charge, bugler!"

With a yell as gleeful as that of schoolboys turned loose for the rest of the week, the men of the F Company leaped into the clearing, received a volley that staggered them for an instant, and then on up the hill they rushed, like the rising of a summer storm. As they ran, some fixed their bayonets; others slipped cartridges into their rifles; still others gripped their pieces by the muzzles, ready to bring down the butts upon the heads of the little brown men when the two forces met hand to hand. The khaki-coloured line, thin as it was, did not falter once, even if three hundred brown men were firing at them from behind the shelter of a deep trench. While the Americans were still seventy-five yards away, the little enemy broke and fled. Miller's men of the F Company gained the trench and jumped into it, though they had left behind three men killed and eight wounded. As the men leaped into the trench they paused a moment to regain their breath, then began to fire at the Filipinos, vanishing over another earth-wall at the top of the hill, two hundred yards away. It was now a fight between two entrenched forces—but a trap. The wall on the side towards the enemy was a "blind" embankment—a mere thing constructed of bamboo splits and

loose rubbish that did not stop a single Mauser bullet. A deafening volley from above, and four more men were wounded.

"There must be fully eight hundred of the rascals above," grumbled Captain Miller to his subordinate.

"Fully that, sir," coincided Lieutenant Gilbert, shouting in order to make himself heard over the din of the rifles.

"We can't stay here in the open. We'll have to get back to the jungle. There we may be able to trap the rascals."

Gilbert nodded. Quick orders were given to the wounded to make their escape to the rear. Ninety seconds later, with two more added to the list, F Company made its wise retreat down the hill. As they rose a wild cheer came from the enemy. The hill above was dotted with exultant Malays swarming after them. Miller had gone forty yards when he heard a despairing yell above. Without an instant's hesitation he turned and sped back—alone—to the trench. He gained it, with four bullet wounds in his uniform and a bloody scratch on his left arm. The enemy were now close at hand, firing wildly as they advanced. Much of their practice was directed at the solitary figure of the captain, standing well defined against a sky-line. It was miraculous that Miller did not fall with fifty bullets in him, but he paused long enough to glance down the ditch. There lay Haskins, shot through the left leg, unable to rise. A few bounds carried the captain to the rookie's side.

. . . . . .

"Put your arms around my neck, my man," ordered the commander, as he stooped and picked up the recruit with a skill and tenderness acquired from practice. Burden and bearer left the ditch, Miller's agile legs doing their best in the mad race between himself and the foremost Filipinos. Haskins, groaning lightly with the pain, lay passive, but he was conscious that the captain was carrying him so as to shield him with his own body from the flight of bullets that overtook them. Mullins and a half-dozen other soldiers, realising what was taking place, turned, threw themselves face downward, and fired as fast as they could to check the crowding enemy. In five minutes more F Company was safe in the jungle, annoyed only by a scattering fire from the little brown men, who did not dare follow into that maze. The Filipinos knew the danger from American ambush.

Haskins and some of the other wounded were sent down to the town of Basingan, on the coast, where they were treated at a military station that lay safe under the protecting guns of a little "tin-clad" gunboat. Sergeant Mullins, who had been hit in the shoulder while covering the retreat of the captain and his rookie, was ordered, much to his disgust, to the same station. Haskins lay in bed. Mullins, lying off in a big bamboo chair in the same room of the large nipa house that served as hospital, addressed the recruit:

"Now, me boy, what do you think of your officers?"

"The same as ever," grumbled Haskins, weakly. "We men are dogs—or, at best, machines."

"Is it so?" roared Mullins, wrathfully. "Ye say that, and yet the captain saved your life."

"Probably he thought he might need me another time."

"I'm sorry for him if he does," retorted Mullins, promptly. "See here, me lad, ye've no more manhood in ye than a goat has—beggin' the goat's pardon. I've a shoulder that's a trifle bad, but if ye had two good legs to stand on I'd teach ye a decent American spirit towards your officers—them that's gentlemen, I mean. Captain Miller has a wife and three children He staked their happiness on saving a dog like you. That's all I have to say to you now!"

For two weeks Haskins lay in bed, nursing his grievance against officers. Even the surgeon irritated him. Mullins left hospital before the recruit was up. The sergeant's last words conveyed the impression of a belief that the recruit would ever be worthless as a soldier. He advised the private to leave the army for ever as soon as his three years were up.

. . . . . .

"Be sure that I will," retorted Haskins.

"And meantime, keep your mouth closed," snapped the sergeant, just before leaving the room. "There's some of us that's been long enough in the service to know that our officers are men. If you keep your mouth closed you may save your teeth."

Left behind, Haskins resolutely and sullenly went over every rebuking word that had ever been said to him by an officer. These gentlemen with the shoulder-straps were prigs, snobs, and bullies. Once he was out of the service he would enjoy meeting as many of them as possible and offering his opinion of them. Haskins had once been a school-teacher in a New England village, but had thrown up that employment because the members of the school committee thought they knew more than he did of the requirements of his position. He had hoped to find men in the army, but was satisfied now that the officers were overbearing brutes, while the men who submitted to their discipline were fawning curs.

It was five weeks later when Private Haskins, travelling with an escort train, rejoined his company, now stationed twenty miles inland. As a matter of course he reported to Captain Miller, quartered in a comfortable nipa house in the town of Paltog. Miller, seated at a table and scanning the company's clothing report, looked up as he heard the man enter.

"Oh, it's you, Haskins?" asked the captain, pleasantly, as the private sullenly saluted. "I'm glad to see you back. Hope you didn't leave the hospital too soon?"

And he held out his hand to the private. That would have been a very unusual procedure in a home barracks, but the captain, who loved his company, was willing to defy the regulations laid down for the social non-intercourse between officers and men. Haskins took the outstretched hand, clasped it lightly, clammily, then stepped back again and saluted.

"Shall I return to duty, sir?" he asked abruptly.

"Yes; go to your sergeant," returned the captain. Surprise showed in his clear gray eyes as the recruit walked out. Haskins had apparently forgotten to express thanks for the gallant rescue that had saved his life.

. . . . . .

Nor did Haskins improve in any respect during the next few days. He still hated all officers, and regarded himself as a man who had written himself down a dog by entering the army for three years. Haskins kept as clear as possible from Sergeant Mullins, but tried to find one or two other malcontent spirits among his fellow-privates. Within three days he had succeeded in making himself the man without a friend in F Company. He wondered why. Only Miller and Gilbert, while keeping strictly within the prescribed limits of their dignity of officers, tried once in a while to break down the sullen reserve and undercurrent disrespect of the dissatisfied man. They failed repeatedly, and now and then found necessity for more or less stern rebuke—but they did not cease trying to make good material out of this unpromising rookie.

Then there came a morning—a terrible morning that must ever be regarded with distress by Americans. There had been peace for weeks—no signs of an armed enemy about. It was all due to that fatal error of overconfidence and underestimation of the enemy's abilities, resourcefulness, enterprise. Whether the fault should be ascribed to the officers or the men of the F Company—or was to be equally divided between officers and men—no one perhaps will ever know. Certain it is that, in the seeming security of life at Paltog, outpost duty had been a good deal relaxed. The native president of the town, installed in a lucrative office by Captain Miller, had during the night before led a force of more than one thousand Filipino insurgents to the town, and had posted them as near as possible to the street occupied by the officers and men of F Company.

While the men of F Company were eating their bacon and sipping their pints of black coffee around little fires in the main street of the town, a signal shot was heard. The bullet tore up the dirt, throwing it over three or four men. Not more than two seconds later a gust of bullets swept down the street, knocking over several of the men ere they had time to rise to their feet. Miller was first up. His commands rang out sharp and clear. The enemy were posted on the slopes on three sides, the ranges running from two to three hundred yards. Fully twenty men had no chance to get upon their feet before they were struck.

Selecting like a flash the point at which the insurgents seemed to be most strongly posted, Miller tried to lead his soldiers forward. The effort was useless. Men dropped so fast that it seemed as if the command was being wiped out by lightning bolts. In a choking voice Miller ordered his men to lie down and fire as fast and straight as they knew how. But it was hopeless.

"Gilbert!" sounded the captain's voice, "this means extinction. It's of no use to fight. The ravine at our rear seems to be clear. I think we had better get as many of our men as possible down that way. Some of them may escape."

. . . . . .

"You're right, sir, —— it!" came huskily from the lieutenant. "The enemy——"

That was as far as the lieutenant got. A Mauser bullet entered his brain. Miller felt a sob choking at his throat. Then, rising to his feet, determined to save a portion of his command, if possible, he gave the order to rush for the ravine. The dead of F Company littered the street. There were not enough unhit men to make any attempt to carry off the wounded. And the air, just above the street, was fanned into vibrating action by the passage of thousands of bullets. It was necessary for the bugler to sound the "retreat," that the small remnant of the company might hear the order. Miller's smoking revolver was flourished towards the ravine. Down the street fled the fugitives, dashed into the ravine, and still kept running.

Haskins was among the last to reach comparative safety. Wonderingly he glanced back, saw Captain Miller, the last of the command to leave, within fifty yards of the scene of the first slaughter, and with scores of the little brown insurgents in pursuit. Even as Haskins looked, he saw his captain fall. There was a brief choke in the private's throat. Then, in sudden desperation he ran back, yelling like a Comanche, and emptying the magazine of his rifle as he ran. Sergeant Mullins, a little nearer the ravine, turned and saw what was taking place. Though wounded in the hip, he gave a hoarse cheer and started to wriggle back, slipping cartridges into his piece. From the houses of the natives brown men rushed out, hauling firewood after them, and laying it in piles in the street. They and the insurgent soldiers dragged the bodies of the slain and wounded and laid them on the pyres. A dozen matches were struck, and the wood began to blaze.

Sick at heart, with empty rifle, Haskins darted into this street of Hades. Dropping his rifle, he stopped but a second to pick up the body of his captain. Never pausing to see whether that officer still breathed, the recruit turned and fled. He was but thirty feet from the nearest Filipinos when he started, but his long, sinewy legs rapidly made the distance better. Realising that their prey was escaping them, the Malays stopped and began to fire. A single rifle—Mullins's—almost in Haskin's face, gave the reply, at the rate of a shot every two seconds. Two of the Filipinos dropped.

"Put me down, my man, and save yourself," came the faint order from Captain Miller. "There's no chance for both of us."

"Then we're both doomed, sir," panted Haskins, a new light shining in his eyes.

Reloading his rifle, good old Mullins struggled to his feet, and slowly, painfully, retreated with them, reaching the last ravine.

. . . . . .

Here they found the survivors, eleven others, some of them more or less seriously hit ,but all halted by Corporal Butler, the only non-commissioned officer not struck. The men set up a wild cheer as they caught sight of Haskins, his burden, and the bleeding sergeant trailing in the rear.

"Don't crow, men," remonstrated Captain Miller, as Haskins laid him tenderly on the ground. "How many men are without a scratch? Five? Then Basingan is our destination. Forward, as quickly as we can go. Behind us are a thousand of the brown devils. We can't talk of revenge with much less than a battalion. Forward, as soon as you get your wind."

So the procession started, with three men in advance and four as rear-guard, the rest, Haskins among the number, keeping with their captain, who lay on a crude bamboo stretcher. They travelled as only men can who have been whipped and know that it is hopeless to try to retrieve the defeat. There were two or three alarms along the way, and not much time devoted to camping for rest. In the afternoon of the following day they reached Basingan. Within two hours the advance guard of a punitive expedition was on its way to Paltog, and two hours after that other troops, hastily sent for, were disembarking on the beach. But every dead and living body left behind in the little town of Samar had been swiftly cremated by the brown victors, who, in turn, had safely retreated from the wrath to come.

Shot through the lower edge of the right lung, Captain Miller lay in the best room of the nipa-thatched hospital at Basingan. He was certain to recover, the army surgeon said, and was permitted to have visitors. Sergeant Mullins, who refused to go to bed, and who was able to hobble about, was in the same room with his captain.

"Can I come in?" asked a voice, and Private Haskins, with his hand at his sombrero in prolonged salute, stood at the door of the room.

Mullins glanced at his chief, who nodded, and the recruit entered softly. Going over and kneeling beside the bed, Haskins took his captain's hand gently in his.

"I've come to beg your pardon, sir," began the recruit, huskily.

"For what?" demanded Miller, in palpable surprise.

"For not thanking you, sir, for that time when you saved my life."

"I guess we're even, Haskins. You certainly saved mine."

"But I have acted like a cur, sir. I always hated you, sir—I suppose because you were a captain and I was a private. I thought officers treated men like dogs—but you ought to have done it, sir—for I was one."

"Hush!" commanded the captain, stretching his nearer arm around the recruit's neck. "I know a good man, even if he doesn't know himself at first."

"Will you forgive me, sir, and give me a chance to show that I can be a decent soldier?" asked Haskins, almost inaudibly.

"There's nothing to forgive," replied the captain, quietly. "As to your being a good soldier—Sergeant Mullins!"

"Yes, sir," replied the old non-com., hobbling over to the bedside.

"Can you find any flannel"

"I guess the surgeon has some, sir."

"Get it, and when you feel able, cut out a pair of corporal's chevrons for Private Haskins."

"Yes, sir," replied Mullins, and gave the private a queer glance.

"How old are you, Haskins?" asked the captain, after a few moment's pause.

"Twenty-four, sir."

"And you've been well educated"

"I suppose so, sir."

"Then you have four years in which to earn a lieutenant's commission from the ranks. Get it, if you can. I'll help you as much as possible. If you win out—and God grant you may—then you'll know a lot more by that time about the old, old game of officer and man. Good-night."

"Good-night, sir!" Haskins went out on tip-toe and softly closed the door after him.

GREEN HILLS OF ADAIR.

BY WILLIAM D. GALLAGHER.

How oft in the spirit we yearn
For faces and forms that have fled!
While the calm lights of memory burn,
How oft from the living we turn
To the dead!

So my thoughts now go wandering back,
O'er a quiet and shadowy track,
Till they rest by a murmuring stream,
Where in years gone I dreamed a sweet dream,
Among the green hills of Adair—
The beautiful hills of Adair.

And a maiden as sweet as the flowers
That bloomed by that murmuring stream,
Walked beside me among the wild bowers,
Thro' the months, and the days, and the hours
Of that dream.

But a messenger cruel as Death
Broke in on that dream, and her breath
Passed away with a prayer and a sigh,
As that murmuring stream glided by,
Among the green hills of Adair—
The beautiful hills of Adair.

But I wander there yet, and I hear
The tones of that murmuring stream;
And the form and the face that were dear,
In the beauty of youth reappear;
And I dream—

Oh, I dream of a land and a life,
Lying far beyond earth and its strife,
Wherein, not again to be crossed,
I shall find the sweet spirit I lost
Among the green hills of Adair—
The beautiful hills of Adair.

EARL OF DESMOND.

(From the "Dublin Penny Journal," 1832.)

The castle of Mogeely, in Ireland, two miles from Tallow, was a principal seat of the Desmond family. At this castle resided Thomas, the great Earl of Desmond, who had a favourite steward that often took great liberties with his lord; and by his permission, tyrannised over the Earl's tenants equally with his master. The steward, unknown to the earl, gave an invitation in his lord's name to a great number of the chiefs of Munster, with their followers, to come and spend a month at this castle. The invitation was accepted, and a crowd of gentlemen flocked in, to the great surprise of Desmond, who began to be alarmed lest sufficient provisions should not be found for such a number of guests. They had not staid many days, when provisions in reality began to fail; and at last the earl's domestic informed him that they could not furnish out a dinner for the next day. The earl knew not what to do, for his pride could not brook to let his guests know anything of the matter; beside his favourite steward, who used to help him in such difficulties, was absent. At length he thought of a stragatem to save his credit; and inviting all his guests to hunt next morning, ordered his servants to set fire to the castle as soon as they were gone, and pretend it was done by accident. The earl and his company hunted all the forenoon; and from the rising grounds he every moment expected with a heavy heart to see Mogeely in flames. At length, about dinner time, his favourite steward arrived, mounted upon a fresh horse. The earl threatened him severely for being so long absent at such a juncture. The steward told him he had arrived just in time enough at the castle to prevent his orders from being executed; and farther, that he had brought a large supply of corn and cattle, sufficient to subsist him and his company for some months. The news not a little rejoiced the earl, who returned with his guests to the castle, where they found sufficient plenty of everything they wanted.

LITTLE JOHN IN IRELAND.

(From the "Dublin Penny Journal," 1832.)

Stanihurst tells a singular story about Little John, the notable companion of Robin Hood. We may as well give the matter in the words of the author, whose curious information is set off by his singular style of narrative, which to an antiquarian is as "apples of gold in pictures of silver."

Speaking of the Oxmantown-green, he says—"In the farthest end of this field is there a hole, commonly termed Scald Brother's hole, a labyrinth reaching two large myles under the earth. This hole was in old tyme frequented by a notorious thiefe, named Scald Brother, wherein he would hide all the bagge and baggage he could pilfer. The varlett was so swift of foot, as he hath eftsoones outrun the swiftest and lustiest young men in Ostmantown (Oxmantown), maugre their heads, bearing a potte or panne of theirs upon his shoulders, to his den. And now and then, in derision of them that pursued him, he would take his course under the gallows, which standeth very nigh his cave (a fitte signe for such an inne), and so being shrouded within his lodge, he reckoned himself cocksure, none being found at that tyme so hardy as would adventure to entangle himself within so intricate a maze. But as the pitcher that goeth often to the water, cometh at length home broken, so this lusty youth would not surcease from open catching, forcibly snatching, and privy prowling, until he was by certain grouping groomes, that lay in wayte for him, intercepted fleeing towards his couch—having upon his apprehension, no more wrong done him than that he was not sooner hanged on that gallows, through which in his youth and jollity he was wont to run.

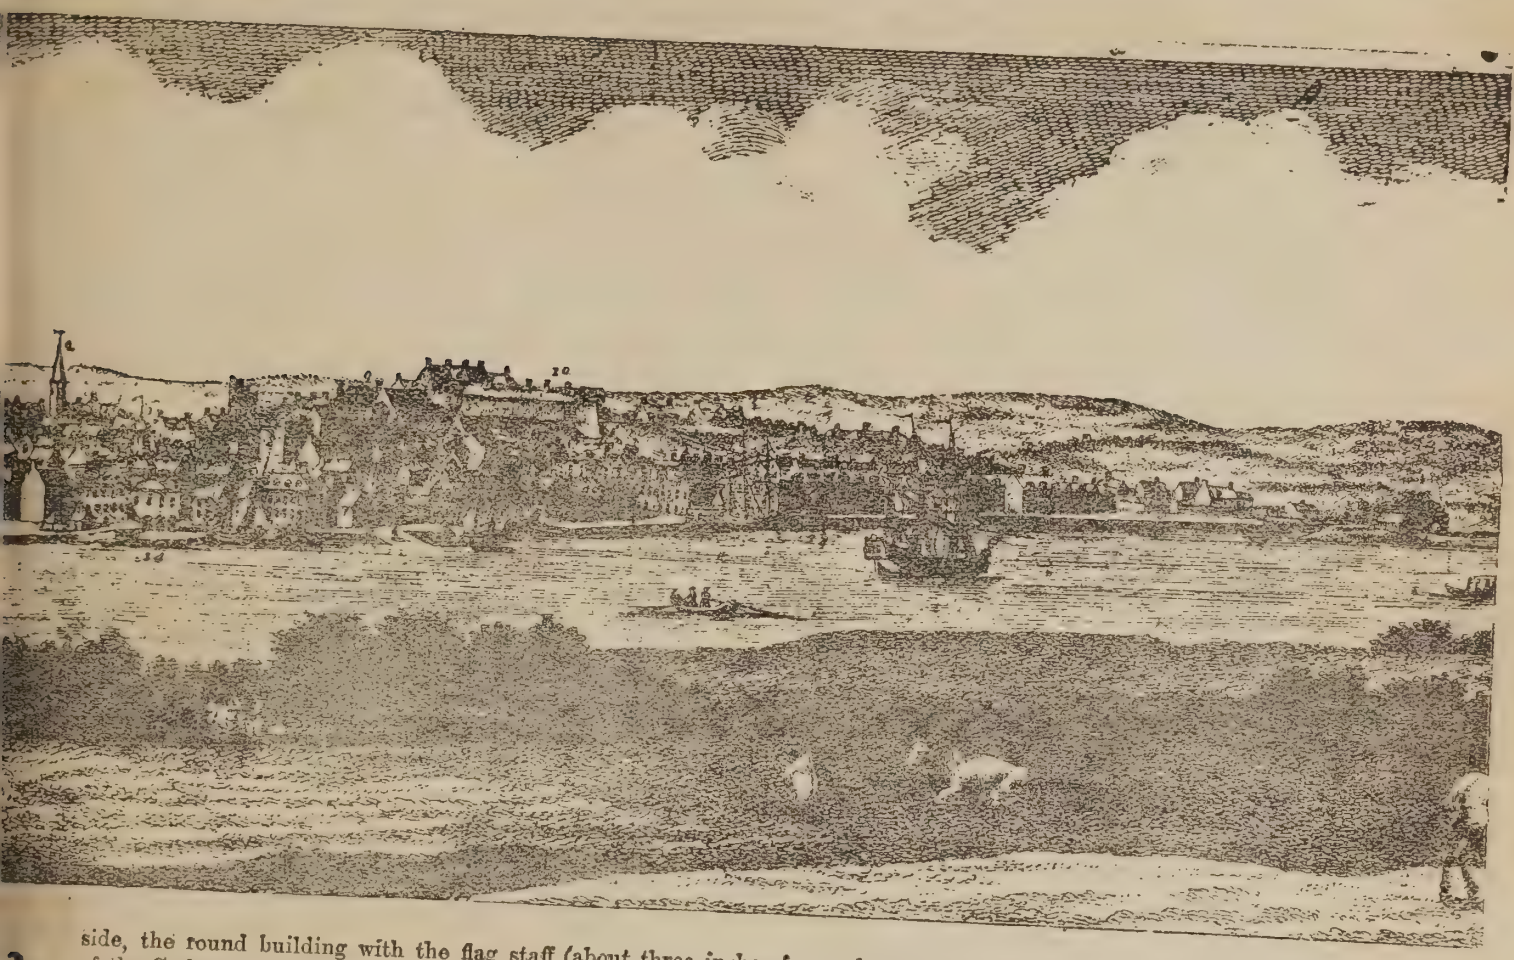
"There also standeth on Ostmantown-green a hillock, named Little John his shot: the occasion preceded of this:

"In the year 1819, there ranged three robbers and outlaws in England, among which Robert Hood and Little John were chieftains; and of all thieves, doubtless, the most courteous. Robert Hood being betrayed at a priory in Scotland, called Bricklise, the remnant of the crue was scattered, and every man forced to shift for himself. Whereupon Little John was fayne to flie the realme, by sayling into Ireland, where he sojourned for a few days at Dublin. The citizens being to understand the wandering outcast to be an excellent archer, requested him hastily to try how far he could shoot at random; who, yielding to their request, stood on the bridge of Dublin [the same that now leads from Bridge street to Church street,] and shot to that mole-hill, leaving behind him a memorial rather by his posterite to be wondered at, than possibly by any living man to be counterscored. But as the repayre of so notorious a champion to any country would soon be published, so his abode could not long be concealed; and therefore to eschew the dangers of laws, he fled to Scotland, where he dyed at a town or village called Moranny. Gerardus Mercator, in his cosmographye, affirmeth, that in the same town the bones of a huge and mighty man are kept, which was called Little John; among which bones the huckle bone or hip bone was of such largeness as witnesseth Hector Boethius, that he thrust his arm through the hole thereof; and the same bone being suited to other parts of his body, did argue the man to have been fourteen feet long, (!!) which was a pretty length for little John: whereby appeareth that he was called little John ironically, like as we terme him an honest man, whom we take for a knave in grayne."

A London secondhand bookseller is offering, in his catalogue, the potentiality of literary fame. He advertises a budget of "skeleton projects" in the manuscript of a deceased author. These projects are for "really solid and great works," some of which have been anticipated, while others remain fallow. "To the antiquarian, bibliographical, and critical scholar in search of fresh ideas, the volume should prove a desideratum." The young lions, we know, lack and suffer hunger, but a scholar so jaded as to be in search of fresh ideas is hardly likely to "find himself" in this way. Probably the bookseller has a very good inkling of this, since for all these projects, "the majority of which lie in the womb of the future," he asks only six shillings, the price of one completed novel.

WATERFORD AS

THE above picture gives the south prospect of the city. The following are its conspicuous features:—Beginning at left hand left being The Mall. The belfry next seen to the right (marked 4) is that of the French church; the next (marked 3) is that is seen the steeple of The Tholsel (2). The flag staff half an inch to the right and much lower is that of The Exchange. Rising All along the front (marked 14) stretch the quays.



WATERFORD CITY.

Its History, Antiquities, &c.

From Lewis's "Topographical Dictionary of Ireland."

WATERFORD, a seaport, city and county of itself, and the seat of a diocese, locally in the county of Waterford, of which it is the capital, and in the province of Munster, 67 miles (E. by N.) from Cork, and 75¾ (S.S.W.) from Dublin; containing 28,821 inhabitants, of which number, 26,377 are in the city and suburbs. The ancient name of this place is said to have been "Cuan-na-Giroth" or "Grian," signifying in the Irish language, "The Haven of the Sun;" it afterwards obtained the appelation of "Gleann-na-Gleodh," or "The Valley of Lamentation," from a sanguinary conflict between the Irish and the Danes, in which the former, who were victorious, burnt it to the ground. By early writers it was called "Menapia," under which name was implied the whole district, and by the Irish and Welsh, "Portlargi," "the Port of the Thigh" (from the supposed similitude which the river at this place assumes to that part of the human body), which it still partly retains. Its more general name, Waterford, which is of Danish origin, and supposed to be a corruption of "Vander-Fiord," "the ford of the Father," or of Odin, a Scandinavian deity, was derived from a ford across St. John's river, which here falls into the river Suir. The original foundation of this city is by some writers referred to the year 155; but its antiquity as a place of any importance cannot be traced beyond the year 853, when it is said to have been built by the Danes or Ostmen, under their leader, Sitiricus or Sitric. The city, for that period, was a place of great strength, surrounded with walls; and the scattered notices of this colony which are still preserved show that the inhabitants maintained among themselves an independent sovereign authority, and that they were for a long time the terror, if not the absolute masters, of a vast extent of country. Up to the time of the English settlement, this colony had strictly avoided all intimate connection with the native inhabitants of the country, and had preserved all its ancient customs, manners, and character unchanged. In 893 it is recorded that Patrick, son of Ivor or Imar, King of the Danes of Waterford, was slain; and in 937, that the Danes of Waterford wasted all the county of Meath. According to the annals of Tigernach, Imar, King of Waterford, laid waste to the county of Kildare; and in 995 he succeeded Anlaffe in the occupation of Dublin; he died in the year 1000, and was succeeded, in 1003, by his son Reginald, who built the celebrated tower known by his name, corruptly called Reynold's and now the Ring tower. This tower was erected in 1003, and is said to be the oldest in Ireland; in 1171 it was held as a fortress by Strongbow; in 1463 a mint was established in it by Edw. IV.; and in 1819 it was rebuilt and formed into a police barrack. Another Imar of Waterford is recorded to have been slain, in 1022, by the king of Ossory, and to have been succeeded by a son Reginald, styled by the Irish O'Hiver, who in the same year was killed by Sitric II. In 1038, Cumana, king of the Danes of Waterford, was killed

WAS IN 1745.

side, the round building with the flag staff (about three inches from edge of picture) is the Ring Tower, the open space on its of the Cathedral. About an inch to the right of the latter is the belfry of St. Olave's (7). Two inches to the right of the latter above the crest of the hills is on right of this a group of buildings, consisting of St. Patrick's, and, highest of all, the Barracks.

by the people of Upper Ossory, or, as is otherwise stated, by the treachery of his own subjects; and in the same year the city was burnt by Dermot Mac-mel Membo, King of Leinster; it was also again burnt in 1087 by the people of Dublin. The Danes of this place having, in 1096, embraced the Christian religion, elected Malchus, a Benedictine monk, who had been for some time at Westminster, for their bishop; and sent a letter to Anselm, Archbishop of Canterbury, to request his consecration, which was granted; and Malchus, on his return, assisted in the erection of a cathedral, which was dedicated to the Holy Trinity, and is now called Christ-Church. It appears that, about this time, there was a mint at this place, a silver coin having been found with the inscription "Wadter" on the reverse, and attributed to one of the Danish kings. In 1171, after the taking of Wexford by Hervey de Montemarisco and his companions, Raymond Le Gros landed, in May, at Dundonolf or Dundrone, four miles from Waterford, with a force of 10 knights and 70 archers, sent as an advance guard by Earl Strongbow, who had spent the whole of the preceding winter in preparation for the invasion of Leinster, in support of the deposed sovereign Dermod M'Murrough. This party, for their immediate security, threw up an intrenchment and a temporary fortification, which was soon attacked by an irrégular force of 3,000 men, consisting of the Danes of this place and the troops of the princes of Decies and Idrone. The English retreated from this formidable superiority of numbers into their fort, and the Irish pressing closely upon them were partly within their gates, when Raymond slew their leader; and his associates, animated by his example, compelled the assailants to retire. Raymond ordered a numerous herd of cattle collected by the English from an adjacent country to be driven furiously against the retiring army, which was thus thrown into confusion, and seizing the advantage, rushed with impetuosity upon the disordered troops and gained a complete victory, committed dreadful slaughter, and returned to the fort with 70 captives, all principal inhabitants of the city. These offered large sums for their ransom, and promised to surrender the city as the price of their liberty; but Raymond, listening to the advice of Hervey de Montemarisco, adopted the barbarous policy of putting them all to death. Raymond and Hervey waited here for the arrival of Earl Strongbow, who, on the eve of the festival of St. Bartholomew, appeared in the harbour and landed with 200 knights and 1,200 infantry, all chosen men and well-appointed soldiers. Strongbow was immediately joined by Raymond and his party, and on the following morning marched in military array to attack the city, which had received considerable reinforcements from the neighbouring chieftains, and was prepared for a vigorous defence. The English were twice repulsed, and twice returned to the attack, when Raymond, perceiving a house of timber projecting from the eastern angle of the city walls, and supported on the outside by posts, prevailed on his men to make a third assault and direct their whole force against this quarter. They began by hewing down these posts, and the house falling, drew away with it such a portion of the walls as made a breach wide enough to admit the besiegers, who rushed in, bearing down

all opposition, and the city became a scene of indiscriminate carnage and rapine. Reginald, King of the Danes, and Malachy O'Feolian, prince of Decies, had been seized and were just on the point of being put to death, when the sudden arrival of Dermod M'Murrough, King of Leinster, and his forces, with Fitzstephen and other English leaders, perverted further slaughter. Dermod embraced his new associates, and introduced his daughter Eva to her affianced husband, Strongbow; the marriage having been immediately solemnised, he departed with his allies, and leaving a sufficient garrison in Waterford, proceeded to lay siege to Dublin.

Earl Strongbow, on his return from the conquest of that city, with the lordship of which he was invested, received a summons from Hen. II., who was at that time in Normandy, to attend him; and leaving his forces quartered in Dublin and Waterford, he obeyed the summons, and offering to deliver up to the king these cities and other principal towns, on condition of having the remainder of his acquisitions confirmed to him and to his heirs, the king agreed to his proposals, and immediately prepared to follow him to Ireland. Henry's fleet, consisting of 240 vessels, having on board from 400 to 500 knights and 4,000 soldiers, arrived in Waterford Harbour in October, 1172; and on the festival of St. Luke, the king landed to take possession of the kingdom as its rightful sovereign, by virtue of Pope Adrian's bull, and was joyfully received by the English, and by the Irish nobility who were in alliance with them. Strongbow immediately made a formal surrender to the king of the city of Waterford, and did homage to him for the principality of Leinster; and Henry received here the submission of the people of Wexford, and of Dermot M'Carthy, King of Cork. He afterwards proceeded to Lismore, Cashel, Dublin, and other principal towns; and on his return to England, aware of its great importance as one of the principal maritime towns, he left the city of Waterford in the custody of Humphrey de Bohun, Robert Fitz-Bernard, and Hugh de Gundeville, with a train of twenty knights. A new garrison was soon afterwards placed in the city, which at the same time was greatly enlarged, and surrounded with new walls; the old fortifications were repaired and strengthened with towers and gates, and the inhabitants were also made freemen by royal charter. Strongbow being soon after invested with the sole government of Ireland, removed Robert Fitz-Bernard and his garrison to Normandy; and agreeably to the king's instructions, took upon himself the government of this city, as well as that of Dublin. In all the predatory expeditions which the English made into the territories of the natives, this city was always the centre of action in the south, the general rendezvous of the invaders, and the place in which all their spoils were deposited; but Strongbow having sustained a considerable defeat in Ossory, suddenly found himself shut up here in equal dread of an attack from without and of an insurrection within. From this distress, however, he was speedily relieved by Raymond le Gros, who arrived from England with a fleet of twenty ships, having on board twenty knights, 100 horsemen, and 300 archers and other infantry; and uniting his forces with those of Strongbow, they marched to Wexford, leaving Purcell governor of the city. But Purcell attempting to follow them in a boat on the Suir, was intercepted and slain by the Danish inhabitants, who also put to death all the English in the city, except a few who saved themselves in Reginald's tower, where they defended themselves with so much resolution and success that the insurgents yielded up the city to them on conditions little favourable to themselves. In 1177, soon after the arrival of Fitz-Andelm, as chief governor, in Ireland, an assembly of the Irish clergy was held in this city, in which the brief lately granted by Pope Alexander and the bull of Pope Adrian, granting to Hen. II. the sovereignty of Ireland (under the authority of which the first act of that monarch was the appointment of Augustine to the vacant bishopric of Waterford, whom he ordered to be consecrated by the Archbishop of Dublin), were solemnly promulgated, and the English sovereign's title to the dominion of Ireland was declared in form, with dreadful denunciations against any who should impeach the grant made by the Pope, or resist the sovereign authority of that monarch. In 1179, Robert le Poer, who was governor of Waterford, was associated with Hugh de Lacy in the government of the English settlements, and subsequently received a grant of the entire county of Waterford, with the reservation of the city and the cantred of the Ostmen.

Waterford, from its situation and importance, became the centre of communication with England, as well as one of the chief places of trade in the island; and during the same year, Robert Fitzstephen, Milo de Cogan, and Philip de Braos landed here with fresh forces from England. In the Easter of 1185, John, Earl of Morton, son of Hen. II., accompanied by Ralph Granville, Justiciary of England, and other distinguished persons, and attended with a retinue of 400 or 500 knights and about 4,000 men, disembarked at this port to take upon himself the office of Lord Chief Governor of Ireland, and was received with congratulation by the different native chiefs. The earliest coinage in Waterford, of which indubitable evidence remains, is that of John, while Lord of Ireland, of which remain several silver halfpence, weighing from 10 to 12½ grains, are still preserved. After his accession to the throne of England, John granted to the citizens, in 1204, a fair for nine days, and in 1206 a charter of incorporation, apparently in many respects little more than a recital and confirmation of privileges previously granted. In 1211, that monarch landed here on his way to Dublin to arrange the affairs of the Irish Government; and during his stay in the city, he ordered pence, halfpence, and farthings to be coined there, of the same standard as in England, to be equally current in both countries. In the early part of this century were founded nearly all the religious houses that anciently existed here, of which the Benedictine priory of St. John's was by King John, and the others by the inhabitants. In 1232, Hen. III. granted a new charter, in which the election of a mayor is first mentioned: the citizens, by this charter, were also empowered to choose a coroner, and to have a guildhall, a prison, and a common seal in two portions. In 1252, the city was burned to the ground; and in 1280 it was so much injured by a conflagration, that it was a long time before it recovered its former prosperity. In 1292, the custody of the castle and of the county at large was granted to the heirs of Thomas Fitz-Anthony, in the same manner as it had been enjoyed during Edward's minority by John Fitz-Thomas, and subsequently by his cousin, Thomas Fitz-Maurice, from whom it had been recovered at law. Edw. I. was the next sovereign after John that coined money here, and several of his pence and halfpence are still preserved.

On the 4th of September, 1368, the Poers of the county of Waterford having assembled all their forces, and being joined by O'Driscoll with his galleys and men, embarked with the intention of plundering the city. The mayor, informed of their design, prepared to resist them, and accompanied by the sheriff of the county, the master of the hospital of St. John of Jerusalem, and a number of merchant strangers and English, sailed towards the enemy in order to give them battle. A sanguinary conflict ensued, in which the Poers and O'Driscoll's were victorious; the mayor, sheriff, master of the hospital, 36 of the principal citizens, and 60 of the merchant strangers and English were killed; on the side of the enemy were killed the Baron of Don Isle, head of the Peers, together with his brother and many of his sept, besides a great number of the O'Driscoll's. In 1377, in consideration of the heavy burdens and charges the citizens had sustained in the repairs of the city and in its defence against the native Irish and other enemies, Edw. III. granted them the cocket customs of the port for ten years; at the same time enjoining them, as the city was exposed and defenceless towards the sea, to take care that it be firmly surrounded and provided, and that the quays be repaired and enclosed, so that it might be protected against various enemies who were preparing to attack it on that side. In consideration of the great expenses of the citizens in these fortifications, and in defending the city from the almost daily incursions of the Irish and of foreign enemies, Rd. II. granted them the customs and duties upon all goods and merchandise brought into it for sale. On the 2nd of October, 1394, that monarch landed at Waterford with an army of 4,000 men at arms and 30,000 archers, accompanied by the Duke of Gloucester, the Earls of Nottingham and Rutland, and several other distinguished noblemen, and remained here till the following Shrovetide; and in 1399 he again landed here and was joyfully received by the inhabitants; after spending six days in the city, he proceeded to Kilkenny. In

1413 the mayor and bailiffs, in prosecution of their feud with the Irish sept of O'Driscoll, embarked with an armed force in one of the ships belonging to the city, and sailed to the chieftain's strong castle of Baltimore, on the coast of Cork, where they arrived on the night of Christmas day. The mayor landed his men, and marching up to the castle gate, desired the porter to tell his lord that the mayor of Waterford was arrived in the haven with a vessel laden with wine, and would gladly come in to see him; upon the delivery of this message, the gate was opened, and the whole party instantly rushing in, O'Driscoll and all his family were made prisoners. In 1447, the city and the country were granted to John Talbot, Earl of Shrewsbury, created Earl of Waterford, with palatine authority; and in the same year also it was enacted by statute of the 25th of Hen. VI., that it should be lawful for the mayor and citizens of Waterford to assemble what forces they pleased, and to ride in warlike array, with banners displayed, against the Powers, Walshes, Grants, and Daltons, who had for a long time been traitors and rebels, and continually preyed upon the king's subjects of Waterford and parts adjacent. In 1460, O'Driscoll, continuing his hostilities, all communication between his country and this or any of the English ports was rigidly prohibited by act of parliament. This chieftain, on the invitation of the Powers, whose hostility continued without intermission, brought his forces by sea to Tramore, on the first intelligence of which the mayor and citizens marched out in battle array to Ballymacdane, where they met with the enemy and gave them a signal defeat; 160 of their number were killed, and several taken prisoners, among whom were O'Driscoll-Oge and six of his sons, who with three of his galleys were brought in triumph to Waterford. Edw. IV. was the last sovereign that coined money here; in the 15th of his reign, all the mints of Ireland were abolished except those of Waterford, Dublin, and Drogheda. In 1484, a shipment by some merchants of Waterford to Sluys, in Flanders, in preference to Calais, raised the important question of Ireland being bound by statutes made in England, which was finally decided in the affirmative.

In 1487, during the plot for raising Lambert Simnel to the throne, the citizens, while the insurrection in his favour was almost universal, maintained a firm and unshaken loyalty to Hen. VII. The Earl of Kildare, then Lord Deputy, having proclaimed him king in Dublin, sent to the mayor of Waterford, commanding him to receieve the pretender and assist him with all his forces; to which, with the advice of the council, he wrote in reply, by a messenger of his own, that the citizens of Waterford regarded all the supporters of Simnel as rebels, on the receipt of which answer, the Earl ordered the messenger to be hanged. He then sent his herald to command the mayor and citizens to acknowledge and proclaim the new king, on pain of being hanged at their doors; this message they received in the boat, without allowing the herald to land, and sent back word that they hoped to save the false king and his adherents the trouble of coming so far for such a purpose, by meeting him on the road. Preparations for battle were accordingly made, in which the Butlers and other septs then in the city, and men from several other towns, joined the mayor and citizens; but the departure of Simnel for England suspended farther proceedings; he, however, assembled a parliament previously to his embarkation, in which he declared the franchises and the possessions of the city forfeited. Hen. VII., to acknowledge the steady loyalty of the citizens, wrote a letter of thanks to them immediately after the battle of Stoke, and empowered them to seize the persons and appropriate the goods of as many of the insurgents as they could secure. Sir Richard Edgcombe, who, after these disturbances, was sent with a considerable force to receive new oaths of allegiance from the leading men in Ireland, arrived in this city from Kinsale in June, 1488, and was honourably entertained by the mayor and citizens, to whom he promised so to represent matters to the king that, in the event of the Earl of Kildare being again raised to authority, they should be secured from his resentment, by an exemption from his jurisdiction. In a parliament held in 1492, the citizens, who it was stated "had by false surmises been attained, by authority of parliament, in the time of Gerald, Earl of Kildare, Lord Deputy," were formally restored to the enjoyment of their grants, authorities, and privileges. In 1497, they again testified their fideltiy to the same sovereign, by communicating to the king intelligence of the arrival of Perkin Warbeck at Cork, on a second expedition against Ireland, and assuring him of their loyalty and affection: on this occasion, among other honours conferred upon the city, was the motto, "Urbs intacta manet Waterford." Perkin, being joined by the Earl of Desmond and his numerous followers, immediately marched with an army of 2,400 men to attack Waterford, which they assailed on the west; the siege lasted eleven days, during which time the citizens were victorious in several skirmishes. Eleven of the enemy's ships arrived at Passage during the siege, two of which landed their men at Lombard's weir; but they were quickly overpowered by the citizens, who killed many of them and carried several into the city as prisoners and beheaded them in the market-place; one of the vessels was sunk in the river by the cannon on Reginald's tower, and the whole of the crew perished. At length, on the 3rd of August, the enemy, before daybreak, raised the siege, and retired with great loss towards Ballycashin. Perkin embarked at Passage for England, but was pursued by the citizens with four of their ships to Cork, thence to Kinsale, and lastly to Cornwall. In acknowledgement of these distinguished services, the citizens received two letters from the king, in the first of which, previously to Perkin's apprehension, he offers them 1,000 marks to secure him. In 1535, Hen. VIII. wrote to the mayor and citizens by Wm. Wyse, a gentleman of the city in high favour at court, and conferred on him a gilt sword and a cap of liberty to be borne before the mayor, which are still carefully preserved. In 1547, Sir Edward Bellingham, who had been sent over by the Lord Protector and privy council of England, landed here with an army of 600 horse and 400 foot; and in 1549 the Lord-Deputy Sidney, who had encamped at Clonmel, and was apprehensive of being attacked by the insurgent chiefs, sent to the mayor for a few soldiers for three days; but the citizens pleading their privilege, refused him any assistance. In 1588, Duncannon was fortified, in consequence of an invasion of the Spaniards, who committed great depredations in the counties of Waterford and Wexford. In April, 1600, the Lord-Deputy came to Waterford, where he received the submission of some of the Fitzgeralds, of the Decies, and the Powers. On the accession of Jas. I., great disaffection prevailed in the city, and dangerous tumults arose at his proclamation. In consequence of these and of similar demonstrations of hostility, the Lord-Deputy Mountjoy made a progress into Munster, and arrived at Grace-Dieu, within the liberties of the city, on the 5th of May, 1603, and summoned the mayor to open the gates and admit him with his majesty's army into the city, to which the citizens replied that, by a charter of King John, they were exempt from having soldiers quartered upon them, and would admit only the Lord-Deputy himself. Two R. C. clergymen, in the habit of their order and bearing the cross erect, went into the deputy's camp to defend the conduct of the citizens; but the Lord-Deputy, threatening "to draw King James' sword and cut the charter of King John to pieces, destroy the city and strew it with salt," the citizens opened their gates to him and his army, and swore allegiance to the new monarch; after which, leaving a strong garrison to keep them in subjection, Mountjoy departed.

(To be Continued.)

THE BANKS OF THE BRONX.

I know a beautiful garden
Untouched by sickle or shears,
Where year after year the treasure
Of the golden-rod appears.
There the blue of the aster tosses,
The fire of the sumach glows,
And the gentian's delicate petals
Fearless of frost unclose.

The wind is the only gardener,
He sows the silken seeds,
And after his work is over
Plays on a harp of reeds
Tunes of the woods and waters,
Chansonnettes of the dew,
And songs of the cloud and starlight
Old when the world was new.

At Messrs. Stevens' auction rooms, the library of 112 vols., which "went round the Empire" with the Prince and Princess of Wales, some having the signature of the Prince, was bid up to £20, but remained unsold; but a set of ten jade slabs, 11½in. by 5in., carved and written by Chia Lung in 1826, found a purchaser in Mr. Yates Thomson at £200.

THE HISTORY AND ANTIQUITIES OF THE CITY OF DUBLIN.

FROM THE EARLIEST ACCOUNTS:

Compiled from Authentick Memoirs, Offices of Record, Manufcript Collections, and other Unexceptionable Vouchers,

By THE LATE WALTER HARRIS, ESQ. WITH AN APPENDIX.

Chapter V.

Of the growth and Increase of the City of Dublin without the Walls.

Sect. I.

Whoever takes the pains of comparing the two maps annexed to this work, namely, one published by Mr. Speed in 1610, and the other by John Rocque in 1759, will readily perceive the great growth and increase of the city of Dublin without the walls since the former of these periods. At that time the river Liffey was not embanked by quays on the north side, and only a part of it on the south. The ground now called the Bachelor's walk, the two Ormond quays east and west of Essex bridge, the Inns quay, Arran quay, and Back quay, taking up in the whole an extent of ground of above 5,000 feet, on which are many commodious and some stately houses erected, was then covered with ouse, and overflowed by the tides, except a small part about the King's-inns, which had been a monastery of Dominican friars. Mary's abbey was then the extent of that part of the town (called Ostmantown, corruptly Oxmantown) to the east, and north-east from thence to the shipbuildings, containing Capel street, Abbey street, Mary's street, Jervis street, Stafford street, Henry street, Great Marlborough street, Henrietta street, Bolton street, Dominick street, Dorset street, Drogheda street, Cavendish street, and Sackville street. This last-mentioned street requires a larger description than this place will admit of, which for elegance of plan and architecture exceeds any street in London. These, with a great number of other streets and lanes, have been since laid out in that quarter. On the other side, to the west, Michan's church and Church street (so called from thence) were for the most part the bounds, and all westward of them, as far as the Barracks and Montpelier hill, taking in Bow street, Smithfield, Hay-market, Channel row, King street, Queen street, Linen-hall street, Anne street, Lurgan street, Coleraine street, and many other streets and lanes have increased on this side. Grangegorman, Stonybatter, and Glasnemenoge, now united to the town, were then villages at some distance from it, in the latter of which places the sheriffs have been known to hold their courts in the times of the plague, and particularly in the year 1575 (Lib. Alb. Eccl. S. Trin. Dub. MS.), as being remote from the city.

On the south side of the Liffey the city hath been likewise much enlarged since the year 1610. The space of ground now occupied by Crane lane, Essex street, the Custom-house, Sycamore alley, Temple bar, Fleet street, Aston's quay, and Lazer's hill was then under the dominion of the water, and George's quay, with a large tract of many acres (now good meadow ground), from the lower end of Lazer's hill to Ringsend bridge has in our memory been recovered from that element. Dame street contained then only a short range of buildings on the north side, and extended no farther than to the precincts of the Augustin monastery, not three hundred feet in length, opposite to the end of George's lane. The dissolution of that religious house made room for enlarging the city eastward, the precincts whereof were first converted into gentlemen's houses and gardens, such as the Lord Chancellor Eustace's, John Crow's, and others, which were again demoilshed in our memory, and converted into several streets, as Eustace street, Crow street, at the end of which near Temple bar has lately been erected the new theatre-royal on the place where the said monastery formerly stood, Fownes's street, and others. The parts opposite to the then Dame street were principally taken up by St. Andrew's church, and church-yard, which at that time stood very near to Dame's gate, and on a part of the site of that church and church-yard Castle lane and the houses adjoining were laid out, and on the remainder the Castle market was built by alderman William Fownes and Thomas Pooley, Esq.; so lately as the year 1704. The church of St. Andrew was before that time removed further eastward near the college, where it now stands. George's lane was nearly the extent of the suburbs to the east, and was then but slenderly built, and thinly inhabited; though we are told by Mr. Stanihurst (Description of Ireland in Holingshed, p. 23) "that it was anciently a place of more consequence, but that the inhabitants thereof, being daily and hourly molested and preyed on by their prolling mountain neighbours, were forced to suffer their buildings to fall into decay, and to embay themselves within the city walls." The same writer adds, "that a place therein (called at the time of his giving that account in 1586), Collet's-inns, was in ancient times the seat of the king's exchequer, but that once the baron sitting in it solemnly and carelessly, the Irish laid hold of the opportunity, rushed in, surprised the unarmed multitude, slew all that fell under their power, and ransacked the king's treasure; after which mishap the exchequer was removed from thence into a place of greater security." That author gives no account when this accident happened; but it appears from records that the site of the old exchequer was on the 28th of July 36 Edw. III (1362) granted in custodium to the prior and friars of the Augustinian order in Dublin (which lay in the neighbourhood of it), for the profits whereof they accounted in the 17th year of Richard II. (1393), as appears by a pipe roll of that year in Birmingham tower. The place, nevertheless, though abandoned as to its original use, retained the name of the exchequer long after, which it communicated to a lane called Chequer lane, built in the year 1610, and extending from George's lane to Grafton street. Stanihurst proceeds (Description of Ireland in Holingshed, p. 23), "That there was in that lane (namely, George's lane) a chappell dedicated to St. George, likely to have been founded by some worthy knight of the garter; that the mayor, with his brethren, was accustomed with great triumphs, and pageants yearlie on St. George's feast to repair to that chappell, and there to offer; but that the chappell had beene of late razed, and the stones thereof, by consent of the assemblie, turned to a common oven; converting the antient monument of a doutie, adventurous, and holie knight, to the coal-rake sweeping of a puf-loafe baker." This chapel was under the care and government of a master and wardens, and supported chiefly by oblations; for which reason the parliament thought proper to take it under their protection, and by a statute (Rot. Cancel. 36 Hen. VI. No. 19) provided, "That whatever person in the county of Dublin should make any prey upon the Irish enemies, exceeding forty cows, should deliver one cow, or five shillings in money, towards the reparation of St. George's chappell in Dublin, and an action was given for the recovery of the same to the master and wardens thereof."

A village, called Hogges, lay without side the city walls, and eastward of George's lane, in which a nunnery under the invocation of the B. V. Mary was founded by Dermod Mac-Murrough, king of Leinster, about the year 1146, before the arrival of the English in this kingdom. It is not improbable that the village took its rise as well as its name from the nunnery: For Ogh in the Irish language signifies a "virgin"; and, removing the aspirate, H, the word by an easy corruption may pass into Hogges, as much as to say the place of the virgins. Be this as it may, the village is mentioned in several early charters, particularly in one made about the year 1200 by Sir Jeffery de Constantin to the abbey of Tristernagh (Archives of Tristernagh, MS. chart I.) in the county of Westmeath, whereby he grants to the said abbey one messuage without the walls of Dublin, near the village of Hogges, the footsteps or traces of the name whereof still remain in a street called Hogg hill; and Hoggin green, whereon St. Andrew's church now stands, which took up a large space of ground extending to the river Liffey, is often mentioned by the Irish historians as the common place for

the execution of criminals, among whom, to give one instance, Adam Duff O-Toole was in the year 1327 burned here for heresy and blasphemy (Campion's Hist. of Irel. p. 86. Chron. in Holingsh. p. 69). Part of this green is now called College green, from a college founded there by queen Elizabeth in the latter end of the 16th century, on the site of the monastery of All-saints. This village is now united to the city, and the whole green taken up by buildings; though at the period mentioned scarce anything but that little village, the sites of the said religious houses, a Bridewell for the reception of vagrants, and an hospital, where the parliament house now stands, were to be seen. A place also on this green was anciently called Hoggen-butt, where the citizens had butts for their exercise in archery; and near them was a small range of buildings called Tib and Tom, where possibly the citizens amused themselves at leisure times by playing at keals or nine-pins. This practice seems to be hinted at by an old proverb, though not applied to this place, namely, "he struck at Tib and down fell Tom." We find these buildings called Tib and Tom, mentioned in the will (Prerog Office) of Richard the first earl of Cork, as mortgaged to him by Theodore lord Dockwra, and the lady Anne his mother, for three hundred pounds, and rented from the mortgagee by Sir Philip Percival at twenty-four pounds per annum.

On the east and south of George's lane (the churches of St. Peter and St. Stephen, and the college excepted) little was to be seen but enclosed fields. Stephen's green was then so called, which took its name from the neighbourhood of the church of St. Stephen, and no improvements were on it; nor was there any open street or passage from thence to the college, but round through George's lane. A part of Keivan's street was indeed then built, and some residentiary houses of the prebendaries and canons of the cathedral of St. Patrick, together with the archbishop's palace. From hence the reader will have a just idea of the growth and increase of the city in these quarters, when he sees that Chequer lane, William street, Clarendon street, King street, Grafton street, Anne street, Duke street, Dawson street, Molesworth street, Kildare street, Frederick street, Merrion street, Leinster street, Nassau street, Clare street, the buildings about Stephen's green (which is one of the finest squares in Europe), being almost an English mile in circumference, York street, Aungier street, Peter street, Cuffe street, with many other streets and lanes, have been added to it since the period aforementioned. The same thoughts will occur when he views the west and south-west parts of the town, and sees what few streets or buildings then extended westward or southward of Newgate, except Francis street, James's street, and Thomas street, and the precincts of churches and religious houses.

Sect. II.

Besides the growth of the city and suburbs in streets, lanes, and alleys, since the time mentioned, it hath also been wonderfully improved in buildings both public and private.

Within the walls of the city, the castle hath indeed lost its ancient strength, but hath assumed a more graceful form, and better fitted for the settled times of peace and tranquillity. Within that compass is to be seen a stately tholsel, erected in the year 1683, and adapted to the business of commerce, wherein are chambers laid out for holding the general assemblies of the city, the quarter sessions, and other courts for the administration of justice, and where the records of the city both ancient and modern are preserved with great care. Near to the former was erected in the year 1695 a commodious building called the Four-courts for the despatch of the public justice of the nation.

What alterations the city has received in respect to private buildings has been seen before, and there are in it several stately houses, most of the principal streets are well built and very little inferior to those in London, and the houses are well adapted to the uses of trade and of the several families inhabiting in them.

The public buildings without the walls of the city are, the Royal Hospital of Kilmainham, a large and elegant building, erected in the year 1684 for the reception of aged and maimed soldiers; its form is quadrangular, finely seated on a rising ground at the west end of the town near the river Liffey. The Blue-coat-boys Hospital in Oxmantown for the maintenance and education of decayed citizens' children, situate at the west end of the city near the barracks, built in the year 1670. Stephen's Hospital, a fair, large, and commodious building, for the maintenance and cure of the sick and wounded, at the west end of the city, on the side of the river Liffey. Mercer's Hospital in Stephen street, and the Charitable Infirmary on the Inns quay for the same purposes. An hospital for incurables on Lazer's hill. The Poor-house. Lying-in Hospital. An hospital for lunatics. The Barracks, the largest and handsomest building of the kind in Europe, in which are generally quartered four battalions of foot and one regiment of horse; most pleasantly situated at the west end of the town, and on the north side of the river, having an agreeable prospect of the water, the fields, the city and the neighbouring mountains. Add to these a stately Custom-house, five bridges, of which Essex bridge a most stately and masterly performance, newly re-built according to the model of that at Westminster, with balustrades of stone and foot passages on five arches of most curious workmanship, and a large and elegant house for the habitation of the lord mayor for the time being, but these will be handled more at large hereafter. The two cathedrals and the college will be taken notice of in separate chapters, and the parliament-house not passed over in silence.

The stately houses of the nobility and gentry are too numerous to be described; and therefore we shall content ourselves with naming the few following. About Stephen's green are Abercorn-house, now inhabited by Lord Joscelyn, the Earl of Lanesborough's, the Earl of Shelburne's, Mr. Whaley's, and the late Bishop of Clogher's. In other parts of the town, the Earl of Tyrone's, Lady Alice Hume's, Mr. Trevor's, Mr. Putland's, the Earl of Charlemont's, the houses in Sackville street, Cavendish street, Dominick street, Kildare street, Dawson street, Molesworth street, and many other streets which are improving in elegance of buildings, which are not exceeded by any other cities in Europe. But, above all, a house built by the Marquis of Kildare, perhaps the noblest city residence in the British dominions.

From its present state may be fairly inferred that the character of "Nobilissima Civitas" given to Dublin by King Edgar's charter in the 10th century, is now truly applicable to it. It is about ten miles in compass, the second city in his Majesty's dominions, and the fifth, perhaps the fourth, in Europe.

(To be Continued.)

THE FUTURE.

Through the gray cloisters of our silent fears,
One with our requiem of tears,
One with our chant of bitter loss—
Recessional of grief from shadowed cross—
There comes the beat of vast, incarnate chords,
Like steel on steel, and swords on swords;
Deep thrilling harmonies of prayer arise
To sound across the plains of Paradise.
Impregnate life leaps in our souls again,
Here, by the wide abyss of pain,
Our nation's cry is swept along
Within the Prophet, Saint, and Martyr song.

TARA'S HALL.

(From the "Dublin Penny Journal," 1832.)

In the library of Trinity College, Dublin, there is preserved the fragment of an ancient Irish MS., which contains a description of the Banqueting Hall of Tamar or Tara, which is very curious. It states "That the palace of Tamar was formerly the seat of Con, of the hundred battles; it was the seat of Art, and of Cairbre Liffeachar, and of Cathor Mor, and of every king who ruled in Tamar, to the time of Niall.

"In the reign of Cormac, the palace of Tamar was nine hundred feet square; the diameter of the surrounding rath, seven diu, or casts of a dart; it contained one hundred and fifty apartments, one hundred and fifty dormitories, or sleeping rooms for guards, and sixty men in each; the height was twenty-seven cubits; there were one hundred and fifty common drinking horns, twelve porches, twelve doors, and one thousand guests daily, besides princes, orators, and men of science, engravers of gold and silver, carvers, modellers, and nobles.

The eating hall had "twelve stalls, or divisions, in each wing, tables and passages round them; sixteen attendants on each side, eight to the astrologers, historians, and secretaries, in the rere of the hall, and two to each table at the door; one hundred guests in all; two oxen, two sheep, and two hogs, at each meal divided equally to each side."

The quantities of meat and butter that were daily consumed here, surpasses all description; there were twenty-seven kitchens, and nine cisterns for washing hands and feet, a ceremony not dispensed with from the highest to the lowest.

LITERARY NOTES.

Lives of Napoleon flow in a steady stream from the publishers' offices. Recently we had Mr. J. H. Rose's exhaustive and authoritative biography, published at 18s, and now yet another life is announced, this time at the more modest price of 3s 6d, from the versatile pen of Major Arthur Griffiths. A Napoleon bibliography, which should include French as well as English and American publications, would make a bulky volume.

✧ ✧ ✧

The publishers' promises for the coming month are neither numerous nor important, and it is becoming more and more apparent that fear of the Coronation season will cause the book trade to be slack till the autumn. The consequence is that authors are finding their books more than usually difficult to dispose of, most houses having their lists full for the remainder of the year, and many books having been acquired that will not see the light till the spring of 1903.

✧ ✧ ✧

A great deal of new material is to be included in the collected edition of John Ruskin's writings. This is quite apart from the diaries he kept, which will, no doubt, eventually be published in full. Those who intend to subscribe to the collected Ruskin will be interested to hear that the price is definitely fixed at a guinea net the volume. At the moment it is difficult to say exactly how many volumes there will be, but not less than thirty and not more than thirty-two.

✧ ✧ ✧

In a bundle of secondhand theological tracts sent to the library of Trinity College, within the University of Melbourne, was found a first edition of the famous sermon preached in St. Paul's Cathedral before the Lord Mayor of London by Dr. Sacheverell on the "Perils of False Brethren in Church and State." It was ordered to be burnt by the common hangman. The copy that in some strange way had crossed the ocean from London to Melbourne was charred as if it had been in the fire, and had somehow escaped destruction.

✧ ✧ ✧

The original manuscript of Thomas Hood's "Song of the Shirt" was lately sold in Boston, U.S.A., for one hundred dollars. It was an item in the effects of a very old lady in the city, who, while in London at the time the ever-green effusion was published, begged the MS. from Mark Lemon, the then editor of "Punch," in which periodical the poem was first published. The lines are written on a sheet of ordinary commercial foolscap, which is headed "Dr.," "Cr."

✧ ✧ ✧

A number of Sheridan lots were recently disposed of in London. They included editions of the "Critic," "The Duenna," "Pizarro," and "The School for Scandal.' Offered first, at a reserve, in one lot, they were afterwards sold separately for a total of £13 17s. 6d. An old red Morrocco binding, protecting Taylor's "Antiquitates Christianæ," 1675, whose elaborate tooling is attributed to Elliot and Chapman, fetched £51; the Edinburgh edition of Stevenson, 30 vols., issued at £18 7s. 6d., £34; the Meredith edition de luxe, 32 vols., published at 16gns., £11 15s.

✧ ✧ ✧

Mr. E. V. Lucas has made good progress with the edition of Charles Lamb's complete works which he is editing for Messrs. Methuen. It will be in seven volumes, and these will be issued at the always popular price of six shillings. They are to have many illustrations referring to Charles Lamb and to Mary Lamb, for her writings are also included in the edition. It will be found to contain a large quantity of new prose and verse. Mr. Lucas has attempted in the notes not only to relate Lamb's writings to his life, but to account for all his quotations and allusions—surely a high ideal of thoroughness.

✧ ✧ ✧

From a correspondent whose name carries the weight of musicianly authority, we learn (remarks an English contemporary) that "The Kerry Dance," which was welcomed back to the piano organs the other day, does not owe its revival entirely to the memory of the mechanical music-maker. It has found its way to the heart of Ireland, and takes its place with the songs of Moore and Samuel Lover in the repertory of Irish ballad singers. It was sung at Queen's Hall on St. Patrick's Eve, and has been listened to with approval by the Irish Literary Society. This is pleasant to hear; for Molloy's melody is worthy of the great age of ballads.

✧ ✧ ✧

There have been several notable finds in Melbourne secondhand bookshops during recent years. Perhaps the most interesting was a manuscript book of Keats, containing the first drafts of several of his best-known poems. It became the property of the poet's brother, George Keats, and was brought to Australia via America. The late Professor Morris, of the Melbourne University, who died in London at the beginning of this year, found in a second-hand shop the first log-book kept by Captain Cook, covering a period of the great navigator's career that his biographers have regarded as a blank. It is to be published in the Professor's posthumous life of Cook now in the press.

✧ ✧ ✧

Thursday, the 10th inst, was the birthday of a notable literary man—General Lew Wallace, the author of the famous novel, "Ben Hur," which, as a drama, is now running at Drury Lane Theatre. General Wallace has spent all his life writing and fighting. His first novel was written when he was sixteen, and it was entitled, "The Man at Arms: a Tale of the Tenth Century." It was never published, but it amused many of the young friends of the equally young author. It was in 1874 that the General started on "Ben Hur," and after five years' reading and meditation he concluded his task. President Garfield read the book, and appointed the General Minister at Constantinople.

✧ ✧ ✧

In honour of the 338 aniversary of Shakespeare's birth, a commemoration festival was begun on the 14th April at the peaceful little town with which his great name will be ever associated. The celebration extends over three weeks. During the present festival no less than nine of Shakespeare's great plays are being produced, including, for the first time in the Memorial Theatre, an elaborate production of "King Henry VIII.," for which Miss Ellen Terry has very generously given her services. With the production of "Henry VIII." no less than thirty-two of the master poet's plays have been performed on the Memorial stage since the erection of the theatre twenty-three years ago, and they have included several that has not been played since Shakespeare's time, and others at rare intervals.

✧ ✧ ✧

Editiones principes of Shelley formed a feature of the last day's sale of the Hibbert library. The extremely rare Pisa edition, 1821, of "Adonais," "With the Compts. of the Author to Sir Charles Hyde, Bart.," 9¾in. by 6¾in., realised £270 (rebound, it was valued at £12 a few years ago); "Alastor," 1816, £38; "Prometheus Unbound," "H. Smith, Esq., from the Author," £20 5s.; "The Cenci," Horace Smith, Esq., from the Author," £39; "Zastrozzi," 1810, £150; and "Queen Mab," 1813, £60. All were in calf extra, by Bedford. Sherstone's "Poems upon Various Occasions," 1737, with an 82-line poem in his autograph, made £71; Voltaire's "La Pucelle," 1789, £39 10s.; Walpole's "Castle of Otranto," 1790, one of six copies in vellum, £190; George Wither's "Collection of Emblemes," 1685, £25.

✧ ✧ ✧

Why study a great poet at all after the manner of the dissecting-room? Why not rather seek to make the acquaintance of his living soul, and to feel its power?" That is the burden (remarks the "Academy") of a refreshing article on "Literary Values" which Mr. John Burroughs, that graceful American essayist, contributes to the "Century Magazine." "Young men and young women actually go to college to take a course in Shakespeare, or Chaucer, or Dante, or the Arthurian legends. The course becomes a mere knowledge course. My own first acquaintance with Milton was through an exercise in grammar. We parsed "Paradise Lost." Much of the current college study of Shakespeare is little better than parsing him. The class falls upon the text like hens upon a bone in winter; no meaning of word or phrase escapes them, every line is literally picked to pieces; but of the poet himself, of that which makes him what he is, how much do they get? Very little, I fear. They have had an intellectual exercise, and not an emotional experience. They have added to their knowledge, but have not taken a step in culture." Mr. Burroughs is great on the appreciation of single lines, like Wordsworth's

The last to parley with the setting sun;

or Whitman's

Oh! waves, I have fingered every shore with you;

or Emerson's

The day, immesurably long, sleeps over the wide, warm fields.

✧ ✧ ✧

"With the Wild Geese," Miss Emily Lawless's new volume of poems, has been excellently received by the critics. The poems, the "Academy" remarks, have a soul in them, and the diction is natural and unsought, and free from strivings after effect. Above all the poems breathe the passion and the air of Ireland; they are full, not of the artificial thing called "local colour," but that true colour which passes into the blood, and is bred in with nationality alone. The first section, "With the Wild Geese," takes its title from the expatriated Irish who fled abroad to take foreign service after the defeat of the allied French and Irish by William's Dutch general, Ginkle, at the battle of Aughrim. Their countrymen, with unfailing instinct of poetic speech, gave them the name of the feathered emigrants which they so often watched flying across the Atlantic, the wild geese. The regrets, the heart-break, the bravery, the home-sickness of these wild geese are sung in poems of varying metre, but with the uniform grey note of sadness and hopefulness. Miss Lawless has identified herself with their feelings in vividly dramatic fashion. Too long, mostly, to be quoted entire, single stanzas would convey no idea of the dramatic quality which resides in the whole. One poem, indeed, is brief enough for citation:—

Heart of my heart, I sicken to be with you,
Heart of my heart, my only love and care;
Little I'd reck if ill or well you used me,
Heart of my heart, if I were only there.

Heart of my heart, I faint, I pine to see you;
Christ! how I hate this alien sea and shore!
Gaily this night I'd sell my soul to see you,
Heart of my heart—whom I shall see no more.

It is hardly representative, and one thinks of a few Jacobite lines:—

He gave his bridle-reins a shake,
Said, "Adieu for evermore,
My love!
And adieu for evermore!"

which reach at once a more intimate poetry.

SCIENTIFIC TOPICS.

It is said that Prof. Haeckel has consented to sit for a statue to Prof. Harrow Magnussen. The statue will probably be placed in the Zoological Gardens at Jena. One of Prof. Haekel's friends some years ago gave 15,000 marks for this purpose.

✧✧✧

An ingenious chemist has made the claim that the average human being is worth £3,560 from the chemical standpoint. His calculations are based on the fact that the human body contains three pounds and thirteen ounces of calcium; and calcium, just now, is worth £59 an ounce.

✧✧✧

Prof. Charles Wilson has announced to the Royal Society a new determination of the temperature of the sun. His figures are 6,200 deg. C. (11,192 deg. F.). It is stated that the absorption of the sun's atmosphere probably makes this temperature equivalent to 6,600 deg. C. at the surface.

✧✧✧

A process has been introdûced in France for making briquettes of garbage. The refuse of the abattoirs, fish markets, etc., straw, paper, and the like is cut fine and mixed with tar and naphtha. The mass after being kneaded is dried and pressed into briquettes, which it is claimed will burn brightly, giving off a slight odour of gas, and engender heat slowly.

✧✧✧

The "Entomologist" describes a peculiar instrument by means of which the silk-producing moths of the Australian genus Antheræ cut their way out of their hard cocoons. The instrument "is a short, hard, black, and curved thorn, situated in the thick joints at the base of the forewings, one on each side. In a rubbed specimen the thorn is easily discernible; but in a good one it is concealed among the dense scales."

✧✧✧

Tests made of aluminium bronze at the Zurich Polytechnic shows that the specific gravity rises and falls as the percentage of aluminium is increased or decreased. For soft alloys the maximum strength was obtained with three and four-tenths per cent. of aluminium. The addition of silicon increased the specific gravity, but reduced the elas ticity. Iron added was not observed to alter the characteristics of the alloy in any great degree.

✧✧✧

Dr. J. H. T. Stempel, of New York, who has lived in Manila for a considerable period of time during Spanish rule, has prepared the first Tagalog grammar and a complete English-Tagalog and Tagalog-English dictionary. The manuscript is about ready for the press. Dr. Stempel has embodied in his work not only the Malayan roots of the various Philippine dialects, but also Spanish derivatives that have been adopted by the natives during the Spanish rule of three centuries.

✧✧✧

Near the River Ebrosowka, eastern Siberia, Dr. Herz states that he discovered a huge mammoth preserved in the ice. The animal had assumed a reclining position, with its feet peculiarly bent beneath its body. Dr. Herz inferred that it had fallen down a declivity, and had been instantly killed. Grass was found in the mouth of the animal and food in its stomach. Two thousand years elapsed since that last mouthful of grass was torn from the sod. The animal was covered with a coat of rather thick, red-brown hair.

✧✧✧

Some interesting experiments in connection with the existence and nature of the microbes inhabiting the upper strata of the atmosphere, have been conducted by Dr. W. F. Hutchinson, of Cambridge, England, by means of a balloon. He took with him eight samples of glycerinated gelatine, which had been specially prepared. With these he secured specimens of the bacilli in the atmosphere over London, and these are now in course of cultivation and examination at his laboratory at Cambridge.

✧✧✧

Very large installations of a water purifying and softening system, known as the Desrumaux, are now being made on the Continent and in England, which system is said to involve the use of lime only. A railway installation aggregates one million gallons daily, or enough for a good-sized city, and is to be used for steam and household purposes as well. Water from rivers, canals, and commercial waterways of all kinds is rendered bright, clear, and potable, and is so entirely free from foreign matter in suspension or in solution that it is found to be excellent for deep-water shipping.

✧✧✧

The longest voyage on record under liquid fuel was recently completed by the steamship Murex. The course lay from Singapore to London, via Capetown, and covered a distance of 11,830 miles. The total consumption of liquid fuel for all purposes was from seventeen to eighteen and one-half tons per day. Had coal been used instead the consumption would have been from twenty-four to twenty-five tons of Welsh, or with Japanese from thirty to thirty-two tons daily. Aside from actual saving in cost, one must consider the economy in labour and the increase in the available cargo-carrying capacity.

✧✧✧

The steamship Afridi, which dropped anchor in New York Harbour on March 23, brought with her a collection of rare animals for the New York Zoological Gardens. Among them is a three-year-old hairy-eared rhinoceros, one of the only four known to be in captivity; four bears, from Korea and Japan; nine monkeys of the red-faced Japanese breed; one fox, one raccoon, two silver badgers, one sand badger, one wild boar, two yellow martens one lynx, two civet cats, four salamanders, two peacocks, and six parrots. A valuable orang-outang, three gibbon monkeys and a leopard died on the voyage.

✧✧✧

Dr. Schubert, of the Egyptian Section of the Royal Museum, Berlin, claims to have discovered in the papyri recently added to the collection of the museum, several entirely unknown poems from the Fifth Book of Sappho. According to the German authority from which our information is obtained the manuscript dates from the sixth or seventh century, and is not in very good condition. The discoverer has been able to decipher two of the poems, one of which describes the poetess of Mytilene comforting a departing pupil. Another is addressed to a former pupil who had removed to Lydia. The poems are said to show new metrical combinations.

✧✧✧

While M. Santos-Dumont was inflating the balloon of his No. 6 airship at Monaco, he was commanded by the authorities to cease immediately the process of hydrogen making, on account of the extraordinary effect that the drainage of refuse acids and chemicals into the bay was having on the water, which had turned a brilliant orange, and which it was feared might have an injurious effect on residents near the sea front, besides poisoning the fish. Subsequent investigations of the curious phenomenon, however, proved that the refuse sulphates running from the Dumont gashouse into the sea had, on contact with the chloride of sodium or common salt of the ocean, precipitated enormous quantities of oxide of iron. This pure rust had dyed the waters and the shore a most brilliant orange carmine, but except for this no harm was done. Beyond acting as a tonic for the fish, the rust was absolutely innocuous, and the work of inflation was forthwith resumed.

✧✧✧

The researches of Fehling have established the fact that gum-arabic and its concentrated solutions are not fermentable. Emile de Meulemeester, of Brussels, Belgium, has found by numerous experiments that, by mixing powdered gum-arabic with butter in the requisite proportions for absorbing the water, the butter can be kept for a long period without becoming rancid. If a small quantity of salt be added, the butter will preserve its aroma. This method of procedure is objectionable because it requires too large a proportion of gum-arabic, and because the gum should be free from impurities. It is difficult to procure pure gum in large quantities, and its price would speedily become prohibitive if the consumption were large. In order to obviate these disadvantages M. de Meulemeester proceeds in the following manner—Raw gum-arabic is dissolved in water, and the solution filtered to remove the impurities. The filtered solution is then mixed with the butter and the excess of liquid contained in the mixture is finally extracted.

✧✧✧

Lebon's memorial was published in 1801, and bore the title "Thermo Lamps or Stoves, which Heat and Light Cheaply, and which generate Power, useful for all Machines." Lebon's invention was developed in England, and was first practically utilised there by an engineer named Murdoch, at the large factory of James Watt, the inventor of the steam engine. In 1802 the entire facade of this large building was illuminated by gas, in honour of the peace of Amiens. Shortly after this event a German named Winsor, who had translated Lebon's memorial into German, came to London, collaborated with Murdoch, and received from King George the exclusive privilege of lighting London by gas. On July 16, 1816, his privilege was confirmed by Parliament, and by 1823 England had adopted gas. After Winsor had assured himself of the success of gas illumination in England, he went to France in 1815, rented an establishment in the Passage des Panoramas, and in a short time had the whole Passage lit by gas, as well as the Palais Royal. After these successes, Winsor succeeded in founding a company, which was, however, by no means successful. Other companies soon followed, and in a short time gas became one of the most widely used illuminants.

✧✧✧

The first investigator who laid claim to the discovery of illuminating gas was Philippe Lebon. The idea of using carburetted hydrogen gas for illuminating purposes seems to have had its birth in Paris in 1786. But the laboratory experiments made in England and France up to the year 1799 yielded no practical results. In the year VIII. of the Republic (1799) Philippe Lebon, who at that time was well known for his improvements in steam engines, described an invention for the utilisation of inflammable gas as an illuminant. Lebon generated his carburetted hydrogen gas by distilling wood, obtaining as a by-product tar, wood alcohol, and all the other substances found in a retort after the destructive distillation of vegetable material. The first carburetted hydrogen apparatus was installed at Havre for the illumination of the lighthouse. In the same year Lebon took out a patent on his invention. He exhibited his apparatus at his house between 1799 and 1802. The odour of illuminating gas, when it first comes out of the retort, is by no means agreeable. French men, therefore, immediately condemned the new system of illumination. In order to overcome this objection, as well as others, and to make the invention of Lebon more practicable, it was necessary to wash the gas. Had Lebon not died in the midst of his labours, he would undoubtedly have devised a method of ridding the vapours of some of their impurities. His widow in the year X of the Republic received a patent on an improved process. She died soon after her husband.

GLIMPSES OF THE PAST.

From the Dublin Newspapers of 1793.

JULY 16.—Yesterday being Quarter-day of the Merchants, the hall was what is generally looked upon as a full one, 130 freemen being present.

The principal business of the day was to take into consideration the petitions of 33 Roman Catholic Merchants, praying admission into the Guild.—The first petition in the order being that of Edward Byrne, Esq., being read, Mr. Decluzeau moved that it should be granted on paying 40s. as a fine.

Sir Edward Newenham opposed it with or without a fine, and demande da ballot, which being seconded by Mr. Edward Druit, of the Custom House, the tellers reported:—

Against granting the freedom ...	67
For it	63

JULY 22.—Saturday the unfortunate Hayden, convicted at the last Commission for taking post bills out of letters, was executed at the front of the New Prison, pursuant to his sentence. The High Sheriff attended at eight o'clock in the morning, and the unhappy man was launched into eternity a quarter before nine, and thus disappointed the idle multitude, who generally assemble on these melancholy occasions, to the great detriment of themselves and loss to the community; and we sincerely hope that the example set by Mr. Sheriff Hutton on this occasion will be followed at future executions.

The early execution of Hayden on Saturday last was of the greatest convenience to the whole neighbourhood of the New Prison, as the inhabitants, upon all former like occasions, were generally annoyed by a multitude of idle dissolute vagabonds, who generally assembled in such numbers that they could neither get into or out of their houses, nor could any person have access to them, let their business be ever so urgent, for four or five hours; and we are authorised and requested, by a number of respected persons in the neighbourhood, to return the High Sheriffs their thanks for relieving them from this very great nuisance.

JULY 29.—Yesterday one John Moore, charged with breaking open and taking numbers out of the Irish lottery-wheel, was brought here from England, in custody of one of his Majesty's messengers, and lodged in jail.

On Wednesday night last, about the hour of twelve, a person, who has since proved to be a Mr. John O'Connor, an officer of revenue in the district of Castle-Townshend, was met in Meath street by a chandler of the name of Mathew O'Conor; he was in a very faint condition from loss of blood, and begged to be carried to his lodgings, which were some place in the neighbourhood of Wood street, but had not strength, nor were his intellects sufficiently collected to inform his conductor where, or in what manner, he had met with the ill-treatment of which he had such melancholy signs. He became speechless at the west end of Aungier street, and was with the utmost difficulty conveyed into the police-house adjacent to Peter's Church, where, shortly after his arrival, he expired. His head was found shockingly battered, with deep wounds on each temple, and one under the right eye; however, on trepanning his skull, no fracture was discovered, nor did any part of his body show marks of violence. There were found on him several papers, by which his name and occupation were traced, a bank bill, some silver, and a watch. From these latter circumstances it appears more than probable that he was not attacked with a view to commit a robbery; yet the violence and situation of the wounds and contusions he received render it equally improbable that his death was accidental, or proceeding entirely from intoxication. To solve this mystery, upon strict enquiry it was found, that he gained last term a tedious and complicated law suit, and conjecture is pretty obstinate in leaving his murder at the door of his opponents, or some emissaries from them. The coroner's inquest sat on the body, and brought in a verdict of wilful murder by some person or persons unknown.

AUGUST 17.—This morning the Lord Mayor and Sheriffs of the city of Dublin waited on the Earl of Moira, at Moira House, with the freedom of this city, which had been voted to his lordship some years since, and was ordered to be presented in the most honourable manner. His lordship received them with that politeness and affability which distinguish him. After presenting the freedom, the Lord Mayor and Sheriffs had the honour of breakfasting with his lordship.

AUGUST 20.—This day a most superb entertainment was given at Daly's new rooms, by the members of the general committee of Catholics of Ireland, to the Earl of Moira, Duke of Leinster, and several other distinguished characters.

At Carrickfergus Assizes an action was brought by a Mr. M'Gauhey against the Rev. Mr. M'Cleverty, who was rector of the parishes of Skerry and Ranavan, for the recovery of the sum of £120, being a penalty of £10 per month, for not residing within his parish for the space of twelve months; when—on hearing counsel on several points of law, this being a new and singular case, which attracted the attention of the country, after full examination of witnesses—the jury brought in a verdict for the plaintiff, with costs.

Counsel for the plaintiff—Messrs. Blackburne, Dobbs, and Campbell. Agent—Mr. M'Kinsty.

Counsel for the defendant—Messrs. Dunn, Saurin, and Hodgkinson. Agent—Mr. Gordon.

AUGUST 20.—The pensioners in future to be excluded from the Irish House of Commons by the late Bill:—Charles Tottenham, Esq., £600 a year, from the 1st of December, 1773; William Montgomery, Esq., £600 a year, the same date; Sir Skeffington Smyth, Bart., £500, from the 1st of February, 1774; Thomas Coghlan, Esq., £300 a year from the 7th of June, 1776; £350 a year from the 25th of November, 1783; and £200 a year from the 8th of August, 1789; Ponsonby Tottenham, Esq., £300 a year, from the 20th of December, 1780; Sir William Godfrey, Bart., £300 a year, from the 25th of November, 1785; Sir John Stuart Hamilton, Bart., £300 a year, from the 18th of August, 1786; Hon. John Massey, £400 a year, from the 10th of October, 1787; Sir Richard Johnston, £800 a year, from the 8th of August, 1789; Thomas Nesbit, Esq., £500 a year, from the 1st of August, 1791; Sir James May, Bart., £300 per annum, from the 18th of September, 1792; total pensions—£5,450. Placemen to be excluded—W. Penefather, Esq.; Hon Chichester Skeffington; Sir Hugh Hill, Bart.; Owen Wynne, Esq.; and Lieutenant-Colonel James Blaquiere.

At a post-assembly held at the Exhibition-house in William street, in consequence of notices having been served on the city tenants of Baldoyle, by the Rev Walter Blake Kirwan, rector of the united parishes of Howth and Baldoyle, requiring that the tythes be paid to him, it was determined to withstand the said claim as obselete and unfounded, the city lands there having been from time immemorial tythe free, and that notice of this determination should be in consequence given to the city tenants.

AUGUST 28.—Saturday last being election-day of cutlers, painter-stainers, and stationers, or guild of St. Luke, Mr. John Chambers, of Abbey street, was unanimously elected master, and Alderman Thorpe, and Mr. John Read, of Skinner's row, were also unanimously chosen wardens.

Extract of a Letter from Roscommon, dated August 23, 1793.

"Thursday last the Right Hon. Lord Chief Baron and the Right Hon. Prime Sergeant Fitzgerald, returned here from Ennis, to proceed on the adjourned Assizes, when several prisoners were tried for tendering unlawful oaths, and breaking open houses and taking arms, and only one against whom any evidence sufficiently strong to warrant conviction.

"Mr John M'Dermott was then arraigned on an indictment for burglariously and feloniously breaking and entering the house of Thomas Tennison, of Castle Tennison, Esq., and robbing the same; and on being called to plead thereto, his counsel tendered a plea in abatement to the following effect:—'That James Caulfield, of Donamon, Esq., one of the grand jurors, empanelled to try and enquire, etc., was not at the time of the caption of the indictment, nor at the time of being sworn on the grand jury, a freeholder of said county, either in his own right or in the right of any other person,' which plea being received, the Right Hon. the Attorney-General demurred thereto, ore tenens. The demurrer was argued with great abilities and ingenuity by the counsel for the Crown; but the arguments in support of the plea were backed too well by legal authorities to yield to the persevering efforts against it. The Court took time to consider upon it, and gave a decided opinion in favour of the plea, and quashed the indictment. As the bills found by the same grand jury were liable to be rendered abortive by similar pleas, the Attorney-General moved the Court to discharge the grand jury, and to have a new one sworn; but this was likewise resisted with equal success, so that all that has hitherto been done falls to the ground.

"Counsel for the Crown—Rt. Hon. Arthur Wolfe, Messrs. Stanley, Blosset, Kirwan, Burke, Darcy, Daly, Conroy, Whitestone, O'Donnell, Wynne, Harrison, Wetber, Crofton, Trench, Johnson, and Ormsby; agent—Mr. Kemmis.

"Counsel for the prisoner—Messrs. Geoghegan, M'Carthy, Boyde, M'Dermott; agent—Mr. John Kelly."

AUGUST 28.—Part of the south facade of Dublin Castle has been taken down on account of some alarming fissures having appeared in its walls; it was expected that no other than the east wing of this elegant building was in danger, but we hear that on approaching the foundation the whole structure is found at the base in such a state, from an original defect in the construction of it, that the whole must be taken down. The old tower, which serves as a kind of belfry to the Castle Chapel, it is said, is also condemned to demolition.

The Hon. and Rev. Mr. Agar, younger brother of Lord Viscount Clifden, who has been recently appointed rector of the new parish of St. George, on the north side of the river, created by an Act of the last session of Parliament, has lately read his assent and consent in St. Thomas's Church.

This was neccessarily done there, as no parish church is yet erected in this lately imparished district; and it is very uncertain when one will be built there, it depending on the voluntary contribution of the inhabitants.

The valuation, however, of the several houses in its circuit, for the ascertainment of the minister's money, has been made; a commission having issued from his Excellency the Lord Lieutenant and Council for the purpose.

VOL. I., No. 7.] DUBLIN: SATURDAY, MAY 17, 1902. [PRICE ONE PENNY.

THE CITY OF DERRY.

FROM A PICTURE OF SEVENTY YEARS AGO.

(From Lewis's "Topographical Dictionary of Ireland," 1837.)

DERRY, or Londonderry, a city and port in the parish of Templemore, and county of Londonderry (of which it is the chief town), was originally and is still popularly called Derry, from the Irish "Doire," which signifies literally "a place of oaks," but is likewise used to express "a thick wood." By the ancient Irish it was also designated "Doire-Calgaich," or Derry-Calgach, "the oak wood of Calgach;" and Adamnan, abbot of Iona in the 7th century, in the life of his predecessor, St. Columbkill, invariably calls it "Roboretum Calgagi. About the end of the 10th century, the name Derry-Calgach gave place to "Derry-Columbkill," from an abbey for canons regular of the order of St. Augustine founded here by that saint; but when the place grew into importance above every other Derry, the distinguishing epithet was rejected: the English prefix, "London," was imposed in 1613, on the incorporation of the Irish Society by charter of Jas I., and was for a long time retained by the colonists, but has likewise fallen into popular disuse. The city appears to be indebted for its origin to the abbey founded by St. Columbkill, according to the best authorities in 546, and said to have been the first of the religious houses instituted by that saint; but the exact period of its foundation and its early history are involved in much obscurity. In 783 and 812 the abbey and the town were destroyed by fire; at the latter period, according to the annals of Munster, the Danes heightened the horrors of the conflagration by a massacre of the clergy and students. The place must have been speedily restored, as, in 832, the Danes were driven with great slaughter from the siege of Derry by Niall Caille, King of Ireland, and Murchadh, Prince of Aileach. In 983, the shrine of St Columbkill was carried away by the Danes, by whom the place was also thrice devastated about the close of the 10th century: in 1095 the abbey was consumed by fire. In 1100, Murtagh O'Brien arrived with a large fleet of foreign vessels, and attacked Derry, but was defeated with great slaughter by the son of Mac Loughlin, prince of Aileach. Ardgar, prince of Aileach, was slain in an assault upon Derry in 1124; but on the 30th of March,

1135, the town with its churches was destroyed by fire, in revenge, as some state, of his death: it also sustained a similar calamity in 1149. In 1158, Flahertagh O'Brolchain, abbot of the Augustine monastery, was raised to the episcopacy and appointed supreme superintendent of all the abbeys under the rule of St. Columb, by a synodical decree of the Irish clergy assembled at Brigh-mac-Taidhg, in the north of Meath. O'Brolchain immediately commenced preparations for the erection of a new church on a larger scale; and in 1162 he removed more than 80 houses adjacent to the abbey church, and enclosed the abbey with a circular wall. In 1164, Temple More, or "the great church," was built, and the original abbey church was thenceforward distinguished as Duv Regles, or "the Black Church:" the new edifice was 240 feet long, and was one of the most splendid ecclesiastical structures erected in Ireland prior to the settlement of the Anglo-Normans; its site was near the Black Church, outside the present city wall, and is now chiefly occupied by the Roman Catholic chapel and cemetery; both edifices were entirely demolished by Sir Henry Docwra, governor of Derry, in 1600, and the materials used in the erection of the extensive works constructed at that period; but the belfry or round tower of the cathedral served till after the celebrated siege, and has given name to a lane called the Long Tower. A Cistercian nunnery was founded on the south side of the city in 1218, as recorded in the registry of the Honour of Richmond; but from the Annals of the Four Masters it appears that a religious establishment of this kind existed here prior to that period. In 1274 a Dominican abbey was founded on the north side of the city, of which even the site cannot now be accurately traced.

The municipal government is vested in a mayor, twelve aldermen, and twenty-four burgesses, assisted by a recorder, town-clerk, and chamberlain; and the inferior officers of the corporation are a sword-bearer, mace-bearer, four town-serjeants, two sheriffs' bailiffs, &c. The city returned two representatives to the Irish parliament till the Union.

THE VALLEY OF YOUTH.

Beyond the seven firs that fringe the world
Upon its western verge,
An unknown sea—the Sea of Out-Bound Sails—
Rolls affluent surge on surge
Below our land of dreams and long desire,
Where twilight meet and merge.

On one side of our valley towers the wall
Of unremembered Birth,
And opposite, cloud-blotted, stretch in space,
The kingdoms of the earth;
But we, poor margin-dwellers, hold in fee
A land of little worth.

Alien among us sits a white old man
Who drifted back alone
On the full tide, unoared, unpiloted,
From out the sunset blown,
Who knew the land, and greeted it again,
And blessed it for his own.

Hour-long he prates that all the spacious world,
Where kings walk to and fro',
Is naught to this high valley of the firs,
Drifted with blossom-snow—
Hour-long he prates, day-long we look and yearn—
He is too old to know!

ISEULT'S CHAPEL.

THE DUBLIN VILLAGE TOWER OF THE RENOWNED HEROINE AND IRISH PRINCESS

Mr Julian Moore contributed recently to the "Athenaeum" the following note:—

I had nearly left Dublin without hearing of what I think it would not be hard to show, were such task necessary or useful to achieve, is the one monument of serious literary interest it possesses. The lesser and more grateful effort of urging the good citizens to throw off the excessive deference they have so long and so unthinkingly paid to the makers of their local histories, in allowing a record which any city might be proud to possess to remain unknown, is all I shall attempt. It is even of much critical interest that all lovers of English literature should be aware that, according to an immemorial tradition existing in a little village some three miles from the modern city, a tower in its midst was built by "La beal Izod," the renowned heroine and Irish princess whom Dante, Malory, Tennyson, Arnold, Wagner, and Mr. Swinburne (to mention but a few amongst the greatest) have loved to honour.

If the tradition can be accepted—and I hope to show it is sustained by evidence that, though slight, is difficult to reject—such relic adds in an important degree to the testimony which has been adduced to prove that the story is native to these islands, and also not far from being an approximate record of real facts.

The tradition was known to the early nineteenth-century historians of Dublin, but owing to a lack of what was then called "documentary evidence"—that is, mention by some early historian, whether he had any direct knowledge of the matter he was cited to prove or not—the story was dismissed; though, strangely enough, they were seemingly aware of those other points in the case upon which far more reliance would be placed nowadays.

In taking this course, Dalton, Warburton, and the rest in no way exceeded the ordinary custom of the time. It will be remembered that when Rich published the tradition regarding the Birs Nimroud, it was ridiculed by Rennell and other leading archæologists, on the ground that the position differed from that assigned to the tower by Herodotus, Ctesias (!), and Strabo, only one of whom is known to have been to Babylon. Time has justified this tradition, and through other examples has proved that where not concerned with buried treasure, about which it must be admitted the peasant mind is apt to prove unduly imaginative and unreliable, the once ridiculed "vulgar tradition" may be regarded as forming good prima facie evidence, and, if corroborated in any independent manner, may generally be considered as well worthy of acceptance.

In this case corroborative testimony is found, first in the name of the village itself—Chapel-izod—in which it is difficult to see any other origin than chapel-of-Izod, as Iseult, Isolde, or Yseult is often called in the older manuscripts, and this, as the older Dublin historians admit, has been traced in State documents as far back as the fourteenth century. It also seems impossible to account on any basis of falsity for a phrase in old French being found so firmly planted among an Irish rural population. Even if we assume that in the fourteenth or fifteenth century, when the fame of the story was at its height, a desire was felt to attribute some existing tower to Iseult, such endeavour would necessarily have come from among the educated class. Yet no trace has been found of the methods being employed that were customary with the romancers of history at the time—altering of manuscripts and the like. Apart, indeed, from such action, or the long-sustained verbal assertion for which a literary relic would plainly not offer enough wordly incentive, the only other means by which a story of the kind could become deeply rooted, and so widely current as to give the district its name, is by that of assuming Iseult to have really lived; and when accounts of her adventures, or the admiration that was felt for her beauty, reached Ireland, those who had known her would like to speak of her by the highly complimentary term she was said to be known by, and the chapel become matter for keen and enduring local interest.

The tower itself, it will not be uninteresting to add, is square in shape, and about 45ft. high. Some years ago it was taken down to form a corner for a new church, an attempt being made at the same time to improve the old ivy. As, however, the skill available was not equal to the excellence of the intention, the ivy died. But circumstances are regrettable—the former, from an ideal point of view, perhaps the more, but not otherwise. In these days it seems certain that we cannot rely on local authorities to preserve our old buildings, so their being put to some modern use may well be regarded as the lesser of two evils. It is to be hoped, however, that no actual alteration will ever be made in the old structure. Ireland has but few buildings which, judged from a European standpoint, are of a first-class interest, and hence this record of a work that has always been regarded as one of the world's greatest tragedies, and has aroused deeper and wider interest than the creation of all Irish poets, painters, and musicians put together, should be regarded as a national heirloom, at least until the production of some evidence more damaging to its history than the unreasoned denunciations of mere compilers.

ACCOUNT OF A PESTILENCE THAT RAGED IN IRELAND IN 1348,

As given by John Clyn, a Franciscan friar, Kilkenny, in his Annals.

(From the "Dublin Penny Journal," 1832.)

"This year, and chiefly in the months of September and October, great numbers of bishops and prelates, ecclesiastical and religious, peers and others, and in general people of both sexes, flocked together by troops, in pilgrimage to the water of Inchmoling, insomuch that many thousands of souls might be seen there together for many days; some came on the score of devotion, but the greatest part for fear of the pestilence which raged at that time with great violence. It first broke out near Dublin and Drogheda, insomuch that in Dublin alone, from the beginning of August to Christmas, fourteen thousand souls perished. This pestilence had its first beginning, it is said, in the East, and passing through the Saracens and infidels, slew eight thousand legions of them. It seized the city of Avignon, where the Roman court then was, the January before it came among us, where the churches and cemeteries were not sufficient to receive the dead, and the Pope ordered a new cemetery to be consecrated for depositing the bodies of those who died of the pestilence, insomuch that from the month of May to the translation of St Thomas, fifty thousand bodies and upwards were buried in the same cemetery. This distemper prevailed in full force in Lent, for on the 9th day of March eight Dominican friars died. Scarce a single person died in one house, but it commonly swept away husband, wife, children, and servants, all together." The author seems to have died of this plague, and to have had a foresight of his approaching fate: for he closes his annals in 1348, thus: "But I," says he, "Friar John Clyn of the Franciscan Order, of the Convent of Kilkenny, have in this book written the memorable things happening in my time, of which I was either an eye-witness, or learned them from the relation of such as were worthy of credit, and that these notable actions might not perish by time, and vanish out of the memory of our successors, seeing the many evils that encompass us, and every symptom placed as it were as a malevolent influence expecting death among the dead until it comes, such things as I have heard delivered with veracity, and have strictly examined, I have reduced into writing; and lest the writing should perish with the writer, and the work fail with the workman, I leave behind me parchment for continuing it, if any man should have the good fortune to survive this calamity, or any one of the race of Erin should escape this pestilence, to continue what I have begun."

THE HISTORY AND ANTIQUITIES OF THE CITY OF DUBLIN.

FROM THE EARLIEST ACCOUNTS:

Compiled from Authentick Memoirs, Offices of Record, Manufcript Collections, and other Unexceptionable Vouchers,

By THE LATE WALTER HARRIS, ESQ. WITH AN APPENDIX.

Chapter VI.

Of the manner how the citizens of Dublin rode their franchise in antient and modern times.

We shall have little here to do but barely transcribe the several forms used by the citizens in riding their franchises at different periods, as the same have been transmitted to posterity, either by automatic records or ancient manuscripts, whose evidence is not to be controverted at this day: more especially as the reader will readily perceive by comparing each form, how little variance there has been therein from the beginning to the present times, except in the names of places, which yet are but few. It would indeed be a difficult task for the citizens to have at any time stretched their rights beyond the just limits within the city or suburbs, as they were surrounded on most parts by vigilant neighbours, namely, the ecclesiastics of Mary's abbey, Kilmainham, Thomas court, and St. Sepulchre's, or the liberties of the Archbishop of Dublin; who were upon all occasions ready to procure papal anathemas and censures against those who offended them in less momentous matters than the loss of their lands. Several of the instruments we shall have occasion to cite are written in Latin, but to show our fidelity, we shall transcribe them verbatim, and for the sake of the English reader translate them into our own language.

The earliest instrument that occurs is one of John, earl of Morton and lord of Ireland, dated at London the 14th day of May in the 3rd year of the reign of his brother, king Richard I. (A.D. 1192), which refers to a former charter of local franchises granted by king Henry II., now lost. The charter of king John is to be seen in the black book (f. 221) of the archbishops of Dublin, called Alan's Register, being collected by Archbishop Alan in the reign of Henry VIII., and as it containeth other liberties besides their metes and bounds, we shall here give only so much thereof as is pertinent to the subject in hand, reserving the remainder for another place.

The charter of John, lord of Ireland, concerning the bounds and franchises of the city of Dublin, and of the liberties granted thereto.

"John, lord of Ireland, earl of Morton, to all his subjects and friends, French, English, Irish, and Welch, present and to come, greeting. Know ye that I have given and granted, and by this my charter confirmed to my citizens of Dublin, as well those who inhabit without the walls, as to those who dwell within them, as far as the boundary of the town, that they may have their limits, as they were perambulated by the oaths of the honest men of the city itself, in pursuance of a precept sent to them by king Henry my father, namely, on the east and south sides of Dublin, by the pasture-grounds which lead as far as the port of St. Kelvin's church, and so along the road as far as Kylmerekargan, and from thence as they are divided from the lands of Donenobroogi as far as the Doder to the sea, namely to Clarade, close to the sea, and from Clarade as far as Ramynelan. And on the west side of Dublin from St. Patrick's church through the valley as far as Farnan-Clenegimethe, and from thence as they are divided from the lands of Kylmainam, and beyond the water of Kylmainam near Avenliffey, as far as the ford of Kilmastan, and beyond the water of Avenliffey towards the north by Cnocknogannoc, and from thence as far as the barns of the Holy Trinity, and from those barns to the gallows, and so as the division runs between Clonlic and Crynan as far as Tolecan, and afterwards to the church of St. Mary of Ostmanby. These things we have also granted to them that their tenures and land be secure, who have any granted to them in our charter, from thence without the walls as far as the before-mentioned limits; that the city may not dispose of those lands as of other lands, but that they observe the common customs of the city as other citizens do. But this, we declare, of those who have had our charter of certain lands, within the said limits, without the walls, before we had granted the aforesaid liberties and this charter."

It will be readily perceived that the foregoing form is very general, and drawn up according to the simplicity of those early times, from whence it would be a difficult task to trace the limits of the city liberties step by step, and more especially as by its breaking off at the church of St. Mary of Ostmanby, it leaves a good part of them unsurrounded. We shall, therefore, in some measure supply this defect from an inspeximus of an inquisition recited in the same book (Lib. Niger Arch Dub. p. 222), and taken in the reign of Richard the second, entitled, "De metis libertatum per novam inquisitionem." i.e., "Concerning the bounds of the franchises of the city by a new inquisition"; as follows, viz.:

"Richard, by the grace of God, king of England and France, and lord of Ireland, to all to whom these present letters shall come, greeting. We have viewed, &c. It has been shewn unto us on the part of the mayor and community of the city of Dublin, &c., and the jurors upon their oaths say, that the bounds of the city of Dublin are on the east part of Dublin and on the south part thereof, namely, the pasture leading to the port of St. Kevin, and so by the road as far as Kilmerecarigan, and from thence as they are divided from the lands of Donobrooge to the Doder, and from the Doder to the sea, namely, to Clarada near the sea, and from Clarada to Reymdan, and from the port of St. Kevin's church by the way northward to a stone cross, where the 'eastern market' antiently used to be kept towards the west, and from thence to a lane near St. Sepulchre's in the passage towards a barn as far as to a certain old lane closed up near to the commons of the vicars of St. Patrick's church, which extend to St. Patrick's street, and in the west part of Dublin, from St. Patrick's church through the middle of the valley to the pool of the house of St. Thomas the martyr, leaving the south gate of the monasteries of Whiteschan and Conelan (a) towards the north on the left hand, and exactly through the middle of the depth of all the said pool, and from the said pool through the middle of a meadow leading to a pasture called le Irendam to the cross of Kilmaynan by the bounds of the lands of Kilmaynan, and from the said cross along the bounds of the lands of Kilmaynan to a ford called Tyrell's-ford, and from that ford between the lands of the church of the Holy Trinity, Dublin, and the land of Kilmaynan unto the water of Amliffy, and from thence along the said water as far as the ford of Kilmayhane, and beyond the water of Amliffy towards the north by Enolneganmocke, passing into a meadow, which leads towards the west as far as the high way, passing from Dublin towards Carberagh, and from thence to the barns of the Holy Trinity, and from those barns along a trench called Rugh-ditch to the high way leading from Finglas to the city, leaving the said trench on the left hand towards the north, and from that high-way leading to the water of Glasteynock and so to a hill towards the north where the gallows antiently stood, and from thence through the middle of the water of Glasteynock to the high-way leading from the said city towards Santreff, and beyond that high-way as far as the trench of the land of Clonclyffe, and so along that trench to a green lying on the north side of the abbatial house of St. Mary, Dublin, and from thence between the green and the said trench to the middle of the high-

(a) Such monasteries as Witeschan and Conelan do not occur in any accounts to have lain within the liberties of the city of Dublin, and therefore it may be presumed they were either dissolved in early times, or united to other houses. Among the pleas of the crown in Birmingham-tower, an. 3 Edw. II (1309) Thomas Thonnyr was indicted for harbouring Adam the son of Robert de Cauntetun who burglariously robbed the Church of the friers de pœnitentia Jesu Christi of Dublin, and taking from them 40s. Perhaps this house de pœnitentia may be one of the monasteries here mentioned; at least we meet with no other account of it.

way leading from Ostmanton to Tulgin, through the middle of the road of the village of Ballybough, unto an antient path of an old mill, leaving the abbey and land of Lexinam on the right hand towards the south, and the trench and path on the left hand towards the north, and so along the water of Amliffy to the abbey of the blessed virgin Mary of Ostmanby, &c."

We shall now give the form of riding the franchises as the same was done on the 4th of September in the 4th year of Henry VII. (1488) (Thomas Meyler being then mayor, William English and Robert Boys, bailiffs), taken from the white book of Christ-church, Dublin (f.65).

They proceeded well horsed, armed, and in good array, taking their way out of Dame's-gate, turning on the left hand to the Strond, and from thence straight forward to the long stone of the Stayne" (which yet standeth on the west end of Lazer's hill), "leaving All-hallowes on the right hand, keeping the Liffey side, until they came unto the Ring's-end, and from thence they kept forward to Clare road, alias Cleer-rode, for the shipping (which is now Poolbegg), and from thence to Remelin (now called the Barr-foot), and so eastward upon the strand on the south side as far as a man might ride, and there cast a spear into the sea at low water, thereby to show the extent of the city franchises eastward. Then they rode backward till they came to Black-stone by east Myrion, and leaving Myrion on the right hand, thence rode on a meer westward, until they came to our Lady's well, and so continued their course till they came by the gate of Smoothi's court; then surrounded the green, and passing the fords of Donnybrook, they left the town and the church on the left hand, and so kept on in the high way until they came to Kilmackargan on the west of Donnybrook; and thence continuing their march by the high-way-side, until they arrived at St. Kelvin's gate, and from thence northward unto the lane wherein a cross of stone was then fixed; but the ditch of the lane being a strong fence, they broke their way through the high way by the east of St. Sepulchre's, and so leaving St. Sepulchre's and St. Patrick's-close on the left hand, until they came to an old lane, adjoining to the north side of the chancellor's orchard, or Huggar-place; and so passed through an orchard, which sometimes belonged to Thomas Swetickby, and also through the gardens until they came to the house of Anne Ahohone, on the north side, where John Arthur some time dwelled, making their way through the same into the street; through which they marched southward as far as William English his house, which they passed through, mounting over the roof of another house, and passing also through several gardens until they came to the Coomb, and from the Coomb gate they proceeded to Cow lane, and so forward to Carnaclogh-Imathe (which is now Dolphin's-barn), and thence returning backward left it on the right hand as you ride to the cross ditch in the lane leading from Dublin to Kilmainham, and so downward to Bow-bridge, passing under an arch of the same through the water of Cammock, unless for their more ease they sometimes rode through the prior of Christ-church his lands, which they left on the south, whence they rode over the water of Cammock westward, to the place whereunto the water of Liffey sometimes reached, and so forwards towards the west, leaving the tilling land of Kilmainham on the left hand, and part of the meadow on the right hand, where is the narrowest place of the meadow, there being there a ditch of small thorns by the tilling land, whence they rode northward through the water of Liffey as far as to the west end of Helen Hore's Meadow, called the ford of Killmahennock; for on the hill, that is now called the hill on the west end of Helen Hore's meadow, by the high-way, they made an halt, and there drew up together, and took counsel. On the north side of this place there was an arch said to be common, on the which the prior of Kilmainham received the rent. Some of them rode over the north side of the arch, and some over the south side, meeting together in Gibbets-slade, leaving Knocknecoack (so named in their charter, and now called Hennock-mack-nack) on the right hand; and so continued a straight course to the prior of Christ-church his lessowe on the north side of the gallows; and so through the lessowe, leaving part of the tilling land on the right hand, and so proceeded through a part of Sharp's park into the nigh-way, where they turned northward as far as to the prior of Christ-church his barn, and so over Russel's-park, until they came to Barnes-end, where the prior made a way for them into the same, and caused a ladder to be put up unto a window, wherein John Savage citizen, and Richard White, one of the mace-bearers to the mayor, were sent by him and his brethern to observe how the franchises went. They also put a man through the window by a ladder to the barn-floor, where there lay a stone, as a mark of distinction between the liberties of the city and the prior, and so they proceeded from that stone eastward, over the Old-kill, and so eastward through the orchard belonging to the church of the Holy Trinity, leaving the gardens of the green on the right hand, and the tilling land on the left; and so continued their course to the high-way which leadeth to Glassen-even; and so to the place where the gallows stood in old time betwixt the abbot of St. Mary's-abbey his lands on the east side, and the prior of Christ-church on the west, where the abbot of St. Mary's-abbey, and his convent met with them, and prayed them, that they would do them no wrong; they then replying, that they would do nothing, but even as their predecessors informed and taught them how they should ride the franchises.

"Thence they rode northward upon the marches to Glaskeynock, and so forth on the high-way which goeth to Dryshock, and leaving the stone well on the left-hand, they proceeded southward until they came into the high-way going to Ballyboght, and from the gate of Ballyboght they came to the water of Tulkan by the bridge of Ballyboght, there passing over the water, keeping by the water-side southward, as far as they might ride, until they came unto St. Mary's-abbey, leaving the abbey on the right hand. On the west of the abbey, on the water-side, there lyeth a stone, where the abbot and his monks met them again, where the abbot told them, that they should have ridden by the west of the abbey, and so forth to the sea: But the mayor and his brethern said 'nay!' for by our book when we did return back from the Tulkan, we should have rid to our lady church of Ostmanby. And so they departed, every man repairing homeward to his lodging. And thus the mayor and his brethren made an end of the riding their franchises the day and year aforesaid."

(To be Continued.)

BEACONS.

Across the lonely stretches of the night,
When clouds hang dense and heaven reveals no star,
From out the calm and quiet harbour-bar
There gleams upon the heart-sick sailor's sight
A signal, whispering of the homestead light.
It flashed out through fog and rain-mist far,
To tell him where his love and haven are,
When dreams of dread would crush him in their might.

So when I, weary of the long, long quest,
A mariner upon the sea of pain,
Sought lands of peace or isles of honeyed rest,
Shoreward I gazed from the wide midnight main,
And saw, amid the darkness and the rain,
The lovelight of your eyes—God knows how blest!

IRISH MEDICAL GRADUATES IN LONDON.

The Irish Medical Schools and Graduates' Association, with headquarters at 11 Chandos street, Cavendish square, London, is an organisation which seems to us to be worthy of the most active and whole-hearted support of all Irish medical men. The Association is the second largest medical society of its kind in the United Kingdom, and one of its main objects is to maintain the character and prestige of the Irish medical schools. It is gratifying to learn that the efforts of the organisation in this direction have for a number of years past been attended with a large degree of success. For instance, one of the grievances which weigh most heavily upon Irish graduates in England arises from the almost universal rule that no candidate is eligible for an appointment on the honorary staff of an English hospital unless he holds the diploma of the Royal College of Physicians in London in the case of a medical, or the diploma of the Royal College of Surgeons of England in the case of a surgical appointment. The advantage thus given to those two colleges is, of course, quite unjustifiable. Thanks, however, to the efforts of the Association, the excluding rule has been repealed at the Bristol General Hospital, the Hastings and East Sussex Hospital (Brighton), and St. Peter's Hospital for Stone, London. We strongly recommend Irish medical men to become members of an association which is capable of rendering such great service to the profession. At the meetings and dinners of the organisation all political and sectarian topics are absolutely excluded. Dr. James Stewart, who has for a long number of years been prominently identified with the Association, will be happy to afford further information to gentlemen requiring it.

FINDABAIR.

THE GENESIS OF SOME OLD IRISH PLACE NAMES.

By REV. J. F. LYNCH.

In the extract quoted from Hackett in "The Danes' Cast" there is mention of a very important name which, up to the present, has not been explained. This is the name Findabair, or Finnabair, which is given by Hackett in the form Finure. Hackett says—"We may remember also that in the Imokilly legends it was from Bally-Finn he first set out on his expedition against the Boars of Imokilly, the time he slew the Torc, who flourished at Glen Torcin (Torc Finn), now Glenturkin, near which the grave is shown where Fionn buried the Boar at Finure," Glenturkin means valley of the white boar (torc finn), and Finure, or Finnabair, means white abair, and, as the grave of the white abair was in the valley of the white torc, it appears that the word abair is explained by the word torc, and means boar. It thus appears that the Irish word abair is cognate with the German eber, Anglo-Saxon eofor, Norse jofurr, Latin aper, Slavonian vepri, and probably the Greek kapros. It is possible also that the English boar, Anglo-Saxon bar, German bar, Lombard pair, and Welsh baedd, have an old connection with abair. Dr. Joyce (Irish Names, vol. ii., p. 274) says—"The compound Finnabhair, old form Findabair, was formerly common as the name of a person, generally of a woman, but sometimes of a man, and it was also used as a place name. As the name of a place, some of the old Irish-Latin writers have translated it campus-albus, white coloured field (Jocelyn, Vit. Patr., c. 94), but I suppose that this is intended to express the fact that Finnabhair meant a whitish place, for I do not think that abhair can be, in any case, the equivalent of campus. O'Curry (Leet, iii., 10) translates Finnabhair as a personal name by "fair-browed." . . . But it may be doubted whether abair here can mean a brow, for, as Mr. Crowe remarks (Proc. R.I.A., MS. Ser., 159), the genitive of abair, a brow, is abrat (thus Eochaidh Abrat-ruaidh Eochaidh of the red brow—a King of Leinster); while the genitive of Find-abair, as a personal or local name, is Find-abrach. It appears, in fact, that there are two different words, both spelled abair in the nominative—Abair, gen. abrat, a brow or eyelash; abair, gen. abrach, (meaning?); and it is the latter word that appears in Findabair. Mr. Crowe, in the same place, translates Find-abair, "bright beam," comparing abair with Lat. apricum; but I do not know on what authority he bases this interpretation.

Dr. Henderson, "Feast of Bricrin," p. 135, has also erred in rendering Findabair "fair eyebrow." The Irish word abair, a brow, gen. abrat, is cognate with the English brow, Anglo-Saxon bru, German brane, Slavonian bruvi, Welsh amrant (eyelid), Greek ophrus, Sanskrit bhru. There is also an Irish word abair which means river, and the genitive of this word is abrach, cf. Gleannamhain, with (valley of the river, aban or arnan (avon), Latin amnis), with the form, Gleannamhain, in Aisling Meic Conglinne. Gleannamhain, or Glennabhrack, or Gleannamhuir, is now called Glanworth, a corrupted English extension of the form Gleannamhuir, which is explained valley of the yew tree, Gleann iubhair, by Joyce, Irish Names, vol. i., p. 445. but this derivation is incorrect. Cf. also Ptolemy's name for the Cork Blackwater, Dabrona, with Glenn Damhain (Glanworth, Chronicum Scotorum, p. 87). In the "Pursuit of Diarmuid and Grainne," Part I., p. 50, there is given a list of the names of the Chiefs of the Tuatha De Danann, which may be compared with the similar list given in "Battle of Ventry," p. 14. In the latter list we have "Na tri Finn Fhinnabhrach," equivalent to "Na tri Finn Fhionnmhuir" of the former list, and this comparison proves that the translator of the Pursuit errs in explaining Fionnmhur as "the white house," for "mhuir" and "abhrach" are genitive forms of abair, the former being a corrupt form. During the course of the present Ordnance Survey in the district of Kilfinane, county of Limerick, the Surveyor obtained the name of a cave near the village from an old man, which was sent on to me in a very corrupt form, and I found it to be the Irish Uath Fhionnabhrach—that is, "Cave of Findabair"

In the paper on the Danes' Cast I forgot to refer to Joyce's "Irish Names," vol ii., p. 219, and "The Chase of the Enchanted Pigs of Aenghus of the Brugh," in Trans. Os. Soc., vol vi. Knock Finnel, beside Lough Gur, over which Gleann na muice duibhe passes to Cladh na leac, or Cladh dubh, at the south side of the lake, means hill of Finn, or Finne. The present form, Finnel, appears in State Papers dated 1200, as Finnen, which represents the Irish Finnine, or Findine, an old genitive of Finne, or Finn,* utilised as nominative. Mr. Owen Bresnan has traced the Black Ditch to Sliabh Belgadain (now Bulgaden), near Kilmallock, which is mentioned at an early date in poem by Gilla Coemain (see Todd Lecture Series, vol iii., p. 163.

The late Rev. W. Seymour, who was for many years in charge of Cahirnarry parish, informed me that he asked the late Bishop Graves what was the meaning of Cahirnarry, and that the Bishop said the name meant "Stone fort of Nora, an Irish princess," but Mr. Seymour was unable to give me any particulars of "Nora." If an old man has not deceived me, the name in Irish is Cathair Fhinnabhrach, or "stone fort of Finnabair," which O'Donovan ("Book of Rights," p. 89), says is also the name of a remarkable stone fort of the kind caled "Cyclopean," near the village of Cill Fionnabhrach (Kilfenora), in the county of Clare. Cahirnarry is in part separated from Ludden parish, by a little stream, named Sruhanederagoole, or "little stream of the oak-wood fork." Keating, when giving the boundaries of the diocese of Limerick, names the ford across the stream, Ath an Coinne Lodain, "the ford of the Assembly of Lodan," the word coinne means an assembly or gathering of people, but of this gathering no tradition has been preserved in the district. In Donald O'Brien's charter of the grant of lands to St. Mary's Cathedral, Limerick, this ford is named "Ford of the Ceinu."

Lenihan ("History of Limerick") gives the names of lands in Ludden and Ballyneety district, forfeited to James, Duke of York, afterwards James II., and one of the names is Leabadh na muice, so that there was a cromlech of this name somewhere not far north of Ludden hill (1). Lodan is a very important name, and nowhere else in Ireland has the name of Lodan Mac Lir been preserved as a local name. Lodan, son of Lear, is mentioned in "Silva Gadelica," p. 118:—"With his right hand towards Lathach bo Lodain mhic Lir, or 'the slough of Lodan Mac Lir's cows,' now called the clar, or 'expanse,' of Derrymore." These were the old names of the place now called Loughmoe—that is, Luachmhagh, or "price-plain," about five miles to the N.E. of Thurles, in county of Tipperary. The Archdeacon of Cashel informed me that the people say that there formerly lived a beautiful young lady in a castle in the great oak wood, who had been imprisoned therein by an enormous enchanted boar, and that a young warrior named Purcell (2) walked along the tops of the trees (the wood being impassable), to the castle, and killed the boar, and married the lady, and obtained Derrymore as reward for slaughter of the boar, and hence the name Luachmhagh. This Purcell was the ancestor of the Purcells of Loughmoe, whose crest is, I believe, a boar's head. Dr. Joyce explains the name Loughmoe, but he does not give this legend; and O'Donovan has incorrectly placed Derrymore in King's County. Lodan is also mentioned in "Bodleian Dinnshenchas," pp. 31, 37; and O'Donovan ("Templemore Parish") gives the legend of Feabal Mac Lodain, from whom was named Lough Foyle—that is, Loch Feabail, "Lake of Feabal." For Sliabh Lodain in Britain, see "Silva Gadelica," p. 105. Professor Rhys ("Hibbert Lectures," p. 129), says: "The association of Llud, or 'King Lud,' as he has come to be called in English, with London, is apparently founded on a certain amount of fact: one of the Welsh names for London is Caer Lud, or Lud's Fort, and if this be open to the suspicion of having been suggested first by Geoffrey, that can hardly be supposed possible in the case of the English name of Ludgate Hill." London, the Roman Londinium, is derived from a nasalised form of Lud, or Lod (3) to which was appended the old terminant an, or on, and the name Lodun is derived from Lod, the Welsh Llud. Spenser, speaking of the aged Hely, says:—

He had two sonnes, whose eldest, called Lud,
Left of his life most famous memory,
And endlesse monuments of his great good:
The ruin'd wals he did reædifye
Of Troynovant, gainst force of enimy,
And built that gate which of his name is hight,
By which he lyes entombed solemnly.

The golden harp of Gar is sounding through the halls of Tara Luachra, and the Iberian warriors have at last awoke, and are marching to Gleann na muice duibhe, in behalf of the old things of that land which the Iberian loves beyond all other lands. Aradh mo mhuirnin, Aradh go brath.

I have some particulars re Gareth in hand for D. P. J., collected from Irish tales both written and oral.

Cahirconlish Rectory.

---

*In the two variants of the tale of the black pig, given by Dr. Joyce and Mr. Hackett, Loch Finne (Lough Finn) is said to be named from Finn, or Finne, and to this name we must also refer the names Ouennekno and Ouennikнion of Donegal district, given by Ptolemy, 130 A.D.

(1) At the north side of Ludden hill is site of Luddemore Castle, forfeited by the Burkes to James Gould, or Gold, Attorney-General of Munster under Sir George Carew. At each side of Ludden hill is a cliff named Leim Dhomhnaill, or "Leap of Domhnall." Domhnall (Donald, Donnell) is Welsh Dyvnwal ("Hibbert Lect.," p. 449), and is the Donwallo of "The Faery Queen"—the name means "Great Domain."

(2) The name Purcell is said by some to be from Latin porcellus, "hoglet." Kanturk, in county of Cork, which represents the Irish Ceann tuirc, means "head of the boar." Dr. Joyce says: "The name shows that the little hill near the town must have been formerly a resort of one or more of these animals, and we may draw the same conclusion regarding the well-known Torc Mountain at Killarny ('Irish Names,' vol. i., p. 478). Every old man in Kanturk, who has preserved a trace of Irish lore, will say that Ceann tuirc was named from the head of the enormous enchanted boar, which was chased from Sidh Tuirc cois imill Leine (Torc Mountain at Killarney) by Domhnall na Gaela (The O'Donoghue), and slain by him on the little hill beside the junction of the rivers named Ealla and Daluadh, in consequence of which the little hill was named Ceann Tuirc. A branch of the Loughmoe Purcells settled at Kanturk, and they claimed that it was their ancestor who killed the enchanted boar on the hill of Ceann Tuirc. The Irish name for Torc Mountain, Sidh Tuirc, shows that Dr. Joyce is not correct, as anyone in whom glows a spark of Irish knows.

(3) Tennyson's "Gareth and Lynette":—
The last tall son of Lot and Bellicent,
And tallest, Gareth, in a showerful spring
Stared at the spate.

OUR WEEKLY STORY

REDSKIN AND WHITE.

"It's an infernal nuisance," said Rutland plaintively, knocking the ash off his cigar and looking at the Inspector for sympathy.

Captain Eviston leaned comfortably back in his big chair.

"Of course, my dear fellow, but what's to be done about it, so long as they are not actually committing any wrong or doing any harm?" It was very hot, and the Inspector spoke lazily, through a cloud of tobacco smoke.

"Not doing any harm!" Rutland shook himself impatiently out of his chair and began to tramp excitedly up and down the Inspector's den. "Don't you think it's sufficiently harmful to have the dirty beggars forever lounging around the ranch, forever turning up in the most unexpected and irritating fashion, forever presenting their evil-smelling clothes and persons at my clean kitchen door. As for Wong, I believe the heathen gives 'em food by the bushel to get 'em to come and play poker with him. He's a born gambler, and would bet the queue off his head against an Indian's scalp-lock if you gave him the chance. And how am I to know how many steers and 'ambs they get away with? How am I to know how many saplings they cut down for their tepee poles? I flatter myself that no man in the Northwest looks after his ranch more closely than I do, but it's impossible to be everywhere at once. Well, if you won't help me with the law, Eviston, I'll have to find some other way of ridding myself of the pack of dirty beggars. I won't have them loafing around the bungalow any more!"

The heat outside was fierce, and sifted through the almost closed shutters and lowered screens at the window of the Inspector's den. Rutland's face was purple, and big drops of perspiration stood on his forehead as he moved rapidly around the little room. Captain Eviston looked at him meditatively and with some amusement.

"I wouldn't do that if I were you," he said at length. "It's hot enough, heaven knows, without exciting yourself unnecessarily. Sit down and let's talk this over."

But Rutland was too wrought up for pacific measures, and continued to pace up and down and puff nervously at his cigar.

He was a big man, whose clean-cut face, in spite of present excitement, looked humorous, and whose clear blue eyes twinkled jovially. As he stamped around the little room it was evident that he was slightly lame in the left leg. The summer before, while on his vacation in England, Rutland had been the victim of an accident under which most men would have sunk, but the buoyancy of his temperament and his magnificent health had saved him, and he had returned with apparently nothing worse the matter with him than a slight lameness caused, as he told his friends, by a severe attack of sciatica. For the subject of his lameness was a sore one with Rutland, and he had spoken to no one of the accident save to Captain Eviston. His greatest consolation was that the halt in his walk was scarcely apparent, and that he could still hunt and do hard riding and "roping" as before.

What was much more noticeable about Rutland than his lameness was his exquisite neatness. In a land where the weather and society permit of extravagant vagaries of dress, Rutland's conventional attire attracted much attention. This orderliness was not wholly personal, however, but extended even unto the management of his ranch and shack. What a yacht or fast horse is to some men, Rutland's shack was to him. The Bungalow was his hobby, and he was rapidly becoming as fussy and particular about it as an old maid. His sensibilities would have been inexpressibly hurt to see any part of it out of repair or in disorder, and its reputation for unapproachable cleanliness and a sort of exclusive superiority had become legendary. Perhaps the crowning luxury of Rutland's establishment was his Chinese cook, Wong. Good cooking among ranchers is about as rare as Kohinoor diamonds, and Rutland's celestial cordon bleu was known and appreciated far and wide.

Some people were of the opinion that The Bungalow was too far from everything, but Rutland liked the solitude, especially as it afforded such unparalleled grazing land for his flocks and herds. Rutland had his own ideas and methods about the breeding of cattle, and he could and would talk on the subject for hours at a time. Most people disagreed with him, but the fact remained that his cattle were the finest to be seen in southern Alberta. Next to the shack they were Rutland's greatest pride and delight. There were delightful stories, widely circulated among the cowboys and half-breeds, that Rutland had his sheep washed and combed once a week and counted his steers every evening.

It was the recollection of some of those apocryphal tales that caused the amused smile to overspread Captain Eviston's face, as he leaned back and looked at Rutland tramping viciously about the room. He could just imagine the state of indignation that was consuming the owner of The Bungalow Ranch at the thought of its desecration by the Indian loafers who insisted on hanging around the place.

"The scoundrels actually come and camp on me!" Rutland was speaking again, plaintively. "Last week fifteen lodges settled down on the Elbow Creek. I'd have sent the whole lot packing if there hadn't been a sick squaw with them!" He dropped limply into his chair.

An orderly knocked at the door, with glasses and a pitcher of iced lemonade, which Mrs. Eviston had thoughtfully sent in.

"It certainly must be an infernal nuisance, as you say, Rutland, to have the dirty beggars loafing around the imaculate Bungalow Ranch," said Eviston, pouring out his guest a glass of the lemonade. "But what under heaven can I do about it, either in my military or civil capacity? The Indians around here have been extremely, I might say almost suspiciously, good for a long while, and we can't afford to be too hard on them. And unless you have some specific complaint to make, as a Justice of the Peace I don't see how I am to proceed against them."

Rutland sipped his lemonade discontentedly.

"You're a most disappointing chap, Eviston," he said. "I thought surely you could help me. See here, why can't you indict them for trespassing?"

"My dear fellow, this isn't a little corner of England! After all, the beggars can't be expected to know just where the sixty thousand acres of The Bungalow Ranch begin and end, and in their visits to and from neighbouring reservations they have to camp somewhere. Why, there are twenty lodges of Kootenais camping down here, a quarter of a mile from us, and it would never occur to me to tell them to move on. After all, they have some primeval rights, you know. It really won't do for us to interfere with their peaceful movements."

"Well, they may be peaceful to them, but, by Jove, they bring no peace to me! Besides, camping on my place is not what I most greatly object to. It's their infernal exasperating way of harging around the shack. I can't come near it but that I see half a dozen of their bucking pintos tied to the fence or just disappearing behind the stables. I can't be away a day but, on coming back in the evening, I encounter any number of Piegans or Crows lounging around the enclosure. I find them sitting on the grass smoking when I go to open the windows in the morning. I believe they actually sleep on the verandah—my verandah—at night! I've threatened and scolded and sworn at 'em, and I've promised 'em I'd report to you and have 'em locked up. But nothing has the slightest effect. There seems to be some confounded fascination about the place for the beggars."

Captain Eviston blew a great double ring of tobacco smoke with a last puff at his cigar. He put the stub in the ash-tray, and looked at his friend meditatively and silently.

"So you've threatened and scolded and swore at them," he said, at length. "Why don't you try frightening them as a last resort—une derniere resource? Scare 'em off the place, since that is all that's left to be tried. It ought to be easy—heaven knows they're as easily frightened as children; and for you, Rutland, I've never yet seen you when you weren't ready for a practical joke. Turn your talents to use, my dear fellow, and joke the whole lot of Piegans, Nez Perces, and Crows off the never-sufficiently-to-be-taken-care-of Bungalow Ranch!"

Rutland put his empty glass down on the table and looked narrowly at Eviston.

"I think you must be joking yourself," he said, a little stiffly, and then, suddenly, he burst out laughing.

"By Jove, Eviston, that isn't a bad suggestion—if it can only be done. But I haven't the shadow of a——" He was staring absently up at the ceiling. All at once he began laughing again. "Don't speak to me!" he said, getting up and shaking himself. "I have an idea, and I'm going home to think it out. I'll let you know about it if it comes to anything."

He was still laughing when he passed through the little sittingroom to the verandah, where he found Mrs. Eviston sewing in the cool air which was beginning to be felt after the heat of the early forenoon.

"You had much better stay and have tea with us," urged the Captain's wife.

"Thanks awfully, Mrs. Eviston, but I can't. It's quite impossible, as I have to get back to the ranch."

Mrs. Eviston could still hear him laughing as he got on his horse and rode off.

"Arthur," she called to her husband, "what's Jimmie Rutland laughing about?"

"Don't know," replied the Captain, getting up and coming to the screened verandah door. "Wish I did."

It was eight days afterwards, in the early morning, when one of Rutland's cowboys galloped over the ten miles of prairie lying between The Bungalow and the detachment, and presented himself at the Inspector's quarters with a hastily-penciled note fo rCaptain Eviston.

"The idea has materialised! Be at the Bungalow at four, this afternoon, if you want to see some fun and yours truly avenged. This is strictly entre nous. Can you lend me your interpreter for the afternoon? If so, bring him, and oblige.—Yours,

"J. R."

Captain Eviston scribbled on a piece of paper: "All right. I'll be with you!" and handed it to the man.

It was just four when the Inspector drew up beside the long, wide verandah which gave The Bungalow an added air of distinction, and had incidentally suggested the name. As he jumped out of the cart and threw the reins to the interpreter, whom he had brought with him, Rutland came quickly out of the shack. There was about him an air of excitement and the pleased expression of the man who knows the joke.

"Come in here," he said, dragging Eviston into the house, "and have a drink while I tell you all about it." He laughed delightfully as he moved the Scotch and soda over to his guests.

"It's this way. I'd thought about the whole confounded thing until I was pretty nearly crazy. Your suggestion the other day set me thinking on a different tack, and, by Jove, I've hammered out a little scheme which I think will scare the beggars out of their boots—moccasins I mean—and set them packing in a hurry."

"Nothing actionable, I hope," murmured Eviston. "I'd hate to have you up before me——"

"No—no, nothing of the kind," gurgled Rutland, who was bubbling over with satisfaction. "In the first place, we are to have a first-class tea-dance here shortly." He pulled out his watch. "By Jove, it's almost time for them to be here. You see I've invited a lot of the Lord High Muckamucks among the Indians, the medicine men, and the chiefs and young braves to meet me here this afternoon for a tea dance. There's ten gallons of the strongest tea to be bought at the H. B. Company's store boiling on the stove under Wong's eye at this minute. By the way, I've promised to cut his queue off if I see him so much as speak to an Indian after to-day. And there's tobacco by the pound waiting for 'em, so I think on the whole they'll enjoy themselves. And when they get a little mellowed by the tea and tobacco, I will take a hand in the proceedings. I——" he leaned over and spoke a few words to Eviston in a low tone.

"By Jove!" said the Inspector, and there was laughter and wondering admiration in his choked voice. "It's too good to be true! I wouldn't miss it——" A confused murmur of voices and the tramp of ponies and dull thudding of a tom-tom became suddenly audible to the two men. Rutland jumped up and went to the window.

"They're coming Eviston," he said excitedly. "Now for it!" He went out on the verandah, and the Captain followed, still shaking with suppressed laughter.

Up the carefully made road which wound through The Bungalow's fifty-acre front enclosure, they passed a variegated highly-coloured procession of bedecked Indians on their equally gaily decorated ponies. Clouds of dust accompanied them, out of which now and then a fractious pinto would emerge in an effort to gallop across the cool grass, only to pulled into the ranks again by the rider, conscious that The Bungalow's owner was looking at him from afar. As the men cantered along they chattered like monkeys in a cocoanut tree, almost drowning the sound of the tom-tom borne proudly in front by a young Nez Perce. On each side of the Nez Perce were ranged two musicians with strange instruments upon which, later on, they made horrible and deafening noises. Behind them came the crowd of medicine men, chiefs, and young bucks.

Rutland saw The Bungalow's sacred precincts invaded by the red man for the first time with any feeling approaching that of pleasure.

"I think I've invited enough to spread the news of this afternoon's entertainment far and wide, don't you, Eviston?" he inquired eagerly. "And look what a choice lot. There's Medicine Pipestem, the blood conjurer. If I can only get that hoary sinner frightened—! And there's Wild Elk, the Piegans' noted medicine man, and half a dozen others. My! but those Crow braves are gorgeously arrayed. Except for their complexions they would resemble the lily of the field, for certainly they toil not, neither do they spin, and yet Solomon—and so on. I say, I think my party will be a great success! What are the beggars doing now?"

As the head of the procession got within a few yards of the shack the leaders suddenly struck the broncos with their quirts and the whole band of Indians circled madly past, shouting and saluting the two white men on the veranda. As suddenly they reined their ponies in, and leaping from them tied them to the fences and walked in groups to the house. Rutland welcomed them gravely and they seated themselves in a large semicircle upon the grass before the shack.

A tea-dance is to Indian social affairs pretty much what an afternoon reception is to our society functions—an extremely mild form of pleasure cheered by the cup that does not inebriate. The Indians have the advantage over us in that they are allowed smoking and dancing as extra amusements, but about the same amount of laughing and loud talking goes on as at an afternoon reception on Fifth avenue. It was some time before they had settled down comfortably and ceased their chatter sufficietly to allow Rutland to make his speech to them, which he did with the aid of the interpreter. Holliday, the interpreter, a tall, loose-jointed youth, half Scotch, half Indian, was the delight of the Inspector's heart.

"Holliday 'll tell them anything you say—straight," he had whispered to Rutland, and Rutland had confided freely in him. But it was a delicate matter to suggest to the Indians just what Rutland wished to suggest and no more or less.

"I say, Holliday, just tell the beggars that I'm awfully glad to see the whole boiling of them here this afternoon," hazarded Rutland diffidently. "Tell 'em I'm particularly glad to see 'em to-day because I've had a—er—a—warning from the Gitchi Manito that I won't see them ever again at The Bungalow." Rutland looked inexpressibly grieved as he repeated that part of his speech to Holliday. "I say don't make any mistake about that—be sure and tell 'em I've had a warning from the Great Spirit."

Holliday nodded with a rather puzzled expression on his good-natured face, and translated Rutland's sentiments into understandable Blackfoot. A subdued murmur ran through the line of Indians crouched upon the ground, and the medicine men put their heads together and talked in excited undertones. The young bucks eyed Rutland with a new awe, and moved closer together over the short grass. Rutland smiled inwardly with a great satisfaction at the impression his words had produced.

"And tell 'em, Holliday," he went on, "emboldened by the success of his speech so far, "tell 'em that I regret that the Great Spirit has so ordered that The Bungalow should see no more of the fine Piegans and Crows and Nez Perces whom I see here before me for the last time." Rutland's English left much to be desired, but the oratorical effect was grand. "Tell 'em I salute them all, especially the medicine men, who are my brothers, and that now we will have some refreshments."

The concluding words of Rutland's speech, though on a lower plane of sentiment than the beginning, were warmly welcomed, and the tea and tobacco passed around by Wong and Holliday disappeared with astonishing rapidity. Each Indian had a large tin cup from which he drank his sixi-kimmi with unceasing activity and relish, and on apparently the same principle that an engine takes in water, for no sooner was a sufficient supply consumed than it was immediately converted into energy, and the Indians would begin to dance to the fierce accompaniment of the tom-toms and shrill whistles, and when the steam generated was all used up, the empty boilers were again and again refilled and the process of steam-making went on unabatingly and gaily.

For an hour and a half did Rutland and Captain Eviston sit upon the verandah of The Bungalow and watch the noble Red Man's unflagging zest in the consumption of tea and the smoking of tobacco, varied by shuffling of moccasined feet in the dance. The dancing was decorous, almost perfunctory, however, and reminded one again of the hollow pleasures of an afternoon reception. Sometimes it consisted of no more than a stately march round the enclosure. Occasionally one of the younger braves, excited by the dizzy concoction of strong tea into which had been dipped chewing tobacco, would fling himself to his feet and begin a fantastic movement, but the excitement soon passed, and he would seat himself and attack his cup of sixikimmi with renewed vigour. Some of the old chiefs were nodding half asleep in a trance of pleasure over the unlimited supply of good drink and tobacco.

The afternoon was beginning to wane. The sun had set in his accustomed midsummer splendour behind the Rockies, and, although it was still quite light, the first faint shadows of the coming twilight were beginning to fall over the prairie.

Suddenly Rutland leaned over towards his friend.

"I can't stand any more of this, Eviston," he said. "I think it's about time I played my hand. Come on!" The two men descended the verandah steps and seated themselves just below them on the grass and in full view of the semi-circle of Indians, who were surprised into silence by Rutland's manoeuvre.

"Remember, you are to talk unconcernedly to me, Eviston, or I'll never get through this thing without laughing." He pulled from his hip pocket a keen, two-edged knife with a heavy handle, known as the "half-breed knife." It looks very much like the bowie knife and is about as deadly. Rutland leaned back comfortably against the steps of the verandah, stretching his legs out on the grass in front of him, and conscious that the Indians were watching his every movement with intense curiosity and interest. Eviston began talking to him. It was pure nonsense what he was saying, but that was no matter—the effect was good.

As Eviston talked, Rutland passed the blade through his fingers, feeling the keen edges. Suddenly and unconcernedly he plunged the knife up to the hilt into his left leg. When he drew it out carelessly, not a drop of blood fell from the wound. He plunged it again, and so skilfully that it buried itself in his quivering limb just above the knee-cap.

A perfect tumult arose among the Indians, the young bucks jumped to their feet with muffled yells of terror and the medicine men muttering together and clutching their medicine bags. It was evident that he was under the protection of the Gichi Manito—or was it the Great Evil Spirit? they asked each other, with chattering teeth. That such things should be done, and without drawing a drop of blood—! Who could understand such medicine as this? It were better to be dead than to see such things. O! that they had not come to the Bungalow Ranch!

But Rutland paid no attention to this excitement. Again and again, as he talked interestedly with the inwardly convulsed Inspector, did he plunge the sharp, two-edged blade into his long-suffering left leg. Now it was buried to the hilt in the calf, now it had cut the leather of his boot and transfixed the instep, now it stuck hideously into the bended knee. The Indians sat in huddled, frightened heaps, the perspiration standing out on their foreheads and their gaze fixed, as if hypnotised, on the white sorcerer. Stifled groans of terror, and hoarse, croaking exclamations of fright were heard. Old and young braves were shaking as if with a chill. A Crow medicine man sprang into the air as if electrified, his robe droping from his quaking shoulders.

The Indian of the tom-tom sat rigid with fear, the sticks falling through his nerveless fingers. Rutland looked at him out of the corner of his eye and recognised in him a particularly objectionable young Nez Perce whom he confidently believed had often slept on the immaculate verenda of The Bungalow. Drawing the knife out of his knee, he felt the edge carefully, and then, with a blow which would have disconnected any ordinary foot from its leg, he brought it down upon his ankle. The man who invented this must have known all about his business, for it gave way only partially, and the foot still dangled in a sickening, dreadful way from the half-severed limb. The tom-tom rattled to the ground and rolled aimlessly over the grass until it hit a half-comatose chief, who yelled with terror at the unexpected touch.

And then quickly and silently one by one did those Indians melt away. In the fast-falling twilight did the fringe of terror-stricken humanity disappear. Whole segments of the semi-circle droped off mysteriously in the gathering darkness and there were much plunging of broncos and swish of whirling quirts. The rout became infectious and precipitate, and the Piegans and Crows and Nez Perces, who arrived so gaily and vociferously in the brilliant afternoon, now fled noiselessly and fearfully back through the night

When they could laugh no more Rutland rolled over to the step and, propping himself against it, tenderly turned up the remains of his cut and tattered trouser-leg, and as he looked he laughed afresh, for from midway the thigh down, Rutland's wonderful left leg consisted of the latest skilful medico-mechanical contrivance in cork and marvellous joints, now slashed and gouged and wrenched beyond repair.

"It cost me seventy-five dollars," he gasped when he could speak. "But I've another, Eviston. I bought two in case of accident. It's a wreck—there's no doubt of that—and it cost seventy-five dollars, but Lord! this afternoon's entertainment was cheap at that, and The Bungalow's rid of those infernal ——" and he began laughing again

NOTES AND QUERIES.

[We open this week a Notes and Queries Department, which we trust may prove useful to our readers. We shall gladly insert in it any queries or replies that may be sent to us.—Ed. D. P. J.]

IVY AND ITS EFFECT ON BUILDINGS.

To the Editor of the "Dublin Penny Journal."

5th May.

Dear Sir—Might I ask you to state in an early number of the "Journal" what effect ivy has on ruins and other buildings? I have seen it stated somewhere, I think, that its action is most injurious, that, in fact, when the stem and branches have come to a certain size it is able to pull down the strongest wall. If this be so, it would be a useful subject to draw the attention of our District Councils and other local bodies under whose charge so many of our venerable ruins are placed. Whenever the Board of Works take charge they seem invariably to have the ivy removed, which seems to corroborate what I have stated. The ivy is picturesque, but preservation is of more importance than appearance, and when you inform us definitely on the matter, I hope that no time will be lost in saving our ruins throughout the country, which now seem threatened by the action of ivy; it will be quite easy to have the stem cut near the root. —I am, yours faithfully,

BORU.

Mr. Thomas O'Connor, 32 Vince street, Smethwick, Belfast, writes:—I recollect reading an account in, I think, "The Irish Builder," some years ago, of the building of Nelson's Pillar. Can you or any of your readers give me some particuplars of this work, who did it, and what it cost? Also, who was responsible for the erection of the Wellington Obelisk in the Phœnix Park?—Thos. O'C.

Names of Authors wanted.—By whom were the following works written?—"Vindication of the Irish Nation, and Particularly of the Roman Catholics." By Julius Vindex. Dublin: Printed for the Author, 1802; and "Paddiana, or Scraps and Sketches of Irish Life." London, 1848, ascribed by a bookseller to Dr. Blenkinsop, which appears, however, to be an assumed name.—EVOC.

CATS AMONG THE EGYPTIANS.

The tutelar deity of cats was Diana, and, according to Plutarch, the cat was not only sacred to the moon, but was an emblem of it. Hence cats were treated with a peculiar consideration in the land of the pharaohs, the death of one being regarded as a great family misfortune. Egyptian cat funerals were celebrated with the greatest pomp and ceremony, their late owners showing respect by shaving off their eyebrows, and wearing sackcloth for nine days. In the time of Moses it was a capital crime to kill a cat, and we are told by Diodorous how a Roman soldier who killed one was tried, sentenced, and finally put to death.

THE PARISH CHURCH OF THE OLD IRISH PARLIAMENT*

By C. LITTON FALKINER.

(Copyright: All rights reserved.)

I.

Honourable as is the antiquity of the parish of St. Andrew's, and varied as are the sources of interest from which it derives its importance in the history of our city, it is not primarily upon its priority in the roll of our Dublin parishes that its attraction depends. Indeed, notwithstanding that the precise date of its origin is lost in the haze of history, and runs back to the days of the Scandinavian Kingdom of Dublin, it may be doubted whether the strictness of antiquarian pedantry would class St. Andrew's among the ancient metropolitan parishes at all. For, lying outside the walls, neither the church itself nor any part of the parish could at any time be reckoned as part of the mediæval city, whose eastern boundary terminated at Dame's Gate, just below the Castle Yard. It is, in fact, as the first of suburban, rather than as the most ancient of city parishes that St. Andrew's claims pre-eminence, a fact which is sufficiently emphasised by the language of an Act of Parliament so modern as the 17th and 18th Charles II., chap. 7, in which the Church of St. Andrew's is still described as "in the suburbs of the city of Dublin." It requires, indeed, no inconsiderable effort of the imagination to picture the parish to which the church of St. Andrew's originally ministered in the days when it was the pioneer of that development of our metropolis in a south-easterly direction which has not yet ceased, when all Dublin lay within the walls, when green fields stretched right up to the Castle and down to the banks of the Liffey, and when only the village of Hogges, or Hoggen Green, lying near the eminence on which the modern church now stands, and the monastery of All Hallows intervened between the city and Ringsend.

The erection of a church outside the city walls, yet immediately adjacent to them, was almost certainly due to the Danish occupation. Like St. Bride's and St. Michan's, St. Andrew's Parish is of Danish origin. Almost the earliest mention of St. Andrew's itself suggests this. It occurs in the register of the Priory of All Hallows, which records a grant in the year 1241 of land described as situate in "Thingmotha, in the parish of St. Andrew's, Dublin." (1.) Now the Thingmount was a conical hill some fifty feet high, used as the meeting place of the Danes of Dublin, and Mr. Haliday has conclusively located its site as immediately adjacent to that of the present church, where, indeed, it remained down to the year 1682. It was hard by this spot that Henry II. was lodged on his arrival in Dublin in a palace of earth roofed with wattles, which the old chronicler, Roger de Hoveden, describes as having been "built near the Church of St. Andrew the Apostle, without the walls of the city of Dublin." (2.) The church thus referred to lay eastward of the present edifice, occupying with its churchyard a plot of ground on the south side of Dame street, about where the Munster and Leinster Bank now stands, and there it remained down to the close of the sixteenth century. What manner of appearance the ancient church presented there is now no sort of record; but of its importance among Dublin churches as early as the 13th century there is good evidence. The charter granted by Henry de Londres, Archbishop of Dublin, to the Dean and Chapter of St. Patrick's in 1219, assigned the Church of St. Andrews to the support of the Precentor of this Cathedral. This was the commencement of an enduring connection between the parish and the cathedral, which, however, was not altogether to the advantage of the former, since the duties of this parochial incumbency not unnaturally sat lightly on the cathedral dignitaries. The parish remained in the charge of the Precentor for a space of some three centuries, during which history is almost silent. It is more than probable that the union of the living of St. Andrew's with the Cathedral Precentorship was due to the decline in the importance of the parish as a residential suburb. According to Stanyhurst, who wrote in the sixteenth century, George's Lane, the modern South Great George's street, which is shown in Speed's map as practically the only inhabited street in the parish, was anciently a place of more consequence. To use his own words. "An insearcher of antiquities may (by the view there to be taken) conjecture the better part of the suburbs of Dublin should seem to have stretched that way. But the inhabitants being daily and hourly molested and preided on by their prolling mountain neighbours, were forced to suffer their buildings to fall into decay, and embaied themselves within the city walls." (3.) Stanyhurst narrates in proof of this assertion a striking illustration which vividly recalls the dangers of Dublin life in those early times, and which is worth quoting as indicating the origin of an important thoroughfare in St. Andrew's parish. "Among other monuments there is a place in that lane now called Collet's Inne, which in old time was the Escaxar or Exchequer, which should imply that the Prince's court would not have been kept there unless the place had been taken to be cocksure. But, in fine, it fell out contrarie. For the baron sitting there solemnlie, and, as it seemed, retchleslie (recklessly), the Irish, espying the opportunity, rushed into the court in plumps, where, surprising the unweaponed multitude, they committed horrible slaughters by sparing none that came under their dint; and withal as far as their Scarborough leisure would serve them, they ransacke the prince's treasure, upon which mishap the Exchequer was from thence removed." Whether or not the allocation of its revenues to the Precentor indicates that the declension of his parish in the scale of importance had begun so early as the time of Henry de Londres it is certain that the parish fell gradually into decay, and by the middle of the 16th century it had ceased to justify its continued independent existence. Accordingly, in the administrative readjustment which followed the Reformation, Archbishop George Browne united the parish of St. Andrew's to that of St. Werburgh's; "In regard there are so few parishioners, and the income so small that there is not sufficient to maintain a clergy-

DUBLIN CASTLE.

THE CASTLE OF DUBLIN TWO CENTURIES AND A HALF AGO.

man." (4.) Thenceforward the church ceased to be maintained as such. In the same year which witnessed its amalgamation with St. Werburgh's, one John Ryan, a merchant, obtained a lease for twenty-one years of "the Rectory of St. Andrew the Apostle, and also the chapel of St. Andrew and the cemetery of said chapel, together with a garden, three orchards, and a dove house, for the yearly rent of twenty-four shillings and four pence." (Mason's "St. Patrick's," p. 32.) Such was the value of Dublin ground rents three centuries and a half ago (4a). A few years later, in 1561, the church was given up, almost literally, to the tables of the money-changers, for the Lords Justices recommended as the fittest place for the mint, "The Castle of Dublin, with the help of the chapel next without the gate;" and in the catalogue of churches in the city and suburbs of Dublin, given by Staneyhurst in 1586, "St. Andrew's, now profaned," is the last on the list. (5.) Thirty years or so after the suppression of the parish the ancient edifice suffered a still more marked degradation. The Precentorship had fallen into the hands of one Sir Arthur Athy, who had been presented to it by Robert Earl of Leicester, the husband of Amy Robsart. Athy appears to have been a soldier, but otherwise had nothing to do with the Church Militant, for he was not even in Orders; and on May 31, 1581, he demised his chantership to the Earl, "the chanter's manse only excepted," for a term of fifty years, at the yearly rent of £60 Irish (6.) Thereupon the church was turned into a stable and yard for the Viceroy, its situation in the immediate vicinity of the Castle rendering it extremely convenient for this purpose.

With the sacrilege of Precentor Sir Arthur Athy—for the transaction deserves no better name—the history of the ancient Church of St. Andrew's terminates. For close upon three-quarters of a century nothing was done to restore or replace it. But the conversion of the edifice to these base uses led to not the least interesting episode in the history of the parish. Whatever the verdict of history on the errors and imprudences of Archbishop Laud, the sincerity of his zeal for the orderly government of his Church according to his conception of it, and his resolution to repress and correct ecclesiastical scandals and abuses, have never been called in question. The debasement of the Church of St. Andrew's to profane uses afford an instance of the thoroughness of his supervision of Church affairs. From the year 1603 to 1635 the Precentorship of St. Patrick's was held by Athy's successor, Dr. George Andrews, who joined with this dignity the Deanery of Limerick. Andrews appears to have asserted his rights as incumbent, and in 1631 obtained a decree in the Chancery Division of the Court of Exchequer, in a suit against the Crown for the recovery of his church, averring that "the parishioners were ready and willing to be at great charges in re-edifying, building, and beautifying the same church." (7.) An injunction issued accordingly to Lord Chancellor Loftus, as one of the Lords Justices of Ireland in the absence of the Deputy, to deliver up possession to Andrews as rector. Loftus, however, did not immediately obey. For though he wrote to the Lord Deputy, Sir Thomas Wentworth, then on the eve of entering on his momentous Viceroyalty, that "the church may not, therefore, any longer be continued in its former use, so as it will be fit that some of your servants do think of providing you another stable," steps were taken to render the decree of the Exchequer abortive, and, by the procurement either of Loftus or of Strafford himself, a King's letter issued, staying the injunction and continuing the Crown in possession till the new Lord Deputy should arrive. Hereupon Andrews, who was evidently a man of resolution, laid the matter before Laud, who, though not yet Archbishop of Canterbury, was known to be the guiding spirit in the ecclesiastical policy of Charles I., as well as the firm ally of the new Lord Deputy. "The Church of St. Andrew's in Dublin, Andrews wrote on March 26, 1632, "was 460 years ago annexed to the Chantership of St. Patrick's, Dublin, of which I am the incumbent. About fifty years ago the incumbent (Sir George Athy, Knt.) being absent, it was (horresco referens) turned into a stable for the Deputy's horses, it being close to the walls of Dublin Castle." (8.) Laud lost no time in laying the matter before Strafford, and received from the latter an undertaking to investigate the matter. Nor was he content to leave the matter here. For Strafford had scarcely seated himself in the Irish Government 'ere he received a lengthy letter from the Bishop of London on matters affecting the Church of Ireland, the very first paragraph of which was devoted to the affairs of St. Andrew's (9): "I humbly pray your lordship," Laud wrote, "to remember what you have promised me concerning the church at Dublin, which hath for divers years been used as a stable by your predecessors, and to vindicate it to God's Service, as you shall there examine and find the merits of the cause." Strafford, it is evident, lent a friendly ear to Laud's representations, for shortly afterwards in an official letter to England, in which he made complaint of the ruinous condition of Dublin Castle, he observes that "there is not any stable but a poor, mean one, and that made of a decayed church, which is such a profanation as I am sure his Majesty would not allow of; besides, there is a decree in the Exchequer for restoring it to the parish whence it was taken. I have, therefore, got a piece of ground whereon to build a new one." (10.) And a little later he wrote to Laud:—"For the stable to be restored I have already given orders for bouncering out the churchyard, and will have another built by June next, and then, God willing, turn back to this church all which the King's Deputies formerly had from it." (11.)

Whether in consequence of the removal from the charge of the parish of Dean Andrews, who, having earned the disfavour both of Strafford and Laud by endeavouring to procure the insertion of certain Irish articles in the articles of the Church of England, was kicked upstairs into the pauper bishopric of Ferns and Leighlin, or owing to the troubles of the times, no effective steps were taken for the restoration of the old church, which, though it ceased to be used as a stable, was suffered

to fall into ruin, notwithstanding that an assessment seems to have been levied at this time to provide funds for rebuilding of the glebe, which had been excepted from Athy's lease to Leicester. A few years later, in 1644, Sir George Wentworth, a brother of Strafford, obtained a lease of the glebe for forty years at a rent of forty pounds per annum (12), and on the ground so obtained he built a house at a cost six hundred pounds. The glebe had stood on the north side of Dame street, which about this time began at length to be utilised for building purposes. Prior to Strafford's time the only residence in this direction was Chichester House, formerly Cary's Hospital, which Sir Arthur Chichester, the well-known Deputy of James I.'s reign, had made his home in consequence of the pestilential condition of the official residence at Dublin Castle. The intervening space between Chichester House and the city walls now began to be occupied by a succession of stately mansions, which, with their spacious grounds stretching down to the river, covered the whole area from the northern side of what are now Dame street and College Green back to the Liffey. Of these dwellings, the first was built by Sir Christopher Wandesforde, Master of the Rolls in Ireland during Strafford's administration, who took up his abode in a house near the modern Grattan Bridge "with a garden and orchard leading down to the waterside, where might be seen the ships from Ringsend coming from any part of the kingdom, from England, Scotland, or any other country, before they went up to the bridge." At the time of the Restoration the chief of those houses were inhabited by Arthur Annesley, Earl of Anglesey and Lord Treasurer of Ireland; by one John Crow, an eminent citizen of the day; and by Sir Maurice Eustace, the Lord Chancellor. Their memory is preserved for us in the three streets of Anglesea, Crow, and Eustace street, which were formed along their respective sites on the demolition of these mansions a generation later. The extension of the city was, however, by no means confined to College Green. It included the district of the Steyn or Lazy Hill, the names then applied to what are now College street and Brunswick street, and the district behind them towards Ringsend.

To the growth of Dublin without its eastern wall and the covering of Hoggen Green and its vicinity with houses, is due the revival of St. Andrew's as an effective parish. A residential district so fashionable as the neighbourhood had become could not but need a church in its midst, and the accommodation at St. Werburgh's was probably inadequate to the demand. Accordingly, in an Act passed in 1665 for the provision of ministers in cities several sections were devoted to the revival of "the Church of St. Andrew's in the suburbs of Dublin," and the incorporation with it of Lazy Hill. (13.) The third section sets forth the state of the case in the following terms:—

> "Whereas, the parish church of St. Andrew's, in the county of the city of Dublin, hath been wholly demolished for these many years past, and no effectual care taken for the re-building thereof, whereby the inhabitants of the said parish and of Lazars, alias Lazy Hill, have had no place within themselves for the public service of God, to the great dishonour of God and the discomfort of the people, may it therefore be enacted that the ambite and tract of ground commonly called the Stane, alias Lazar, alias Lazy Hill, be constituted and made part of the parish of St. Andrew's aforesaid."

Thus the whole district of what is now the parish of St. Mark's was added to St. Andrew's, and so remained for above forty years, when it was severed, as will be seen later on.

13. Statute 17th, 18th Charles II., cap. 7, sections 3, 4, 5, and 6.

by a statute of Queen Anne* The Act proceeded to provide for the re-building of the parish church by the voluntary contributions of the inhabitants; to ordain that it should be presentative as a vicarage; to nominate as the first Vicar Dr. Richard Lingard, a distinguished Fellow of Trinity College, and to appoint Arthur, Earl of Anglesey, his Majesty's Vice-Treasurer, Sir John Temple, Master of the Rolls, whose former residence in the parish is commemorated by Temple Bar, and Sir Maurice Eustace, Knight, a nephew of the Lord Chancellor of that name, to be churchwardens of the parish for the first two years. Power was given to these officers to make an assessment upon the inhabitants for the building of the church and the relief of the poor of the parish. The ancient rights of the Precentor of St. Patrick's were specially recognised in the 6th section of the Act, which, after reciting that "the rectory of the church of St. Andrew's, together with certain houses and their backsides enclosed within the churchyard, have anciently belonged to the Precentor of the Cathedral of St. Patrick," enacted that the precentor for the time being should continue to be rector of the parish, and appropriated the sum of £10 per annum to be paid to him by the vicar.

Thus far the description here given of the ancient history of the parish of St. Andrew's has been based upon such scattered fragments of information as can be culled from various extraneous sources. But in the post Restoration history, we shall tread on firmer ground, for from the date of the reconstitution of the parish under the Act just cited, we have the invaluable assistance of the admirably complete records which are in the custody of the incumbent, and which, despite the demolition of the church erected in 1670, and the destruction by fire of its successor, have been fortunately preserved. The vestry books commence with the year 1670, and the first of them, which embraces a period of thirty-six years, throws much light on the rebuilding of the church and the condition of the parish in the last quarter of the seventeenth century. The minutes of the first vestry meeting record a resolution passed on April 5, 1670:—"That according to the tenor of our Act of Parliament, the church shall forthwith be built on the place agreed upon, being a certain parcel of land lying within the said parish, commonly called the old Bowling-green, given unto the said parish by the Bishop of Meath for the fore said use, so far as his interest is therein."

The site so chosen was considerable eastward of the site of the former church, immediately adjacent to the ancient Thingmount, which had been preserved as public ground for the recreation of the citizens down to the year 1661, and the Bowling Green very probably occupied the site formerly devoted to the grounds round Tib and Tom, a small range of buildings adjacent to the mount, where, according to the historian Harris, the citizens amused themselves at leisure times by playing at keals or ninepins—a pastime which has left its record in an old proverb, "He struck at Tib, and down fell Tom." In that year it had been leased by the city authorities to Dr. Henry Jones, Bishop of Meath, at a small rent, but with a proviso that "a passage six feet wide and thirty feet square, from the top to the bottom of the hill, should be preserved to the city for their common prospect, and that no building or other thing should be erected on the premises for obstructing of the said prospect." But by 1670 this reservation had been so far ignored as to be no longer worth insisting on. No objection was taken by the Corporation to the erection of the church, and a few years later, as we have already seen, the Thingmount, which by that time had become entirely surrounded by buildings, was utterly demolished.

No time was lost in proceeding with the building of the church, which from the first was modelled upon the plan which, though rebuilt at the end of the 18th century, it retained down to 1860. The Vestry Book records a resolution passed on April 18, 1670, "that the oval model drawn by Mr. William Dodson shall be the model according to which the parish church of St. Andrew's shall be built." Dodson appears to have been at the head of his profession in the Dublin of his day, and to have been much employed by the Government, under whose auspices he was responsible for the laying out of the Phœnix Park, as at first designed. It does not appear from whence he drew his inspiration in choosing this oval design; nor has any sketch of the seventeenth century church come down to us. But, inasmuch as the foundations were utilised in the rebuilding a century and a quarter later, and the old shape substantially preserved, the form cannot have differed materially from that of the Round Church, as was commonly called, descriptions of which are given in Brewer's "Beauties of Ireland," as well as in Cromwell's "Excursions Through Ireland."

(To be continued.)

*It is a curious circumstance that the Roman Catholic parish of St. Andrew's was constituted in the same year (1708) which witnessed the severance of the district comprised in it from the civil parish of that name.

WISE SAYINGS—FROM THE IRISH.

(From the "Dublin Penny Journal" of 1832.)

The following passages have been translated from the Book of Balimote, fo. 75. The translations are given, as the original is too obsolete for the present purpose, and the necessary explanations to render it inteligible would require too much room. The first paragraph is from the advice of Cormac Ulfada (the long bearded), to his son, Cabre, Anno 254—

"No fellowship with a king—no falling out with a madman—no dealing with a revengeful man—no competition with the powerful—no wrong to be done to several classes of persons, excited to anger, viz:—a bard, a commander, a woman, a prisoner, a drunken person, a druid, a king in his own dominions.—No stopping the force of a going wheel by the strength of hand—no forcing the sea—no entering a battle with broken hands—no heightening the grief of a sorrowful man—no merriment in the seat of justice—no grief at feasts—no oblivion in ordinances or laws—no contention with a righteous person—no mocking of a wise man—no staying in dangerous roads—no prosperity shall follow malice—no coveting of skirmishes—a lion is not a safe companion to all persons—three deaths that ought not to be bemoaned: the death of a fat hog, the death of a thief, and the death of a proud prince—three things that advance the subject to be tender to a good wife, to serve a good prince, and to be obedient to a good governor."

"The son of Fithil the wise, asked him what was the best thing to maintain in a family or a house?—Fithil answered, 'a good anvil.'—'What anvil?' says the son—'a good wife,' says Fithil—'How shall I know her?' says the son—'by her countenance and virtue,' says Fithil, 'for, the small short is not to be coveted though she be fair-haired, nor the thick short, nor the long white, nor the swarthy yellow, nor the lean black, nor the fair scold or talkative woman, nor the small fruitful who is fond and jealous, nor the fair complexioned, who is ambitious to see and be seen.'—'What woman shall I take?'—'I know not,' says Fithil,' though the large flaxenhaired, and the white black-haired, are the best; but I know no sort fit for a man to trust to, if he wishes to live in peace.'—'What shall I do with them, then?' said the son.—Fithil answered, 'you shall let them all alone, or take them for good or evil, as they may turn out, for until they are consumed to ashes, they shall not be free from imperfections.'—'Who is the worst of women?'—'Becarn.'—'What is worse than her?—The man that married her, and brought her home to his house to have children by her.'—'What can be worse than that man?'—'Their child, for it is utterly impossible that he can ever be free from villainy and malice.'"

"Wisdom is what makes a poor man a king—a weak person powerful—a good generation of a bad one—a foolish man reasonable—though wisdom be good in the beginning, it is better at the end."—Hardiman's Irish Minstrelsy.

THE HUMILIATION OF FELICIA DAUNT.

By ETHEL GODDARD.

Felicia Daunt was the product of a dead age, but, unfortunately, for her peace of mind she had not died with her epoch.

Her childhood had been spent in a sheltered, luxurious home; her girlhood had been a dream of gentle ease, and so she had come softly to womanhood, in the fashion of her day, with no ungraceful effort and without bearing the burden.

Felicia did not marry; she seemed to wish to live simply for her parents, and she was a tender embodiment of the filial virtues of the past. When the well-loved mother was taken from her, she cared for her father with an anxious, absorbing love, regarding him as a being supremely wise, and giving him full gratitude for all his care of her wants. Then when she was about thirty-five her father, too, was taken from her, and a change came over Felicia Daunt's life, for it was made apparent to her that her sheltered days were over, and that owing to the redundancy of her father's debts and the paucity of his assets, she should be obliged to join in the struggle for bread which had always seemed to her a thing remote. Bravely gentle Felicia set forth, armed with her accomplishments, so well adapted to the mental digestion of little girls, and many a wound did she endure in high-bred silence while she worked bravely, and of necessity, in order that she might save a little before the coming of the meagre days. A pitifully small amount it was that she saved, though her best efforts went in the struggle, and though she worked unceasingly for nigh twenty-five years, pitifully small considering the wrench suffered in taking the lower place; but through all those years Felicia was brave.

Then began the birth pangs of the new age, when the standard of feminine attainment was raised; then also began the humiliation of Felicia Daunt. Sensitive, dignified, refined, she felt keenly the scarcely veiled contempt with which the list of her accomplishments now came to be greeted. Yet, of necessity she struggled on, receiving a poorer wage and a scantier courtesy as each year went on, and at last she saw plainly that she was out of date—unwanted by the new-born age. She began to perceive, with a sensitive quickness, that the very woman whose employment agency was such a drain on her slender resources, smiled half-sneeringly when the shabby old lady entered the dusty office and stood meekly waiting for hire. Felicia saw, too, that shorter roads to learning than her well-worn ways were now sought for, that her classic French, her Italian writing, and above all her complete knowledge of deportment, were now things of no effect, and so it came that Felicia Daunt retired to a bare attic and lived in incredible penury, while the advancing age did great things for younger women.

Felicia sat one evening before a rusty grate, in which a mere handful of coals burnt gloomily as if under protest, emitting more smoke than heat in the effort.

The night was bitterly cold—it was December—and Felicia was a pitiful figure as she sat in a stiff comfortless chair, drawing her shawl tightly over her shoulders, and shivering involuntarily as she felt the wind filter through a broken pane in her window. Her hair was snow-white, her face like ivory, but for its myriad furrows, but strength of will and recollection of one of the branches of deportment had prevented Felicia's shoulders acquiring the droop common to depressed old people. Felicia had, indeed, well preserved the great characteristic of her epoch—dignity. It was that quality in her which was potent to abash even the officious "lady inspector" who recommended her to open both her windows, and who was so effusively glad to see "that her room was so nice and clean."

Felicia had just one interest in her life, and it lasted for ten years. Once in each year a vacancy was wont to occur in a Home which kindly charity had provided for destitute old ladies—the wreckage cast up by the new age—and the desire of Felicia's heart was to fill that vacancy and to know once again the joy of a pretty room and a sufficiency of fuel and food. So once a year she timidly approached the busy rector, who looked on her as one of many unfortunate ones, with less interest in her favour than was commanded by most of her class; and Felicia's name was then sent up, with many other names, whereof the result had for nine long years been a postcard curtly recording failure.

On the cold night when Felicia gazed at the handful of embers those failures came vividly before her, for a week before she had made her annual appeal to the rector, and the morrow would tell the result of that appeal. Hope deferred had made Felicia doubt that success could ever be hers. She stretched her thin hands, blue from cold, over the glimmer of the grate; the draught from the broken window seemed to cut her; the door rattled dismally, the cheap candle swilled and smoked; Felicia bowed her head, a dry, wrenching sob escaped her: "If they don't take me in 'twill be too late," she groaned.

Felicia's eyes were dim as she looked at the fast-dying embers, for it is hard to bear the burden of disappointment when the weight of years is great.

When Felicia lay down in bed she wrestled long with wakefulness, wakefulness caused by a cruel, gnawing pain which sometimes made her groan aloud; a pain which she had often endured in those meagre days. Then, at last, she slept, a sleep which she had not known for many years, in which she met the dear and dead in the spiritual atmosphere of the days which were also dead. Felicia never tossed nor stirred that night; she slept calm and still; once a quiver came over her face, but it settled then into a greater peace.

"Miss Daunt! Miss Daunt, ma'am." The bustling landlady was by Felicia's bedside. "Miss Daunt, here's a postcard, an' ye're elected. Holy Father, she's gone, she's gone, an' the good news just kem an' all."

Felicia Daunt was smiling the inscrutable smile. She had finished her fight with the new age.

THE TOURNAMENT.

What time the falchion of the sun
  Clove through the morning mists,
The trumpets blared right merrily,
And two gay knights armed cap-a-pie,
The very flower of chivalry,
  Rode out into the lists.

And one was all bedight with white
  From gleaming helm to greaves;
The other's shield showed golden sheen,
With bars of emerald shot between,
The while his armour glistened green
  As the unfolding leaves.

They splintered couched lance on lance
  Amid applausive cries,
They battled loud with jeer and mock;
Both seemed as firm as is the rock;
And echoes of their conflict-shock
  Went reeling up the skies.

Then suddenly the snowy plume
  Slipped crashing down amain:
The victor heard the plaudits ring;
We saw him back his vizor fling;—
And lo, the triumph smile of Spring
  Above the Winter slain!

WATERFORD CITY.

Its History, Antiquities, &c.

From Lewis's "Topographical Dictionary of Ireland."

In the civil war which commenced in 1641, this city experienced its full share of calamity. At the commencement of that year the city was, without any effort for its defence, surrendered to the son of Lord Mountgarret, and the country around it was laid waste by the insurgents, to whose cause the inhabitants were so attached, that the confederate Catholics had their printing-press here, under the conduct of a man named Bourke. In 1646, the Pope's nuncio, with a view of setting aside the peace which had been concluded between the contending parties, summoned all the R. C. clergy to Waterford, on the ground of an apostolic visitation, and for the purpose of holding a national synod; but so opposed to the measure were the inhabitants, fearing it might compromise the interests of their religion, that when the heralds came from Dublin to proclaim it, no one would show them the mayor's house, nor could they, after three days' stay, obtain from the proper functionaries any other answer than that the peace ought first to have been proclaimed in Kilkenny. In 1649, Cromwell, having surprised Carrick, crossed the Suir to besiege Waterford; and although his army, from the fatigue it had undergone, did not amount to more than 5,000 foot, 2,000 horse, and 500 dragoons, the terror of his approach had such an effect on the citizens, who had refused to accept the troops offered to them by the Marquess of Ormonde, that they sent to consult that nobleman about the conditions on which they should surrender the city. The Marquess, however, assuring them that it rested only with themselves to do their duty and ensure their safety, they gladly accepted a reinforcement of 1,500 men under Gen. Farrel, and began to prepare for their defence. The siege commenced on the 3rd of October; and Ormonde, struggling against desertion and other difficulties, kept together some forces with which he hovered between the city and Clonmel. The city being surrounded with batteries and other fortifications, was thought to be sufficiently defended; and Cromwell, therefore, adopted the plan of a tedious investment as the best mode of attack. On the 23rd, however, he despatched six troops of dragoons and four of horse to the town of Passage, about six miles to the south, and these taking possession of the fort which commanded the river at that place, cut off the communication between Waterford and the entrance of the harbour. The serious inconveniences resulting from the occupation of this post by the enemy, rendered it necessary to make an attempt for its recovery, for which purpose Gen. Farrel marched with some troops, expecting to be assisted from the opposite side of the river by Col. Wogan, of Duncannon Fort. He

was, however, driven back by a strong force suddenly detached against him from Cromwell's army, and would have suffered great loss but for the prompt covering of his retreat by the Marquess of Ormonde with a party of only 50 horse, the citizens having refused any facilities for conducting a larger body over the ferry. After this failure, the Marquess offered to transport his troops from the north to the south side of the Suir, for the purpose of recovering that post and quartering them in huts under the walls, that they might not be burdensome to the city, but receive pay and provisions from the country; but this proposal was also rejected, and it was even moved in the council to seize Ormonde's person, and to attack his troops as enemies. Irritated at their obstinacy and ingratitude, Ormonde withdrew his army, and left the citizens to defend themselves, by their own resources, against the vigorous attacks of Cromwell; their courage giving way, they declared that, unless they received a reinforcement of troops and a supply of provisions, they could make no further resistance. At length when the assault was hourly expected, the Marquess appeared again with his forces on the north side of the Suir, and Cromwell having already lost about 1,000 of his men by sickness and the chances of war, prepared to raise the siege. Ormonde now proposed to cross the river and attack the retreating army in the rear; but the citizens obstinately urged their objections, from an apprehension that the city might become the winter quarters of his army.

Early in the following June, Waterford was again besieged by the parliamentary forces under the command of Gen. Ireton, on whose approach General Preston, then governor, sent to the Marquess of Ormonde to inform him that, unless supplies were immediately forwarded, he should be obliged to surrender; these, however, not being sent, the garrison was soon reduced to the greatest distress. Though the siege was begun early in June, Ireton did not summon the city to surrender till the 25th of July; soon after which the besieged made a sally, but were driven back with loss; and a party of musketeers being sent by the besiegers to burn the suburbs, the smoke being driven by the wind into the city, so terrified the besieged, that they thought the whole army had made an assault, and began to seek safety by the eastern gate. Two brothers named Croker, who led the party that burnt the suburbs, under cover of the smoke which concealed the smallness of their number, scaled the walls and marched forward to the main guard, putting all they met to the sword. The besieged, firmly believing that the whole of Ireton's army had forced their way into the city, were seized with a panic, which enabled this small party to secure all their great guns, and march with them to the western gate, which they opened to their fellow soldiers, who immediately marched in. The citadel still held out, but after a protracted treaty surrendered on the 10th of August, upon terms favourable to the citizens generally, whose persons and property were guaranteed from injury. The violence of the parliamentarian army was chiefly directed against the churches, works of art, and remains of antiquity, not even the tombs of the dead being spared from mutilation. From this period till the year 1656, the old government of the city by mayor and sheriffs was superseded by a government of commissioners appointed by Cromwell, whose most devoted partisans had supreme power in the city. Under these commissioners, orders were issued prohibiting Catholics from trading within or without doors; high courts of justice were instituted here as in other cities, for the trial of persons concerned in the massacre of 1641; and under this usurped authority the public buildings, quays, streets, roads, and other works were generally improved. Col. Lawrence, the first governor under the parliament, was succeeded in that office by Col. Leigh, to whom and to the justices of the peace the lord-deputy and council issued an order to apprehend forthwith all Quakers resorting to that city, and to ship them either from that port or from Passage, to Bristol, to be committed to the care of that city. On the restoration, Richard Power was appointed governor of the county and city of Waterford; and on the revival of the corporation, the inhabitants petitioned the Duke of Ormonde to be admitted to the enjoyment of the franchise, notwithstanding religious differences; but so far from obtaining this object, it was ordered by the lord-lieutenant and council, in 1678, that, with the exception of some merchants, artificers, and others, they should be expelled from the city, though many were re-admitted. During the interval of peace from 1664 to 1681, the trade of the port continued to increase rapidly; the duties paid at the custom-house, at the former period, amounted to £7,044, and at the latter to £14,826.

SEAL.

Jas. II., on the day after the battle of the Boyne, arrived at this place, and immediately embarked for France in a ship which lay in the harbour ready to receive him. On the 20th July, Major-Gen. Kirk advanced with a body of forces from Carrick, and sent a trumpeter to the city to summon the garrison to surrender; this was first refused in mild terms, but soon after, the citizens sent to know the terms that would be granted, which, being the same as those offered to the garrison of Drogheda, were rejected. The garrison then demanded the enjoyment of their estates, the freedom of their religion, and liberty to march out with their arms and baggage, which being refused, preparations were made for a regular siege; but on the 25th the garrison was allowed to march out with arms and baggage, and was conveyed to Mallow. On the following day King William entered the city, and took measures to prevent the property of any person from being damaged; on his return from the siege of Limerick, he embarked at this port, on the 5th of September, for England. At the close of this century the city is represented as being in a wretched condition; the houses in ruin, the streets filthy and uneven, and the roads extremely bad; but, under the management of successive mayors, it was greatly improved both in comfort and appearance early in the following century. In 1732, a tumultous assembly rose to prevent the exportation of corn; another riotous meeting, occasioned by the scarcity of provisions, took place in 1744, when the military were called to suppress the riot, and several lives were lost. In the disturbances of 1798 the citizens took no part: several meetings of the United Irishmen were held here, but the peace of the city was preserved by the victory obtained over the insurgents at Ross.

The city is beautifully situated on the southern bank of the Suir, about 16 miles from its influx into the sea: it extends principally along the margin of the river, having an elevation very little above high-water mark, except at the western extremity, where are some more gentle elevations: on the south, bordering on the stream called John's river, which here falls into the Suir, is a large tract of level, marshy land stretching towards Tramore. Near the Western extremity of the city, and connecting it with the small suburb of Ferrybank in the county of Kilkenny, is a bridge of wood, 832 feet in length and and 40 in breadth, supported on stone abutments and 40 sets of piers of oak, undertaken by a company incorporated in 1793, who subscribed £30,000 in shares of £100 each, and erected by Mr. Cox, a native of Boston, at an expense so much below the estimated cost, that £90 only was paid on each share of £100, which now sells for £170: it was begun April 30th, 1793, and opened Jan. 18th, 1794: the company have a sinking fund for the repair or rebuilding of the bridge, if necessary, and the tolls are let for about £4,000 per annum. Over John's river, which skirts the city on the east and south-east, are two ancient bridges, called respectively John's bridge and William-street bridge; and one of modern erection called Catherine's bridge, from the ancient abbey of St. Catherine, near which it is situated. On the opposite side of the Suir are some lofty hills, from which the city is seen to great advantage, having in front the river and the splendid quay extending from the bridge to the mouth of John's river, one mile in length, with scarcely any interruption, and forming a remarkably fine promenade. The quay was enlarged in 1705, by throwing down the city walls on this side, with one of the gates, which, with the great ditch, formerly divided it into

two portions. The houses, though irregular in their style of architecture, form a range of buildings of lofty and imposing appearance, among which the ancient tower built by Reginald the Dane, and now occupied as a police barrack, is a conspicuous object. In front of these buildings are a broad flagged footway and a Macadamised road; and the part along the margin of the river is separated from these and forms a beautiful promenade.

This place has never been much distinguished for its manufacture; it had once some celebrity for the weaving of a narrow woollen stuff, which was in great demand in every part of Ireland, and was also exported in considerable quantities; but of this trade and also of the hall in which the article was sold, there are now not the smallest remains. There were also manufactories for salt, smoked sprats; japanned wares of various descriptions, established here by Thomas Wyse, Esq.; and for linen and linen thread, which latter was celebrated all over Ireland, established here by a family named Smith, who brought with them a number of workmen from the north of Ireland; but all these have successively failed, as has also a glass bottle manufactory, which was established opposite to Ballycarvet. A glass manufactory of superior description was, however, established in 1785, and is now conducted by Messrs. Gatchell and Co., who have a considerable export trade, particularly to America: in this establishment about 70 persons are employed. There is a starch and blue manufactory, also two iron foundries: and till within the last few years there was an extensive manufacture of glue, of which considerable quantities were sent to England. There is a small establishment for rectifying spirits; and public breweries have been established and brought to such perfection as to supersede the necessity of any importation from England; they are conducted upon a scale affording the means of a considerable export of beer to Newfoundland, and lately to England, which trade is progressively increasing. But it is to its commerce, promoted by the favourable situation of its port, that Waterford is principally indebted for its importance, and for which it has been distinguished from a very early period. The liberal policy, adopted in 1704 and 1705, of admitting to the freedom of the city foreign traders of all descriptions, induced several merchants from Italy, Spain, France, Portugal, Holland, and other counties to settle there. Before agriculture became so extensive as it is at present, the principal trade was the exportation of beef, hides, and skins, not only to the English settlements but to several ports of Spain; cheese, also, of an inferior quality, called "Mullahawn," was exported in considerable quantities, and an extensive trade was carried on with Newfoundland. Notwithstanding the extent of its export trade and the importation in return of foreign produce of every kind, the merchants and traders until recently have not invested much property in shipping of their own, but have chiefly employed English shipping; and even till the year 1820, the port was considered one of the worst in Ireland, in respect of the accommodation it afforded for repairing ships. This disadvantage has at length been removed by the construction of a dockyard on the bank of the river, opposite to the city, into which vessels of any burden may be drawn completely out of the water for repair, and in which have been built several vessels that are much admired for beauty of model and soundness of workmanship. The trade of the port has been much promoted by the establishment of a Chamber of Commerce, incorporated by act of parliament in 1815.

(To be Continued.)

REAL GIANTS.

Dr. Thomas Wilson, curator of the department of pre-historic anthropology of the Smithsonian Institution, has completed a very interesting investigation of the causes that produce giants, and is writing a similar paper on the subject of giants, ancient and modern. The study was brought about by continual inquiries of people in different parts of the country in regard to giants. There is very little precise scientific information on the subject, and not until within the last few years has it been looked into at all by ethnologists or physiologists. Professor Wilson says that the giants of nursery tales excite the admiration and the fear of the infantile population, for they are described as bold, cruel, and voracious. As a matter of fact, giants are generally weak physically, good-natured personally, and not over intelligent. They are often inactive and feeble, but rarely evil-minded.

Professor Wilson speaks of the mythical giants of the golden age and the accounts of them given by Homer and Hesoid. Homer wrote about 900 B.C., and Hesiod about 600 B.C. They concerned themselves in that day, as many brilliant theorists do at the present time, in imagining the birth of the world and the origin of man. They described the giant gods and goddesses engaged in the laudable occupation of starting the infant world and peopling it with beings of great strength and stature and beauty of form, who were the representatives, if not the progenitors, of all the virtues and some of the vices that belong to mankind. It is not, however, until we come to the giants of mediaeval times that there is any information which has the semblance of verity, and even here there are large discrepancies. Professor Wilson has studied at some length the various authorities, and has made a list of the best known giants of mediaeval and modern times, which he has arranged, chronologically thus:—

Name.	Date.	Height. Feet.
Evans	1632	8
Mellon	1665-1684	7.6
Miller	1674-1734	8
Blacker	1724	7.4
Cornelius McGrath	1737-1760	7.8
O'Brien	1760-1783	8.4
Murphy	1761-1783	8.10
Cottar	1802	8.7
Bradley	1798-1820	7.8
Eleizigue		7.10
Hale	1820-1862	7.6
Louis		7.4
Loushkin		8.5
Chang		8.2
Anak	1840-1865	7.8
Peruvian giant (died at New York, 1893; real height 6.9 feet)		7.6
Minnesota giant		7.4
Marianne Wehde (Ranke)		8.4½
Austrian giant (Topinard)		8.4½
Winkelmeyr (Doubes)		8.6

Professor Wilson relates an experience he had in Louisville with a giant that shows the common tendency towards exaggeration.

Along in the '50's a Nova Scotia giant was exhibited there. He was brought upon the stage before an audience, of which Professor Wilson was a member, by the manager, who gave an eloquent description of him, dilating upon his great size and strength, and intimating that his stature was not less than 7 feet 8 inches. But the giant was not received with very high favour, for the crowd adhered to their favourite, Jim Porter, known as the Kentucky giant. Porter, who had evidently been advised of the opposition, was present He was called upon and stood up by the side of the exhibiting Nova Scotia giant. Cheers went up from the audience when it was seen that he was the taller of the two, and the stage was soon filled with people clamouring for a measurement. Professor Wilson had a small ivory pocket rule with him. He brought out his rule and was mounted upon the table, and he pronounced Porter to be three inches and a half taller than the Nova Scotian. Porter was very proud, and in proportion as he manifested his satisfaction so was the contrary sentiment shown on the face of the Nova Scotian, who finally slunk away out a back door. The Nova Scotian was 7 feet 4 inches tall, but Jim Porter was 7 feet 7½. Jim's rifle, which he was proud of showing, was as long as an average man is tall. His walking stick came to the armpit of an ordinary man, and his chair was as high as a table.

Another case of interest was investigated by Professor Wilson more recently and proved, like many others, to be a fake. This was a giant mummy which was being exhibited for gain. It was laid upon its back in a box intended to represent a coffin, though it had a greater resemblance to the large watering troughs common at roadsides in the country. The coffin was about 10 feet long, 2½ feet wide, and 2½ feet deep, and was covered with glass. Professor Wilson laid his rule outside the glass and found the body to be 8 feet 4 inches in length. It had every appearance of being genuine, and the skeleton had the appearance of a well-formed man with members in not unusual proportions. The mummy was at the bottom of the coffin, under glass, and no one was allowed to touch, feel, or weigh it. Although there was no opportunity to test the bones, skin, hair, nails, or other parts by the microscope or other method, the belief was general that it was genuine. Later it was found that the thing was a fake, and had been manufactured with many others for exhibition for money.

GEORGE FAULKNER.

(From the "Dublin Penny Journal," 1832.)

When Foote was acting in Dublin, he introduced into one of his pieces, called the Orators, the character of George Faulkner, the celebrated printer, whose manners and dress he so closely imitated, that the poor fellow could not appear in public, without meeting with the scoffs and jeers of the very boys of the streets. Enraged at the ridicule thus brought upon him, Faulkner one evening treated to the seat of the gods all the devils of the printing office, for the express purpose of their hissing and hooting Foote off the stage. Faulkner placed himself in the pit to enjoy the actor's degradation; but when the objectionable scene came on, the unfortunate printer was excessively chagrined to find, that so far from a groan or a hiss being heard, his gallery friends partook of the comical laugh. The next morning he arraigned his inky conclave, inveighed against them for having neglected his injunctions, and on demanding some reason for their treachery, was lacerated ten times deeper by the simplicity of their answer: "Arrah, master," said the spokesman, "do not be after tipping us your blarney: do you think we did not know you? Sure 'twas your own sweet self that was on the stage, and shower light upon us, if we go to the playhouse to hiss our own worthy master."

Failing in this experiment, Faulkner commenced an action against Foote, and got a verdict of damage to the amount of three hundred pounds. This drove Foote back to England, where he resumed his mimicry, and humorously took off the lawyers at his trial, and the judge who had condemned him.

LITERARY NOTES.

Mr. Herbert Spencer proposes shortly to issue a new volume entitled "Facts and Comments." It will make a volume of 200 pages.

✧ ✧ ✧

The official life of Lord Beaconsfield has not yet, we believe, been assigned to any writer. Lord Rowton, with whom the matter rests, still delays. Meanwhile, an offer has lately been made to a well-known journalist and student of Lord Beaconsfield's works and career to write a popular life.

✧ ✧ ✧

The end of the great task of writing the "Life of Gladstone," and of examining the library of documents and letters, to which Mr. John Morley has devoted some years of his life, is in sight. It is hoped that the three volumes, which have been found necessary in order to include all the material, will be published next autumn.

✧ ✧ ✧

Paul Bourget dedicates the title story of his latest book, "Monica and Other Stories," to Edith Wharton. Mrs. Wharton dedicates "The Valley of Decision" to "Paul and Minnie Bourget in memory of Italian days together." An American journal, commenting on the interchange of dedications, calls it Literary Ping Pong.

✧ ✧ ✧

In Kalidasa's "Sakuntala"—the translation of the old-time Indian play which Mr. Walter Scott will issue next week—the charm lies in its simplicity and the ardent love of nature which permeates the whole work. The character of "Sakuntala" is especially beautifully drawn, and in this respect the drama of India resembles our own—in that the plays portray character rather than point to moral.

✧ ✧ ✧

Lord Windsor and Sir Herbert Maxwell have both consented to contribute to the new and important art publications which the Walter Scott Publishing Company are designing under the title, "Makers of British Art." Lord Windsor has selected "John Constable" as the subject of his volume in his series of illustrated monographs, while Sir Herbert Maxwell will write on "George Romney." Professor Bayne is also engaged on a volume on "David Wilkie."

✧ ✧ ✧

The announcement that Mr. John Murray will publish in the autumn "a new work by John Milton" has naturally aroused considerable interest. The Rev. Walter Begley, the finder of "Nova Solymo: The Ideal City of Zion, or Jerusalem Regained," has no doubt of the authenticity of his discovery. It is in prose and verse, and is supposed to have been begun by Milton when a student at College. "Nova Solyma" will be issued in two volumes with a long introduction by Mr. Begley.

✧ ✧ ✧

Ralph Waldo Emerson died on April 27th, 1832. He came of a long line of educated ministers, and his mother was a gifted and refined woman. His father died when Ralph was but six years old, leaving his family very ill-provided. At eight he went to the grammar-school, where he began to read the classics and write poetry. After leaving Harvard he became a schoolmaster, and in 1826 he took to preaching, but, in consequence of his unorthodox views, he felt bound to leave the pulpit, and became a lecturer and essayist. He came to Europe in 1833, and sought out Carlyle at Craigenputtock. Thereafter, for forty years, they corresponded, and each did his best to make known in his own country the works of the other. In 1836 "Nature" was published, and this was followed by other volumes of essays and poems.

✧ ✧ ✧

The present Poet Laureate is following in the footsteps of the last, and cultivating the acquaintance of the colonial bard. Lord Tennyson's friendship with Sir Henry Parkes and the good-natured things he wrote about the occasionally appalling verses of that leading Australian statesman will recur to memory. A collection of poems has just been published in Melbourne, under the title of "Musings in Melody." In accepting the dedication, Mr. Alfred Austin wrote:—"It will give me much pleasure to find myself associated with your new volume, and I shall regard it as an agreeable and significant link between the higher culture of Australia and the literature of the Motherland." The Poet Laureate has domestic ties with Australia. A brother has long followed the prosaic, but profitable, pursuit of a share-broker in Sydney.

✧ ✧ ✧

"The Book of the Month," in Mr. Denvir's Irish Library, is a biography of John Boyle O'Reilly, by Mr. Wm. J. Ryan. The sketch does not run to more than twenty pages or so, yet within the necessarily brief space at his disposal, Mr. Ryan succeeds in presenting his readers with an admirable pen-portrait of Boyle O'Reilly. The little book is, in fact, a marvel of compression. It is also written in a style which suggests that Mr. Ryan, though yielding to none in his admiration of O'Reilly's career, is yet able to place his opinions on this subject before the public in such a way as not to give the slightest degree of offence to those who disagree with him. Altogether we should say that this brochure fulfils in the highest degree the best conception of what a popular biography should be. On the Gaelic page of the "Book of the Month" is a spirited song by Mr. T. D. Sullivan, to the air of "The West's Awake."

✧✧✧

Dr. Robertson Nicoll concludes his interesting introduction to "Jane Eyre," the first volume in Messrs. Hodder and Stoughton's intended complete edition of Charlotte Bronte's works, with the following remarks—"Very few can compare with Charlotte Bronte in the art of expression, but she owns no master. She is one great example of the truth that style is not the result of reading, but of thinking. As Mr. Morley has said—'It is not the assiduous cultivation of style as such, but the cultivation of the intellect and feeling which produces good writing. Style comes of brooding over ideas, not over words.' Not that she neglected words. She constantly studied their effect—chose and rejected them after much consideration. But her main business was to string them as on an electric chain." As Dr. Nicoll is writing on style, he will pardon us for objecting to his last sentence, in which we fancy he has momentarily brooded over words rather than ideas.

✧ ✧ ✧

A proposed feature of the St. Louis World's Exposition will be an exact reproduction of the birth-homes of two or three British writers. The suggestion is that exact facsimiles of the buildings and the chief historic relics they contain shall be made. These will be rebuilt in permanent form so that they may remain in Forest Park, St. Louis, after the less stable portions of the World's Fair have done their duty and disappeared. It is proposed to re-create at St. Louis the "Auld Clay Buggin," the cottage under the thatch of which Robert Burns was born on the 25th of January, 1759. It is of clay, with a sanded front, whitewashed, and was built mainly by the hands of the poet's father while he was working as a gardner. The house, as all pilgrims to Ayr know, is one storey high, and consists of a kitchen at one end and a best parlour at the other. In the latter is a fireplace, and in a niche by its side is a bed. In the opinion of the old wives of the town—

> The bed in which he first began
> To be that various thing called man

was in the tiny kitchen. Replicas of the bed and of the other important items in the little white house in Ayr are included in the St. Louis scheme.

✧ ✧ ✧

Mr. Quiller-Couch has been talking about novels and things in his study at Fowey to Mr. Harold Begbie, who tells us in the "Daily Mail" what he said. He was perhaps most entertaining in answer to Mr. Begbie's question: "How is it that the new books which have most shocked the public mind have been written by women?" To this "Q." replied that the modern lady novelist declares that all subjects may be treated by art, because, she says, art is truth. Which of course it is not. "Art is not truth; it is truth reflected through beauty. Women," continued the interviewee, "think of no other subject than what they call the sex problem"—proceeding:—

So far they are within their rights. Passion is everything to a woman; it isn't to a man. They regard marriage as an institution forced upon them in their slavery by the brute force of a man, and so they gird at it in their books; and to make it appear as cruel and wicked as possible they indulge the—what shall we call it?—well, the curiosity of repulsion.

"They are like Plato's man beyond the city walls, who shut his eyes naturally when he came to a field of corpses, and then, feeling that he must conquer this weakness, went back and looked upon the hideous sight by forcing open his eyelids with courageous fingers." He smiled. "They regard man as a horrid nuisance; as an impediment in their path. One of them at least—poor, dear lady!—wishes that babies descended like manna out of heaven. But man is a stone wall against which they must butt in vain. People who think that one sex can do without the other want a shampoo."

✧✧✧

But that women should out-Zola Zola, said Mr. Begbie, is an unpleasant reflection.

"Women have always done that sort of thing," answered "Q.," filling a fresh pipe. "It is a means of attracting attention. But we must remember that George Eliot shocked public opinion; that poor little Charlotte Bronte was regarded as a shade indelicate; and that Ouida"—he laughed—"was considered quite improper. The present school came in when Flaubert, Daudet, and Zola were being talked about, and just when the Russians—an infinitely greater school—were appearing upon the horizon. To go one better than Zola was obviously their best means of attracting attention."

Then they lighted up, and went down to the yacht club, "Q" remarking: "The lady novelist is a dear creature, but tiresome." This lets her down gently at the last. But did the sun (says the "Academy") at this moment, really—really—"burst suddenly from behind the grey clouds, flooding the Fowey with silver light"?

✧ ✧ ✧

The old soreness between the Northern and the Southern States appears to be reviving in a curious form. The South considers that literature has been forced upon it by the North, which in no way represents its aspirations and ideals. Therefore, with a fine air of getting at the root of the matter, the South proposes to establish a vast book manufactory and publishing house, with a capital of five million dollars. The chairman of the general committee has delivered himself as follows:—

> Southern men will no longer delegate the moulding of thought and education to those who have for fifty years persistently, even cruelly, ignored the desires and interests of Southern people. During all of these years, in which these concerns have been callous to appeals and threats alike, the South has suffered injuries that are beyond possible excuse or pardon. Millions of money have been taken for books that were often offensive to the people.

Again he says:—

> In the direct matter of text-books for schools, the South is in bondage, practically. The present generation is, if anything, more servile to text-books than its predecessor. The books used relate so little of the South that, like unlettered races, our real story is mere tradition, handed down from father to son and mother to daughter.

Naturally this scheme is not viewed with kindness by the Northern Press; one paper goes so far as to say that "there is no such thing as 'Southern Literature.'" But that is the trouble, and the Quixotic corporation in question proposes, with the aid of its five million dollars, to supply the need. We are evidently rapidly approaching, the "Academy" remarks, the time when it shall be said, as of Nature, Literature abhors a vacuum.

SCIENTIFIC TOPICS.

Canon Ellacombe, like Dean Hole, is devoted to gardening, and an attractive writer on that attractive subject. He has just coming out with Mr. Lane a book which is a sequel to his "In a Gloucestershire Garden." It consists of papers that he has wirtten from time to time in the "Guardian," the "Pilot," and the "Gardener's Magazine." He dates it from Bitton Vicarage, where he lives, and calls it "In my Vicarage Garden and Elsewhere." The papers indicated by the latter part of the title refer to travel and literary topics.

✧ ✧ ✧

It has been remarked more than once as singular that no mention of the crocus is to be found in Shakespeare. Yet it is known for a fact that this spring flower did exist in England in Shakespeare's time, because Gerard, a contemporary of his, describes it. "That pleasant plant," he says of the crocus, "was sent unto me from Robinus, of Paris, that painful and most curious searcher of simples"; and he describes it elsewhere as having "flowers of a most perfect shining yellow colour, seeming afar off to be a hot glowing coal of fire."

✧✧✧

Paris is the centre of an international telephone wire net; its extreme ends are London, Hamburg, Berlin, and (in connection with the French-Italian line about to be opened) Turin and Milan. The Paris-Berlin line is the longest, with about 625 miles of wire. The Paris-Hamburg line is about the same. The distance from Paris to Turin, measured by an air line, is about 375 miles, and that between Paris and Milan about 470 miles. But all these lines are eclipsed in length by that between Paris and Cologne, not by the direct line, but by indirect connection, often rendered necessary by breaks in the other service. In such cases, a person in Paris desiring to speak to Cologne is connected via Berlin. This roundabout way increases the wire distance about 375 miles, making the total about 1,000 miles. The "Cologne Gazette" states that this does not impair the distinctness of the message, and no loss of time is noted in using this increased distance.

✧ ✧ ✧

No sailing vessels have crossed the Suez Canal since 1874 or 1875, except during the time of the Turko-Russian war of 1877-78. At that time sailing vessels arrived from Calcutta with Indian troops; but for the last ten years no sea-going sailing vessel has crossed the Canal. Sometimes trains of coal and materials, treated by the Suez Canal Company as sailing vessels, with the object of collecting the towing duties, have crossed the Canal, but no sailing vessel engaged in high sea navigation has crossed it within the period named. The absence of sailing vessels in the Canal is explained by the difficulties of navigation in the Red Sea. The extraordinary number of sailing vessels lost in the Red Sea (which is full of dangerous reefs and shoals) during the years 1872-73 seems to have effectually discouraged further attempts. The officials of the Suez Canal Company believe that the construction of the Canal, which was opened to navigation in 1869, has been an impetus to steam navigation throughout the world.

✧✧✧

The hydraulic plant of Vizzola, which already distributes more than 15,000 horse power for lighting, traction and electrolytic industries is the most important installation which has been made in Italy up to the present time. The abundant waters of the Tessin, from the point where it leaves the Lago Magiore to its confluence with the Po, were long used for irrigation, but until recently no attempt had been made to utilise their fall, which is considerable, for the production of light and power. A project had been set on foot as early as 1896 in connection with the Villoresi irrigation canal which provided for utilising about 40,000 horse power, and in 1896 the Italian company obtained an authorisation from the government which would allow of the development of this project and give them a fall of 75 to 90 feet. In the winter of 1898 the work upon the hydraulic installation was begun by the Lombard company and their great undertaking was brought to a successful end after more than a year's work.

✧✧✧

Several severe experiments have recently been made in Christiana with a new electro-magnetic gun invented by Prof. Birkeland. The electric connection between the battery and the gun is made in less than a second by the aid of a current breaker. The feature of this weapon is that no noise accompanies the firing. In the trials the electric spark was first seen, followed by a loud report, which was caused by the impact of the projectile, a one-pound shell, on a wooden target, which was penetrated. The gun works magnetically. The shell is drawn out of the bore, and not, as hitherto, impelled by gunpowder. The use of magnetism as a motive power, according to Prof. Birkeland, will enable 1,000-pound shells to be hurled much further than by the old-fashioned methods. This is by no means the first gun with which attempts have been made to fire shells by magnetic means, but no electro-magnetic gun has yet succeeded in fulfilling the requirements which were claimed for it, so that Prof. Birkeland's further experiments will be followed with greater interest.

✧ ✧ ✧

A scientist who discovers a new chemical element, a planet that has managed to elude the searching telescope, or a plant or animal unknown to the world, has the right to name the object discovered. To be sure the privilege is merited, but what racking of brains it often entails was recently proven by the difficulty which Charlois of Nice experienced in baptising the thirty-four planetoids which he had discovered. When Piazzi on New Year's Day of the nineteenth century saw the first of these small planets, it was easy enough to follow the old rule of giving to celestial bodies the names of the Greek and Roman deities. For a long time the catalogue of mythological personages was quite capable of supplying the necessary names. But when celestial photography relieved the astronomer of much of the labour of telescopic observation, and the planetoids began to be numbered by hundreds, the list of mythological names was soon exhausted. Following the example of the Romans, Charlois personified the virtues, and thus created Amicitia, Fiducia, Modestia, Gratia, and Patientia. When he had no more virtues to fall back upon, he started with the city gods of those towns in which observatories are located, and was finally compelled to adopt proper names such as Ursula, Cornelia, Malusina.

✧ ✧ ✧

When it becomes necessary to rechristen a botanical species which has been divided into several new species because later research proves it to be heterogeneous, and which bears the names of its discoverer, baptising becomes a rather puzzling matter. Out of scientific piety the later investigator must give the first discoverer credit, and yet he must do himself justice. In such a case anagrams are sometimes formed. From the species Hermannia, for example, discovered by Paul Hermann, a small group is separated and called Mahernia; and the species Malpighi, named for a famous old botanist, supplied the species Galphimia—a name which would deceive the most skilled etymologist who tried to trace its derivation without knowing is antecedents. Often by some capricious accident an anagram receives a Greek tone. Urobenus, for example, conceals the name of the botanist Bourne (Bournerus). Cassini used the anagrammatic method, not for reasons of scientific piety, but merely because he liked it. From the old species of Filago he created four new species, which he called Logfia, Gifola, Iglofa, and Ogilfa.

✧✧✧

Ever since the opening of her first underground railway, in 1863, London has been confronted with the serious problem of tunnel ventilation. All sorts of plans have been tried, but the air is still far from satisfactory, and is a menace to health. The directors of the Central London Railway are now taking expert advice on the matter. The subject has, however, already been thoroughly investigated by a Board of Trade committee which sat in 1897. After examining a large number of experts they came to the conclusion that the tunnel could be properly ventilated by the use of fans placed at intermediate points between the stations, but that the expense entailed would be great. According to the plan, shafts would have to be sunk midway between each two stations to act as outlets for the air, the stations and their approaches acting as inlets. In order to properly diffuse the impure air it would be necessary to carry the shafts as high as the neighbouring buildings. The fans used would have to be large and open, so that they could be revolved slowly, and thus rapidly change the whole air in the tunnel without causing a strong draft. At the same time, the disagreeable vibration caused by rapidly-moving machinery would be avoided, and the power expended would be reduced to a minimum. The fans proposed would change the air in the tunnel in about two and a half minutes, which is about the time it takes a train to pass between stations. Fresh air would thus be kept constantly flowing through each section of the tunnel at the rate of three miles an hour. This method was the cheapest of all proposed, the power of driving each fan by electric motors being conveniently available.

✧ ✧ ✧

The British Government has just completed the survey of the English section of the Victoria Nyanza, in central Africa, for the establishment of a steamer service on the lake in connection with the Uganda Railway, which has recently been completed. The surveying has occupied thirteen months, and was carried out by two surveyors in two small steel boats. Every part of the British shore of the Nyanza was explored, aggregating over 2,200 miles of coast line, mainland, and islands. The latter have been accurately charted for the first time, and in parts the maps of the lake shore have been altered from their existent physical condition. The lake is studded with a very large number of islands of varying sizes, many of them densely populated. The British portion of the lake is about 135 miles from east to west, and about 90 from the north to the Anglo-German boundary, excluding the eastern gulf, 40 miles long, which has now been properly mapped. The lake is constantly subject to storms, which render it dangerous to navigation. Owing to this fact, and the smallness of the boats, it was not thought advisable to visit three small islands which were visible far out in the lake, but with these exceptions every island has been visited and mapped by the expedition. During the journey the surveyors discovered several islands inhabited by savages. Even some of the tiniest rocky islets were found to be tenanted by fishermen. Preparations are being made for the development of the lake traffic with the opening of the railway, and passengers leaving the train at Port Florence, on the lake shore terminus of the railroad, will step on board twin-screw steamers alongside the jetty, which will convey them to the different stations. One of the steamers for this service has already left England, and should be on the lake by June. Another steamer will follow. These vessels are each 175 feet in length and draw six feet of water.

GLIMPSES OF THE PAST.

From the Dublin Newspapers of 1793.

Extract of a Letter from Mullingar, dated September 3rd, 1793.

"Yesterday the Prince of Wales's regiment of Longford militia, commanded by the Earl of Granard, marched into this town, on the route to Kilkenny, about five miles distant from the town; the whole regiment, with a great concourse of the neighbouring people, were most hospitably entertained at Clanhugh-lodge, his lordship's country residence in Westmeath; the united elegance and profusion of the board; his lordship's politeness, affability, and cordial reception; the animated cheerfulness of the men after a fatiguing march of fifteen miles in a heavy and incessant rain; their reiterated bursts of attachment to their commander after leaving their own country; and the heartfelt satisfaction of the spectators, all contributed to form a scene interesting beyond my powers of description.

"The order and regularity of the march was not less flattering to his lordship and the officers who serve under him; the steadiness of the troops, and their exact attachment to military discipline, notwithstanding their fatigue, did them the highest honour, and excited the admiration of a vast crowd who had assembled on the occasion, attracted, no doubt, by the well-merited reputation this regiment has acquired. Among the spectators were some veteran officers, who repeatedly testified their astonishment, and assured me they had hitherto conceived it impossible to form a regiment to such exact discipline in so short a time. But, as a friend to this country, I have peculiar pleasure in declaring, from my own knowledge, that not a single murmur of discontent was heard during the whole march; one unanimous sentiment of affection to the noble earl who commanded them, of attachment to the illustrious Prince who honours them with his protection, and of devoted loyalty and duty to their Sovereign, pervaded the whole ranks, and extended itself to many spirited fellows who had followed the regiment, in hopes that some accident on the march might possibly occasion a vacancy for their admission."

September 25.—The young man who fell into the mashing kieve on Saturday last at a distillery in Mary's lane, leading from Church street, died next morning in the most excruciating agonies. He was standing on a board placed across the kieve, in order to pump water into the same, the contents of which were furiously boiling, when he unfortunately slipped in. At the time of his being taken out, which was in about two minutes after the fall, he called to his father, who worked in the same place, "to plunge a knife into his breast and put an end to his torments." It is unnecessary to mention the feelings of the parent on the trying occasion. The youth was about 19, and the only son.

On the night of the 18th inst., as Mr. Redmond M'Donough, of Beagh, near Headford, was returning home from the fair of Turlough, he fell from his horse, and was killed on the spot.

October.—There has lately been discovered near the harbour of Rutland a large ship, sunk about three feet below the surface of the water at low tide. Four brass cannons have been got up from the wreck; and from the marks on them it is believed to be one of the vessels of the famous Spanish Armada, many of which, acording to history, were lost on the western coast of Ireland.

October 1.—Yesterday Alderman Wm. James was sworn into office at the Castle, and invested with the insignia of the important office of Lord Mayor for the ensuing year, after which he proceeded to the Tholsel, where Meredith Jenkin and John Giffard, Esqs., were sworn into office as High Sheriffs, and Arthur Guinness, Esq., Sub-Sheriff for the same period.

In the evening his Excellency, and several persons of distinction, dined at the Mayoralty House, where a sumptuous entertainment, abundant in every delicacy, was provided.

The Lord Mayor's liveries, as also the Sheriff's, are white lined with scarlet, most rishly and fully laced with scarlet and white livery lace, gilt buttons, with a profusion of silk tassels, and gold laced hats; and the four grooms of the chambers are dressed in fine purple blue cloth, richly laced with gold.

The Lord Mayor's coach is bright green, highly varnished, richly ornamented with plated work, with the heraldry handsomely emblazoned on the front, back, and side doors; the lining and hammer cloth white, highly adorned with scarlet and white silk lace and fringe. The carriage is dark green, pinked in with sky blue, orange, and white, and wreathed with gilt ribbon work, the supports of the boot and footmans' stand elegantly carved and gilt.

Sheriff Jenkin's chariot is dark chocolate colour, with much plated work, the arms plain and small; the hammer cloth the same as the Lord Mayor's; the carriage and wheels full green, picked in with orange and blue, and painted ribbon work.

Sheriff Giffard's chariot is pearl blue; the carriage and wheels dark brown, picked in with orange, blue, and white.

At a post-hall of the guild of merchants, held yesterday at the Exhibition-house, for electing masters and wardens for the ensuing year, Joseph Dickenson, Esq., of Usher's quay, was elected senior master; Jeremiah D'Olier, Esq., of Dame street, junior master; and Mr. William Lindsey, of Parliament street, and Mr. Robert Powell, of Thomas street, wardens.

On casting up the ballot for wardens, the numbers stood as follow:—

For Mr. Robert Powell ...	...	92
Mr. William Lindsey	...	88
Mr. Henry Clements	...	78
Mr. Hugh Skeys ...	...	76

Yesterday, being quarter day of the Corporation of Shoemakers, the petition of four respectable Roman Catholics, deferred to that time from the preceding quarter day for admission to the body as free brothers, were rejected by ballot. The petitioners were Messrs. Hughes, Langan, Mulvey, and Mullen. Mr. A. Loughlin, who petitioned for admission by service, was likewise rejected by a majority.

October 4.—Yesterday, being quarter day of the Corporation of Apothecaries, Mr. Thompson, of Stephen street, and Mr. Dwyer, of St. Andrew street (both Roman Catholics), were admitted to the freedom of that Corporation.

On Saturday evening a deputation of two senior and junior Fellows of Trinity College sailed for England, to wait on his Majesty with a representation from the learned seminary of the evils likely to result to literature and education from the appointment of aliens to the government of the College, the only authorised place of public education in the kingdom. And humbly entreating his Majesty, out of paternal goodness to his people, that when he shall hereafter be pleased to appoint a Provost to the College, he will condescend to confine his regards to those who are at present, or who have been Members of the Society; and who must, consequently, be well acquainted with its modes of instruction, its institution, and its discipline.

A few days ago the labourers in throwing up a fosse round the new church of Kilbery, in the Co. Westmeath, now building by the Right Hon. Lord Sunderlan, discovered a subterraneous passage, and on following it by his lordship's directions, they came to a number of cells, some oval and others circular, from 18 to 6 feet diameter, with small arched entrances from one to another.

These cells are of rude masonry, with small horizontal funnels from each, supposed to admit air; the use of these we are at a loss to judge of; they now cover over a quarter of an acre of ground, and new discoveries are making every day.

On Friday and Saturday some of the Clontarf men went in pursuit of seals to Howth; they swam into the caves with lights, where the dams bring forth their young. After a severe conflict, wherein the men were much torn, they were so fortunate as to take three large ones, and would have got four cubs, but were so fatigued and assaulted by a number of large seals, that they were obliged to make a precipitate retreat. The monsters are so extraordinary a sight, that numbers of people have resorted to examine them at Clontarf, where they are near the wharf.

Christmas Weeks, Esq., and Mr. Anderson, of Clontarf, were amusing themselves sailing in a small boat in Poolbeg on Monday last, when a Wexford sloop ran them down. They continued in the water for near a quarter of an hour. Mr. Weeks was picked up by the wherry of the Clermont packet, which was conveying down bread. Mr. Anderson, nearly exhausted, was taken up in a small boat, and carried to the Pigeon House.

October 17.—On Friday morning last a duel was fought near Newry, between Mr. E. Courtney and Mr. J. Thompson, two young gentlemen of that town; they fired at the same instant, and the ball of the former entered the forehead of the latter, rather obliquely, a little above the left eye; he lingered till about 11 o'clock at night, and expired.

An incision was made upon the place where the ball entered, and about one-third of it was found upon the bone depressed (which had split the ball), the remainder, upon examination after death, was found in the brain, about four inches from where it entered.

The navigation from the city of Limerick to O'Brien's Bridge was opened on Saturday se'nnight. This opens a source which must overturn the schemes to those who have lately raised the price of turf to more than double what it had been a few years since. In many other articles the inhabitants of Limerick will find the benefit of this great undertaking, as the highest carriage from beyond Killaloe to Limerick will not exceed 2s. 6d. per ton. The company have also directed that all turf brought by the canal shall in future be deposited below the lock, and at the several quays, for the accommodation of the public.

October 24.—Yesterday morning the house of Mr. Folliott Magrath, of Fleet street, was discovered to have been robbed of a large sum of money, amounting to upwards of 600 guineas. It was taken out of the desk the evening before by a young boy, his apprentice, with a false key, and with which he has absconded.

The misguided lad is supposed to have sailed for England, as it was heard he had been at the packet-houses the night before. Some persons have sailed for Parkgate to endeavour to overtake him, and recover the property.

CARLOW CASTLE.

FROM A PICTURE DRAWN UPWARDS OF A CENTURY AGO.

(From the "Anthologia Hibernica," Dec., 1793.)

Carlow, anciently called Catherlogh, or the City, or Fort, on the River, owes its origin as a town to a castle erected there in the reign of king John, which secured a pass over the Barrow.

The castle is boldly seated on an eminence over this noble river:—It is an oblong square, flanked with round towers, after the manner of Norman castles of equal date. Some writers tell us it was constructed by lord justice Lacy in 1180. Let this be as it may, it was always considered as a strong protection of the English pale in Leinster, particularly against the MacMurroughs, who assumed the titles of kings of that province. These and the other Irish pressed the English so much, that by a record in Bermingham tower, of the 37 Edw. III., "Pro Barrio amovendo a Catherlogh usque ad Dublin," we find they were obliged to retreat from it. However, in a short time it was retaken, and in 1397 was seized by Donald Mac Art Cavenagh, chief of the Mac Murroghs. In 1494, James, brother to the eighth earl of Kildare, was attainted for possessing himself of Carlow Castle, and favouring the impostor Perkin Warbeck, in a parliament held in Drogheda that year.

Robert Hartpole, constable of Carlow, in 1577, issued from that castle, with fifty men, to release Harrington and Cosby, that were prisoners to Rory Oge Omore, chieftain of Leix: he effected his purpose, but the arch-rebel escaped in the dark. The 30th of July, 1604, the earl of Thomond and his son were appointed constables of Carlow for their lives, and the earl chief leader of the forces in the province.

In 1642, four troops, under Sir Patrick Wemys, were sent from the earl of Ormond's army to relieve Carlow. It was defended by 700 men, but on the approach of Wemys they fled, and burnt the town. About fifty were slain in the pursuit, and 500 English delivered from imprisonment in the castle, where they were almost starved. In 1650, the castle was in the hands of the confederate Catholics; but after a close siege was surrendered into the hands of the parliamentary forces.

THE HISTORY AND ANTIQUITIES OF THE CITY OF DUBLIN.

FROM THE EARLIEST ACCOUNTS:

Compiled from Authentick Memoirs, Offices of Record, Manufcript Collections, and other Unexceptionable Vouchers,

By THE LATE WALTER HARRIS, ESQ. WITH AN APPENDIX.

CHAPTER VI.—Continued.

The modern manner of surveying and perambulating the city liberties every third year is thus:

They draw up at the custom-house, then pass along Essex street, Temple bar, and to the east end of Lazer's hill, from thence to Ring's-end, and so to the low water-mark, where the dart is cast. From thence they cross the strand to the Black-rock,† and so westward to a Red-house on the east side of Merrion.† From thence through the garden on the back of the Red-house, and across the fields to Simon's-court; from thence across the fields into the road to Bray, and then southward along the said road to two little cabins on the south side thereof. From thence they cross the fields into the road to Clanskiagh, opposite to a mill on the river of Donny-brook; from whence they pass along the said road to the bridge of Clanskiagh, and under the east arch thereof, and then to and through the mill of Clanskiagh-lane,† and from thence along the said lane to Mill-town road, and then northward to Mr. Roberts's house in the said road, which they passed through and the garden belonging to it, across the fields to Donny-brook road, near a cabin on the right hand thereof; from whence they proceeded northward along Donnybrook road to the sign of the Currant-tree on the west side of the said road, and from thence by the south end of the said house through the garden, and crossed the fields at the back of Mr. Leeson's house at Stephen's-green, till they came to the corner house of St. Keivin's-port, on the east side thereof, and through the said house. From thence they passed by the west side of Keivin's-port to and through Big-butter-lane to Bride street, and along Bride street to Bull alley, and down it to the house formerly counsellor Swift's, which, and the garden thereof they passed through into Patrick street, and from thence to the sign of king William and queen Mary on the west side of the said street, and through the back side thereof to the Coomb, at a great stone that stands in the street; and from thence along the Coomb by the water-course to Crooked-staff. From thence over the wall on the west side of Crooked-staff between the willow trees, and along the water-course to a malt-house at the west end of Dolphin's barn, including the said malt-house and garden westward of it. From thence they proceeded northward across the fields, and through the garden and Red-house, at the north end of Cut-throat-lane. From thence they made their way to Bow-bridge, and passed under the middle arch of the said bridge, and then into the hospital fields over the old Deer-park wall, near the old Slaughter-house. From thence through the Hospital fields, and across the Liffey strand to a round stone by the Deer-park wall.† From thence they passed over the Deer-park wall, and through a part of the park to a corner of the wall near the Dog-kennel, on the north side thereof. From thence over the said wall northward, and passed along the same to the first half round or rising on the said wall. Thence they proceed eastward through Mr. Brownlow's fields, and several gardens to Stonybatter on the south end of Mr. Addison's house, and from thence through a house at which hangs the sign of a Half-moon, on the east side of Stonybatter, and through the gardens to Colonel Stanley's house and through the said house to Grangegorman-lane, and through the gardens into Finglas road,† and from thence northward to the Broadstone. From thence through the water-course that passes by the stone, and through the gardens into Drumcondra road;† thence southward to a little cabin at a well† in a garden on the east side of the road. From thence thro' the gardens to the sign of the Coach and horses in Ballybough-lane, and then northward along Ballybough-lane to Ballybough-bridge. From thence across the river, and along the strand to Clontarf, and so to the shades of Clontarf, and from thence forward to the mill of Rahenny, and from the mill northward one hundred and thirty perches to a little brook which is the end of the liberties of the city of Dublin.

Note.—In this progress they took several stations, marked with a dagger, where they called courts.

It may not be thought impertinent to the subject, to annex here a short account of the franchises of the liberties of St. Sepulchre's, Dublin, as the same appear in a controversy concerning the same, supported by Hugh Inge, archbishop of Dublin in the year 1524, against the citizens, for their violation of the said liberties, which by a petition to the lord deputy, Gerald earl of Kildare, and the privy council, and a reference by them to the three chief judges, was by their report fully determined that year; the whole proceedings of which, word for word, may be found in the black book before cited (p. 219).

To the right noble lord Gerald earle of Kildare, the king's deputye of Ireland, and the king's councell of the same.

"In moste grevious manner sheweth unto your discreete wisdomes Hugh archbusshopp of Dublin, and primate of Ireland. That whereas hee and all his predecessors have bein peaceably seised out of tyme of minde to the contrary, of the mannor and lordshipp of St. Pulchre's, with all the appurtenances, liberties, franchises and suites of courts unto the said mannor belonginge in their demeane as of fee; as in the right of the said archbusshoppricke, by the graunts of our soveraigne lord's the king's most noble progenitors; So it is, that one Nicholas Coitrotte, merchant, late maire of the cittie of Dublin, Bartholomew Blanchfeld and John Candelle, bayliffs of the same, accompanied with two hundred more of the sensuall (Severall in alio MS.) persons in a riotous manere, contrary to our soveraigne lord the king's peace, and all good order, envaded and entred within the said lordship, liberties, and franchises of St. Pulchre's, and there then keste down ditches and hedges, otherwise riding their franchises than any of their predecessors did before this tyme, to the great hurte and prejudice of the said complainant, in the diminishing of his right liberties and franchises. The premisses considered, that it would please your moste discreete wisdomes to call before you the said Nicholas Coitrotte, and the foresaid bayliffs, and to take such direction in the premisses, that they be punished for the said riote and wrongs, according to right and conscience, in avoyding of further inconveniences that may ensue in tyme."

"Hit is decreed by my lord deputye, and king's councell, that the chief judges shall have the examination of this matter, and it to order decree and finish, that they to certifie my lord deputye and the king's councell of the same."

Decretum Judicum.

"Be it known unto all men, That whereas the most reverend father in God, Hugh archbusshopp of Dublin, complayned unto Gerald earle of Kildare, the king's deputie of Ireland, and the king's councell of the same, that whereas hee and all his predecessors, as in the right of his cathedrall church, have bin peaceably seised of all the chiefe rents and fruits to his courts, as to his lordshipp and mannor of Sepulchre's, of all the burgages on the east side of St. Patrick-street; that is to say, from the north side of the house where Nicholas Boyse, tailour, late dwelled, called the lady of Thamolyne's house or ground unto St. Patrick's-gate, which precinct is within the franchises, crosse and liberty of the said archbusshopp, and he and his predecessors out of tyme of mind of anie man to the contrary, have used their franchesses, cross and liberty there, till now of late that Nicholas Coitrotte, late maire of the said cittie, and the citizens of the same, in ryding and bounding their franchese and liberty of the said archbusshopp, which matter of complaint was by the said lord deputie and councell remitted to be ordered and redressed by us Patrick Birmingham, chief justice of the king's chief place, Richard de la Hoyde, chief justice of the king's common place, and Patrick Finglass, chief baron of the king's exchequer in Ireland, and we hearing and

examining the allegations, possessions, rights, titles and evidences of either of the said parties, and walking the bounds and mears of the same, by good and mature deliberation doe order and decree the said precinct from the north syde of the said house where Nicholas Boyse late dwelled, called the lady of Thamolyne's ground on the east syde of the said street unto St. Patrick's-gate, to be with the franchess, crosse and liberty of the said archbusshopp, as pertaining to his mannor of Sepulchre's; and that hee and his successors from hereforth shall have and enjoy their antient rents, suits, and franchesses there without lett, interruption, or grievance of the said maire of Dublin, or cittyzens of the same, or their successors for ever. In witness whereof we the aforesaid Patrick, Richard and Patrick unto his our award and decree have subscribed our names."

Chap. VII.

Of the interludes and plays anciently represented on the stage by the several corporations of the city of Dublin.

The city of Dublin anciently consisted of twenty corporations, to which five have been in latter times added. Of these we shall be more particular when we come to treat of the political state and division of the city; it being sufficient for our present purpose barely to hint their numbers.

An ancient custom prevailed for a long time in the city of Dublin always against the great festivals of the year to invite the lord deputy, the nobility, and other persons of quality and rank to an entertainment, in which they first diverted them with stage plays, and then regaled them with a splendid banquet. The several corporations also upon their patrons' days, held themselves obliged to the like observances, which were for a long time very strictly kept up and practiced.

We are told from a writer (Robert Ware, M.S.) (to whom in other respects we are much obliged), "that Thomas Fitzgerald, earl of Kildare and lord lieutenant of Ireland, in the year 1528, was invited to a new play every day in Christmas, Arland Ussher being then mayor, and Francis Herbert and John Squire bayliffs, wherein the taylors acted the part of Adam and Eve, the shoemakers represented the story of Crispin and Crispianus, the vintners acted Bacchus and his story, the carpenters that of Joseph and Mary; Vulcan, and what related to him, was acted by the smiths, and the comedy of Ceres, the goddess of corn, by the bakers. Their stage was erected on Hoggin-green, now called College-green, and on it the friors of St. John of Jerusalem, of the blessed Trinity, and of All-hallows, caused two plays to be acted, the one representing the passion of our Saviour, and the other the several deaths which the apostles suffered."

This account may probably in its material parts be true; but in circumstances the author of it undoubtedly errs. For Pierce Butler, earl of Ossory, was lord deputy of Ireland from the 13th of May, 1528, to the 22nd of June, 1529, and from the intervening Michaelmas the persons mentioned administered the offices of mayor and bailiffs. Thomas Fitz-gerald was, indeed, lord deputy for a very short time to his father, Gerald, in 1534; but then Robert Stillingforth was mayor, and Henry Plunket and William White bailiffs; so that we are under a necessity of appropriating these entertainments to the government of the earl of Ossory.

Something upon this subject is to be met with in a manuscript in the college library, where it is said, "that in the parliament of 1541, wherein Henry VIII. was declared king of Ireland, there were present the earls of Ormond and Desmond, the lord Barry, Mac-Gilla-Phadrig, Chieftane of Ossory, the sons of O-Bryan, Mac-Carthy-Mor, with many Irish lords, and on Corpus Christi day they rode about the streets with the procession in their parliament robes, and the Nine Worthies was played, and the mayor bore the mace before the deputy on horse-back. The sunday following king Henry was proclaimed king of Ireland in St. Patrick's church, and the next sunday they had tournaments on horse-back, and running at the ring with spears on horse-back." Sir James Ware hints (Annal Hen. VIII. ad. an. 1541) at the same thing in a few words. "Epulas, Comœdias, et certamina ludicra, quæ sequebantur, quid attinet dicere? It is needless (says he) to relate what feastings, comedies, and sports followed." It is said also in the college manuscript before cited, that in an expedition made against James Mac-Connell by the lord deputy Sussex in 1557, he was attended by John Ussher captain, and Patrick Bulkely petty-captain, with sixty of the city trained-bands, and upon their return the Six Worthies was played by the city, and the mayor gave the publick a goodly entertainment upon the occasion, found four trumpeters horses for the solemnity, and gave them 20s. in money."

Among other days of solemnity, the festival of St. George was celebrated with high veneration. In the chain-book of the city of Dublin are several entries to that purpose.

I. It was ordered in maintenance of the pageant of St. George, that the mayor of the foregoing year should find the emperor and empress with their train and followers well apparelled, and accoutered, that is to say, the emperor attended with two doctors, and the empress with two knights, and two maidens richly apparelled to bear up the train of her gown.

Item II. The mayor for the time being was to find St. George a horse, and the wardens to pay 3s. 4d. for his wages that day. The bailiffs for the time being were to find four horses, with men mounted on them well apparelled to bear the pole-ax, the standard, and the several swords of the emperor, and St. George.

Item III. The elder master of the guild was to find a maiden well attired to lead the dragon, and the clerk of the market was to find a golden line for the dragon.

Item IV. The elder warden was to find for St. George four trumpets; but St. George himself was to pay their wages.

Item V. The younger warden was obliged to find the king of Dele and the queen of Dele and also two knights to lead the queen of Dele, and two maidens to bear the train of her gown, all being entirely clad in black apparel. Moreover, he was to cause St. George's chapel to be well hung in black, and completely apparelled to every purpose, and was to provide it with cushions, rushes, and other necessaries for the festivity of that day.

No less was the preparation of pageants for the procession of Corpus Christi day, on which the glovers were to represent Adam and Eve, with an angel bearing a sword before them.

The Corrisees (perhaps curriers) were to represent Cain and Abel, with an altar, and their offering.

Mariners and Vintners, Noah, and the persons in his ark, apparalled in the habits of carpenters and salmon-takers.

The weavers personated Abraham and Isaac, with their offering and altar.

The smiths represented Pharaoh, with his host.

The skinners, the camell with the children of Israel.

The goldsmiths were to find the king of Cullen.

The hoopers were to find the shepherds, with an angel singing, "Gloria in excelsis deo."

Corpus Christi guild was to find Christ in His passion, with the Marys and angels.

The tailors were to find Pilate with his fellowship, and his wife clothed accordingly.

The barbers, Anna and Caiaphas.

The fishers, the apostles.

The merchants, the prophets.

And the butchers, the tormentors.

These interludes and representations carried with them the appearance of the superstition of the times, which John Bale, bishop of Osory, afterwards laboured to reform, by writing with more sobriety several comedies and tragedies in the reign of king Edward VI. and, during his banishment, in that of queen Mary, upon religious subjects. Several of those pieces are yet extant printed in the black letter; and, though they show the taste of that age, they would by no means please the present. Such plays and interludes gradually went into disuse as the reformation gained ground, and were at length totally banished by the improvements of the theatre, and the excellencies of those whose peculiar profession it was to entertain the public on the stage; between whose performances and those ancient ones, no unapt comparison may be drawn from the distant ages of Thespis and Roscius.

Other diversions have been substituted in the room of those that were laid aside. On several days during Christmas, the lord mayor entertains the citizens with music and balls, and many of the corporations on their respective patrons' days walk in

procession about the streets, dressed out in the several colours and emblems belonging to their trades; from whence they retire to church to hear the word of God, and from thence to an entertainment provided at the charge of their corporations.

(To be Continued.)

ROYAL FEAST.

(From "The Circuit of Ireland," a Poem, Translated by John O'Donovan, Esq.)

The noble kings were attended
According to the pleasure of the race of Niall;*
Without sorrow, without gloom in the house,
As if they had been clerics.
Ten score hogs—no small work—
Were slaughtered at the festive Aileach,†
For Muircheartach‡ of the great fetters.
Three score vats of curds,
Which banished the hungry look of the army,
With a sufficiency of cheering mead,
Were given by the magnanimous Muircheartach.
Twelve vats of choice mead
Were given to the kings of Erin.
The dinner of an hundred of each kind of food nobly
Was given gratuitously to them from the Queen.
Sabia (1) of Ballagh Gabhran, district of glens,
Has surpassed the women of Erin,
In chastity, in wisdom, in purity,
In giving, in bestowing.
The blessing of every man with a tongue
Be on the good, great daughter of Kellach;
And the blessing of the pure and glorious Christ
Be on the daughter of the King of Ossory.
I have not seen in south or north,
Throughout all Erin of red weapons :
I have not seen in west or east
A woman like thy wife, O Muircheartach,
While the kings of battles were detained
In the lordly Aileach Frigreann,
They received no coigne from any one else,
Except from the good Dubhdaire, the black-haired.
O Dubhdaire, it is not better
That any other youth than myself should be thankful;
God and man go thankful from the house
Of Dubhdaire, descendant of Tighernach.
The reward of her plenteous ale was given
To the lovely, modest-faced Dubhdaire,
Out of the plunder of the cold Dalaradia,
In gold, in oxen, in good cows—
Twenty cows for every cow—nobly;
Twenty oxen for every one ox,
Twenty hogs for every hog—a good return—
Were given to Dubhdaire by Muircheartach. (2)

*Niall Frossach, monarch of Ireland in the year 763.

†Aileach. The royal palace of the Irish chiefs or kings of Ulster, of the northern Hy-Niall race, situated on a lofty hill in Innishowen, in the county Donegal.

‡Muircheartach, or Mortagh, son of Niall, king of Aileach, and Hector of the West, was killed in an engagement with the Danes in the year 943.

(1) Sabia, probably the mother of Dubhdaire, queen of Aileach.

(2) It appears from this passage that the possessions and property of the wife and husband were considered as distinct at the period this poem was written.

A cafe is drawing trade in Chicago by advertising that every table is equipped with a telephone. This latest innovation is called a "snap jack." The telephones are movable, so that a diner may order one with his meals. Connection is made simply by dropping a dime in a slot in a box underneath the apparatus. A man may, therefore, eat, and talk with anyone miles away.

FOUGHT AT FONTENOY.

THE MARQUIS d'ARGENSON.

HIS DESCRIPTION OF THE BATTLE.

One of the most valuable additions to the series of French memoirs will be found comprised in the two volumes collectively entitled "Journal and Memoirs of the Marquis d'Argenson," translated by Katherine Prescott Wormeley. The original manuscript is preserved in the library of the Louvre, and a correct edition of it was for the first time published in 1859 by the "Societe de l'Histoire de France." The present translation is an abridgement of that edition. The work here reproduced is not a journal in the ordinary sense of the word, but rather a collection of notes and memoranda jotted down in connection with the events of the date mentioned. They present the reflections of a sagacious, far-sighted, and honest man on the personages and topics of the time. Taken together, they set forth a picture of the first forty years of the reign of Louis XV., years in which the undermining of the ancient regime was well advanced, and in which the collapse of the existing political fabric was already perceived by certain observers to be impending. Of these observers the author of these memoirs was one. He saw that the inevitable outcome of the all-pervading political and social corruption would be a revolution, though he did not anticipate that the transformation would be a violent one. The author himself was rather a philosopher than a statesman, a man of the closet rather than a man of affairs, although at an important crisis he occupied, as we shall see, a high post in the French Ministry. From a political viewpoint, he was overshadowed by his father, the Marquis d'Argenson, who was Lieutenant-General of Police during the last eighteen years of Louis XIV. and Keeper of the Seals under the Regency; and also by his younger brother, the Comte d'Argenson, who was one of the most eminent and efficient tenants of the War Office during the reign of Louis XV. On the other hand, as a student of political problems, he is not altogether unworthy to rank among the great thinkers of his century, Montesquieu, Voltaire, Rousseau, Turgot, Necker, and the elder Mirabeau. The memoirs of such a man are well worth reading, and Miss Wormeley has rendered a service by making them accessible. We subjoin an outline of the author's life, for further details of which the reader is referred to a paper by Sainte-Beuve, which forms the introduction to these volumes.

The grandfather of the author of these memoirs was Rene de Voyer d'Argensen, a nobleman of ancient stock, who, while French Ambassador at Venice, ruined himself by his lavish expenditure, and withdrew to his estates in Touraine in 1628, where, in the eyes of the noblesse de l'epee, he made a mesalliance by marrying the heiress of a magistrate. It was their son, Marc Rene, who became Lieutenant-General of Police in the last decade of the seventeenth century, and, under the Regency was made Keeper of the Seals. Rene Louis de Voyer, the eldest son of Marc Rene, was born in October, 1694. Of a reserved and retiring disposition, he was not appreciated by his father, who much preferred his younger son, the Comte d'Argenson, who was for many years to fill the office of Minister of War under Louis XV. The elder son, the author of these memoirs, was at first treated by the world as he had been at home by his father, and was nicknamed d'Argenson le Bele (the stupid), to distinguish him from his witty brother. Though Rene Louis subsequently strove to become a man of the world, he was never like his brother, a social favourite. In his attitude toward others he was natural rather than artificial; sincere, not complaisant; and he sought to cultivate rather than to smother his inborn integrity and sense of justice. We would not imply that he was immaculate—so much could hardly be expected of a young man entering Court life on the eve of the Regency; but he was so much better than the majority of the men around him that he seemed out of place at Versailles in the second quarter of the eighteenth century.

Made a Counsellor of the Parliament of Paris at 21 years of age, Rene-Louis d'Argenson entered the Council of State five years later, and in 1724 was appointed Intendant of Hainaut and Cambresis. We are told that, while he occupied this office, John Law, the famous Scotch financier, whose "system" was accused of bringing France to the verge of ruin, tried to cross the province of Hainaut in order to escape into foreign lands. D'Argenson had him arrested and held at Valenciennes until he received orders concerning the fugitive from the Court. It was then that Law said to him in the course of a long conversation: "Monsieur, never could I have believed what I have seen during my administration of the finances. Let me tell you that this kingdom of France is governed by thirty intendants. You have neither parties, nor committees, nor assemblies, nor governors. I might almost add neither King nor Ministers. It is on thirty masters of petitions, clerks in the provinces, that the welfare or misery of those provinces, their plenty or their sterility, depends." We now know that France was by no means so thoroughly centralised under the Regency as Law supposed, or as it became under the First Napoleon. The centralising machinery organised under Louis XIV. was continually tramelled and blocked by traditional claims, exemptions and privileges mobiliary, ecclesiastical, parliamentary, and municipal; by enclosures of land and islets abstracted from the operation of general laws; by relics of powers and institutions belonging for the most part to the earlier feudal system, which, though encroached upon from time to time and to a large extent superseded, had never been formally abolished. That young d'Argenson appreciated the possibilities of an intendancy is evident from that part of his memoirs which deals with his experience in Hainaut. He records new and sensible views concerning a number of matters of public utility; he writes memorials upon them to the Ministers, in the hope of getting them approval; and, if approved, he applies them resolutely. He was a man fertile in ideas, and at no loss for expedients and innovations when confronted with difficulties in his administration. Paternal despotism seems to have been his ideal. A Socialist seated on a throne would have come near to answering his conception of good government.

In his administration of Hainaut he was a vigorous asserter of authority, yet, at the same time, he showed himself inspired with a veritable passion for the public good, and with a sort of tenderness for the poor people, exhibiting in particular commiseration for the sufferings of the peasantry. He inveighed particularly against two of the flagrant evils of the ancien regime—to wit, absenteeism on the part of many landowners, and the fact that public office, being the subject of purchase, had come to be regarded almost exclusively as a source of private profit. One of d'Argenson's maxims was that, while the sense of ownership ought to be intensified in the landed proprietor, public office should

never be looked upon as private property by the officer entrusted with it. In his intendancy, however, as subsequently, when he became a Minister of State, d'Argenson showed himself an idealist rather than an opportunist; a political philosopher rather than a practical statesman. He knew himself to be lacking in tact, and hoped that he should be able to remedy this defect by experience. It is probable, however, that, like most men of sturdy honesty, he underestimated the lubricatory value of the quality he lacked. He tells in his journal of a valuable intendant, who, however, was so harsh and violent that he was finally discarded as impracticable. D'Argenson's comment on him is: "If I were Prime Minister, I should like to have thirty intendants of that mould; I could do good work with such disinterested and active agents." He more than once privately indulges in the supposition, "If I were Prime Minister," and more than once believed himself on the point of attaining the post. He never did attain it, however, but, as we shall see, was himself discarded on the score of impracticability.

After quitting his intendancy, d'Argenson became once more a Councillor of State, a function in which, as he said, "one has but one suffrage for the thirtieth part of a decree." Naturally, such an office seemed to him a poor compensation for his little vice-royalty in Hainaut. Nevertheless, in his own way, he tried to make himself useful, and applied his mind continually to this discovery of new and just administrative measures. He would write memorials on the different matters then under discussion, until, at last, when some new difficulty would arise at the Council of State, the King would now and then be heard to say, "Is there no memorial by M. d'Argenson about this?" Chauvelin, the Keeper of the Seals, conceived esteem and friendship for d'Argenson, and strove to make his political fortune. He appreciated the younger man's fertility of mind and qualities as a worker, but recognised his defects and endeavoured to correct them. While praising his industry and his ardour to be useful, and "a certain firmness of heart and mind in which he sympathised," he continually told him that he must go more into society, and emerge from the species of obscurity in which he lived. D'Argenson explained that, having been long misunderstood and kept in the background by his father, he had become discouraged, and led to shut himself up within himself. He promised, however, to mingle more freely with the world, and thus qualify himself for official promotion, but he was never able thoroughly to carry out the project. The dismissal of Chauvelin, which occurred in 1737, was a grievous mishap for d'Argenson; thenceforth Cardinal Fleury was not so well disposed toward him, and became his enemy. One day the Cardinal, who seldom spoke ill of any one, said of d'Argenson: "In short, to say the whole thing, he is a worthy friend of Voltaire, and Voltaire is a worthy friend of his." In February, 1741, however, d'Argenson succeeded his younger brother in the office of Chancellor to the Duc d'Orleans, and three years later in 1744, the King appointed him a member of the Royal Council. Finally, in November, 1744, he was made Minister for Foreign Affairs, his brother being already established in the War Office. His tenure of the post lasted until February, 1747. For the history of France during this short, but momentous period, the writings of M. d'Argenson supply copious materials. To his comments on the battle of Fontenoy, the closing scene of which he witnessed, we shall presently refer. The two and a half years of his ministry were glorious years for France, but they were by no means conducive to his personal advancement. Tested by the exigencies of an active career he was considered to have failed. He was full of ideas, but he could not persuade others to adopt them.

For example, he wished for peace, a peace which to his mind would have been more advantageous to France than the one subsequently signed at Aix-la-Chapelle. He had plans, too, for political reconstruction in foreign countries, especially Italy; he wanted to form "a Republic or fraternal association of the Italian powers, just as there is in Germany; a Batavia and Helvetia; for this is the greatest affair that has been treated of in Europe for a long time." None of his projects was carried out. His detractors ultimately convinced the King that he was "incapable of all public affairs," the Duc de Richelieu called him "the Secretary of State of the Republic of Plato." He was summarily dismissed without a pension, but he was not sent into exile. Thenceforth a public career was closed to him. He became once more, what he had been previously, a studious man, a great reader, making his library his world, and ever full of observations and thoughts on books and things. Repeatedly in the later pages of his journal he complains of the spirit of satire and malice which pervaded contemporary French society, of the absence of heart and of a love of good which was everywhere apparent. As Sainte-Beuve points out, nobody can better recognise the malady of the eighteenth century, especially the first half of it, than in reading the observations of the Marquis d'Argenson. "The heart," he says, "is a faculty, of which we deprive ourselves daily for want of exercise, whereas the mind becomes keener day by day. We count intellect, we cultivate it, we are becoming wholly mental." He goes on to say that, as a matter of fact, "it is mind joined to heart that makes heroism, courage, whatever is sublime, and from which results genius. From want of affection and the heart faculty this kingdom will perish. I predict it. We no longer have friends, we no longer love our mistresses; how, then, shall we love our country?" Elsewhere he notes that finesse was the order of the day, the style of the times, especially caustic finesse, epigram, irony. "Politeness seemed to repress all external violence, that inward baseness might thrive the better." Again, "We see nothing but people whose hearts are dull as pigs, for this country is given over to paralysis of the heart; nevertheless, you will hear it said that it is fine to be sensitive to friendship to virtue, to sorrow; they play at feeling as if they felt it."

The Marquis d'Argenson died in January, 1757. The years which succeeded his dismissal from the Ministry were the happiest of his life. He dwelt sometimes in Paris and sometimes in the country at Segres, near Arpajon, where he had hired a country house. Here he received d'Alembert, Condillac, and other men of letters. Voltaire was there in the spring of 1750. The dismissed Minister loved long conversations, consecutive and serious, albeit enlivened with wit. He loved them for the interchange of ideas, and was not one of those talkers who desired to monopolise the discourse. "Who does not listen, or listens ill," he thought, "narrows his mind more than the man who never reads. I call it good listening and good reading to do both without bias toward the speaker or writer." He believed in reading, considered as a feeder of the intellect. "Young people," he said, "should get it into their heads that the more they read the more mind they will have." He took books by their good side, and nearly always found in them some subject for reflection or pleasure. "I tell our usual friends: How I pity you for being always critical. When will you begin to enjoy anything?". What he personally preferred was books on politics, considerations of the public good, and of social matters.

D'Argenson's religious beliefs reduced themselves pretty nearly to a belief in Providence; upon this, however, he insisted and he found those blameworthy who professed to do without it. He seems to have contented himself with the distribution of good and evil, which, in his opinion, was carried out fairly, sooner or later in this world. "Having well weighed everything I find that man is born here principally for his own happiness. Working for it, understanding it properly, he serves his neighbour as much as he ought; not doing injury is a good deal; take away the evil and the good remains." He believed that the unhappiness of man comes from anxiety and from the eternal pursuit of something else instead of enjoying what he has. "Men," he says, "are always on the move toward something, never at rest." "It is a bad and very extraordinary habit," he thinks, "of which we could be corrected by the progress of universal reason." For himself he is happy and content to live; it seems to him that he is present at a fine spectacle, a charming dream; if, at times, the spectator has a desire to be an actor, it is a mistake; he is hissed and he repents.

In D'Argenson's best-known work, "Considerations on the Government of France," he undertakes to show how far democracy can be admitted into monarchical government. Although he belonged by birth to the high noblesse, he had no prejudices in favour of feudality, and did not sympathise with the laments which he heard from the nobles around him. "These gentlemen," he said, "who complain of their rank not being sufficiently supplied with the gifts of fortune are nothing but poor pond pike, who have not enough carp to eat; no, none is to be pitied except those who lack necessities" D'Argenson was not a republican because, as he said, "republics have no head"; but he wanted the monarchy reformed. He attributed the abuses and evils of the ancient regime to the fact that it failed to lift France "not from beneath her kings, God forbid! but from beneath an odious aristocracy—not an aristocracy of nobles who think nobly, but a satrapy of officials who have put all things into stiff forms, bad regulations and mischievous principles." He thought that "to govern better it was necessary to govern less," and to reorganise the monarchy by the help of an enlightened democracy, well divided, and, consequently, not dangerous; that is to say, by a county and municipal system. He would have liked to see a re-establishment of the communes through the direct interposition of royalty. In a word, the Marquis d'Argenson belonged, as we have said, to the small group of eminent Frenchmen among whom Montesquieu and Turgot are in different ways conspicuous, who, had they been listened to, might have saved the old French monarchy by transforming it judiciously.

Among the few quotations which we are here able to make from D'Argenson's writings should be included an extract from a letter to Voltaire dated May 15, 1745, and describing the Battle of Fontenoy. "There was," he says, "a terrible hour in which we saw the second volume of Dettingen, our Frenchmen humbled before that British firmness whose rolling fire resembled hell, and, I own dumb-founded inactive spectators. Then we despaired of the republic. Some of our generals, who have more courage of heart than of mind, gave very prudent counsels; they sent orders to Lille, they doubled the guard around the King, and they made ready to send him off; but the King only laughed at them all. He rode from the left to the centre and called for the reserves and the brave Lowendahl. But there was no need of them. Another reserve charged. It was the same cavalry which had charged in the beginning uselessly—the King's household Guards, who had remained stationary, and the Irish, excellent above all when they march against the English and the Hanoverians. Your friend, M. de Richelieu, is a true Bayard. It was he who gave the advice, and executed it, of advancing on the enemy like hunters, or like foragers, pell-mell, hands low, arms shortened, masters, valets, officers, cavalry, infantry, all together. This French vivacity, of which so much is said, nothing resisted. It was an affair of ten minutes with that thrust. The big English battalions turned their backs to it, and, to tell it briefly, we killed 14,000. It is true that the cannon have the honour of that horrible butchery. Never have so many cannon and such heavy ones been fired in a general battle as at Fontenoy." The Marquis d'Argenson was one of the few men, if not the only man, then alive in

France who was capable of writing in the same letter: "To tell you the evil as well as the good, I remarked a habit, too quickly acquired, of seeing tranquilly on a battlefield the naked dead enemies in their death-throes, smoking wounds. For myself, I own my heart failed me, and I needed a flask. I observed our young heroes well; I found them too indifferent in this respect. I fear, as the result of such a life, that a taste will develop for this inhuman butchery." He adds "Triumph is the finest thing in the world; the "Vive le Roi!" the hats in the air on the points of the bayonets, the compliments of the master to his warriors, the visit to the intrenchments, the redoubts, the village all intact, the joy, the glory, the tenderness!—but the ground of all this is human blood and fragments of human flesh!"

Under date of February 19, 1749, we find a description of the unhappy state of things in France a few months after the conclusion of the peace of Aix-la-Chapelle: "It is known only too well by intelligent persons that all is in great fermentation among the people of France, that discontent is rising to a high degree, and that great contempt for the Government is added to it. The person of the King is still loved; but all those about him, without exception, obscure and enfold him in a black cloud. The taxes exasperate the people, living is dear, receipts are few; we must spend without receiving; the odious reign of the financiers alarms the public and degrades the Government; there is not a bourgeois here who does not shout against the peace, declaring that we have given up everything to the enemy, and seeing in it only evil without good. All things are taken ill; even the late diminution of taxes is thought so paltry that it shocks rather than pleases. They talk incessantly of the mistress (Mme. de Pompadour), for whom so many buildings, journeys, gifts, expenditures are made. They read the gazettes, they see that our policy in other countries is ill managed, and that we shall soon have either shame or war, and they want neither."

In October of the same year, d'Argenson paid a visit to his estates in Touraine. This is what he found there. "I see nothing but frightful misery; it is no longer a sad sense of poverty, it is despair which now possesses the poor inhabitants; they long only for death, and they avoid giving birth to children. When will such woes end? Our Ministers are incapable of making the King reflect on all this; he is kind, but so ill served. A zeal for fine roads has taken possession of the Ministry and the provincial attendants: the latter no sooner found this career of authority and usefulness open to them than they flung themselves into it headlong. It is a new taille tax, worse than the first, under which the people are thrust. It is reckoned that annually one-quarter of the day's work of the labourer goes to these corvées (statute and compulsory labour) during which they have to feed themselves, and with what? Their horses, mules, and oxen are also forcibly employed without compensation." D'Argenson goes on to say that "Daily one hears of new and horrible injustices in the provinces. By what my neighbours tell me the diminution of the inhabitants during the last ten years is more than one-third. The great roads made by forced and unpaid labour are the most horrible tax ever yet endured; the labour and subsistence of the men are beyond their power to meet; they are taking refuge in the small towns; there are quantities of villages abandoned wholly by their inhabitants."

We must conclude our notice of these volumes with an extract from a page of the journal indited in January, 1751, in which d'Argenson discusses the relative positions of the French and the English in North America, as determined by the Peace of Aix-la-Chapelle. "D'Anville, the geographer, has shown me on a map what were the claims of the English against us in America. With their Acadia (which they call New Scotland), they claim the right to push that possession to the right bank of the St. Lawrence River. They have claims on the Island of St. John's, although they have ceded to us the whole of the Gulf of St. Lawrence. To the south, they claim to confine the Spaniards to their Florida, and to leave them precisely nothing but that peninsula. Passing behind Florida to the west, they claim more than half of our Louisiana as far as the River St. Louis or Mississippi; thence, still going westward, they covet our territory, which joins that of the Spaniard. To the north of Louisiana, they want to go as far as Lake Ontario; as for Canada, they surround it with their Hudson's Bay and Davis Strait, and they are trying to explore a territory for an issue as far as California. These claims, which have been shown to me, are taken from the report of M. Silhouette, one of the Commissioners to settle the boundaries with the British. Never will they agree on this: Litigando jura crescunt and they are pleaders without judges. Our adverse party has terrible strength at sea, also in her colonies, by the multitude of their inhabitants, and by their wealth. If we are to believe the English, we shall see them get possession of all North America, and the greater part of the islands between the two Americas."

THE MONTH OF MAY.

BY LAURA RICHARDS.

Is there anything new to sing about you,
May, my dear?
Any unhackneyed thing about you,
Pray, my dear?
Anything that has not been sung
Long ago when the world was young,
By silver throat and golden tongue?
Say, my dear!

So many have said that your eyes are blue,
May, my dear;
It must be a tiresome fact, though true,
May, my dear,
And if I for one, my gracious Queen,
Should boldly assert that your eyes were green,
'Twould be a relief to you, I ween,
Eh, my dear?

We know, at the touch of your garment's fold,
May, my dear,
The daisies come starring with white and gold,
The way, my dear.
We know that the painted blossoms all
Come starting up at your gentle call,
By dale and meadow and garden wall,
May, my dear.

No, I really don't think there's anything fresh
Or new, my dear.
For the world is small, and available rhymes
Are few, my dear.
So if I say naught about vernal bowers,
And forbear to mention the sunlit showers,
I think I shall make the best use of my powers;
Don't you, my dear?

And yet I cannot help loving you so,
May, my dear,
That the old words, whether I will or no,
I say, my dear,
And how you are fair, and how you are sweet
My loving lips forever repeat—
And is that the reason you pass so fleet?
Ah! stay, my dear!

A PEDESTRIAN FEAT.

If you desire to travel on foot through two kingdoms, two duchies and three principalities in the short space of five hours and ten minutes, you have no need to transplant yourself to fairyland, or put on a pair of seven league boots. The feat can be accomplished in the fatherland without any great exertion. You select as your starting point the village of Steinbach, in the Bavarian district of Oberfranken, a station on the Gera-Saalfeld-Lichtenfels railway. From here you proceed in half an hour to Lichtentanne (Saxe-meiningen), and an hour and a half later you arrive at Reuschengesess (Reuss o. l.).

The next halting place, Gleima (Schwarzburg Rudolstadt), can be reached in ten minutes, and half an hour's walk takes you to Altengesess (Reuss y. l.) From here you march on to Drognitz (Prussia) in an hour and a half, and in an equal space of time you reach the final stage of your journey, Saalthal (Saxe-Altenbourg).

OUR WEEKLY STORY

THAT ALL-NIGHT AFFAIR

A JOURNALIST'S TALE.*

One cold winter's night, of the time that Schneider and I worked together seven days a week on the Chicago "Mid-West," he came to me and asked if I wished to participate in a minor scoop, involving, perhaps, some adventure. The glory of the scoop, he explained, would redound chiefly to him, but of the adventure I might partake equally.

Said he: "There is something out on the lake; people have been watching it all the afternoon——"

"Yes; the 'Journal' played it up as a sea monster," I interrupted, "with illustrations."

"It seems to move," he went on imperturably; "and it is probably a dog watching beside the dead body of its master, who wandered out on the ice and then froze to death." Schneider's tone had the solemnity arising from the faith and imagination that make the star reporter. He continued: "The dog could come ashore if it liked, but it stays there hungry and cold, faithful to the end. Perhaps its master is a little child (that would add half a column to the story); anyway, we'll go out and rescue it and scoop the town."

I might have asked why our blandishments would lure the dog away, when hunger failed to. I might have inquired for further proofs that it was a dog at all. I might have flatly refused to go because of the cold and the midnight hour, and for many other reasons that any sensible person will think of. Instead, I accepted the quarter loaf of adventure with the enthusiasm that has so often led me astray. I did not even stop to inquire opposite what point of the city this suppositious dog was, nor how far out on the lake.

Schneider led me into a little ever-open basement restaurant, which went by the name of "The Sewer" among the reporters. I ought to apologise to the delicately nurtured reader for mentioning a place with such a vulgar name, and will say that this is the only time I ever entered it, usually going to "The Dirty Spoon"—again this is a sobriquet, and not the official name. In "The Sewer" Schneider bought a dozen sandwiches.

"What do you want all those sandwiches for?" I asked; "I don't want any." The very sight of the place took away my appetite. There, all sorts and conditions of men sat on adjacent high stools; and the waitresses served out scintillating remarks with pancakes, and even deigned a familiar slap or two to their favourites.

"There's no telling when we shall return," Schneider answered sententiously. "And the dog'll be hungry, and I shall be hungry, and besides you don't know what you are talking about, for you'll be hungry yourself before you get back." I had to admit that in every arctic expedition I had read of, that kind of thing always happened.

"Suppose it's only a bit of driftwood, after all, and no dog and no child?" I asked as we were travelling on the last car northward.

"Fate wouldn't be so unkind," he answered hopefully.

I, myself had not overmuch faith in Fate. The idea of a little adventure of an hour or so had not been unpleasant; but Schneider now told me that the dog had elected to be saved opposite Diversey street in Lake View, five miles to the

*A hint of this scoop manque escaped into a Western paper a few years ago. The whole truth is here told for the first time.—K. B.

north, and three-quarters of a mile out on the lake—treacherous even when frozen; and our undertaking promised to be an all-night affair. The share of glory apportioned to me was not big enough to make me as enthusiastic as Schneider, even after he had assured me that he had, in the afternoon, provided all the things necessary for the success of the scoop that Fate had overlooked—namely, a flat-bottomed boat with oars and ropes, and a bucket of water.

"What is the bucket of water for" I asked.

"To drink," he answered conclusively, "and we'll drag out the boat to cross rifts in the ice with. It'll slide over the ice like a sled."

I looked at all the other men on the cable car, going home to loving wives and children, and bitterly compared my lot with theirs. Schneider asked me, as the car reached the Limits and we got off, what I was thinking off, and I told him.

"Well, we're here now," he said cheerfully. "It's 'sink or swim, survive or perish——'"

"Freeze or thaw," I interrupted, and we walked along in silence.

Our craft was at one of those boat-letting establishments that grow plethoric with gain in summer and hibernate in winter. It was a large, safe boat, and about fifty yards from the shore. Schneider poked around beneath a shed, and found the oars and rope and the bucket of water he had promised me. As he was thus engaged, two policemen from Lincoln Park came in sight on the Sheridan Drive above us.

"Hey!" they called in a rather timid tone. Schneider paid no attention to them, growling, "If they want to talk to us, let 'em come down here." But I went on and explained that these suspicious movements of ours were but evidences of journalistic enterprise. We had a pleasant chat, they apparently as eager to preserve the entente cordiale as I was, and then they went away.

In spite of its flat bottom, the boat began to weigh as we began to drag it. Over the sand, thinly sprinkled with snow, it moved as reluctantly as a Tammany politician towards an investigating committee. "It'll be better when we get on the ice," Schneider said. But though the ice was more slippery, it also afforded a poorer foothold, and did not assist our travels.

"Suppose we desert the boat—it's quite the proper thing to do on arctic trips—and trust to the bucket to save us from a watery grave," I suggested.

Just here my right leg went through the ice up to my knee. I sat down on the edge of the boat.

"See here, Schneider, if we are drowned, the "Mid-West" will lose two valuable men," I argued.

"The reputation for having such bold and enterprising reporters will benefit the paper far more than we should by living," he replied sententiously.

We struggled on. In the half-light that filtered from the moon through the clouds, the ice seemed to stretch away to Benton Harbour, and I was about to propose that we go back and take the train around the lake and try for the dog from the other side, when my left foot went through into the lake. Again I sat upon the gunwale, rather glad of the size of the boat after all, and mopped my brow, as wet from the perspiration of philozynic toil as my feet were from Lake Michigan; but I said no word. I realised that Schneider would sacrifice a hundred such as I for that dog and that scoop.

We dragged the boat wearily up a hummock, and let it slide down the other side. In front of us was a bit of open water.

"Let's go home," I exclaimed desperately, "instead of chasing all night after an old log——"

"Dog!" he corrected. "Slide her in."

"How will you get her out on the other side? The ice looks very rotten.'

"Never mind. Push her in!"

A distant shout interrupted us. Our two policemen were back with another, a superior, and of a less pacific disposition. Evidently my conversational powers had not been sufficient entirely to allay their suspicions. The third policeman came rapidly towards us. To predispose him in our favour, I yelled to him to mind the holes in the ice. He deigned no reply, but came haughtily on. Then I was sorry I hadn't let him tumble into them. A drowned policeman would have been as good a scoop as a preserved dog, and, as it turned out, far more soothing to our feelings.

"What are you doing there?" he sternly demanded.

I began to explain, but Schneider snatched the talk from my mouth, and answered with a hauteur equal to the policeman's own: "We're minding our own business, that's what we are doing."

"And I am attending to mine. I want to know why you're taking that boat out at this time of night?"

"We're going after a dog," surlily.

"There's something black out on the lake," I hastily interposed, that he might not take us for raving lunatics, "that we think is a dog, and we want to find out if it is or not."

"Is it your dog?"

Schneider drew himself up. "We are reporters, and that dog'll die of starvation; and we're going to bring him in." He pushed the boat into the water and prepared to get in.

"No, you don't!" The policeman spoke positively. "Have you got your reporter's star?"

Schneider unbuttoned the lower two buttons of his waistcoat, turned up the flap and showed his star. At this point I am convinced that a few smooth words would have gained us the day; but Schneider was not in a conciliatory mood. He could at times be the most politic of men, at other times as exasperatingly tactless as anyone I ever saw. His whole manner during this interview had expressed the essence of contempt of court.

"How do I know you aren't going to commit suicide?" the policeman asked, half jocularly.

"I'm not convinced that you know anything," Schneider sneered.

The policeman stiffened up. "Well, you don't go any farther out on the lake while I'm here."

"Then you'd better [illegible] for we're going unless you arrest us."

"All right, then, I arrest you," the policeman said.

We all walked towards shore, abandoning the boat and all else except the sandwiches. In an aside Schneider told me that he had been trying a bluff. I had already recognised it as such.

"Will you walk or shall I send for the patrol waggon?" the policeman asked.

"We'll drive," Schneider said loftily.

Here I spoke up with more spirit than I had yet displayed, protesting that the wetness of my feet cried aloud for exercise rather than for luxurious rides in patrol waggons. Schneider yielded the point, and the three policemen set out with us for the station, a mile to the west. Schneider unwrapped the sandwiches and began eating them. At first he ate alone, I having refused to partake of them; then, prompted by his better feelings, not with any intention of bribery, he offered our captors some. The two meek policemen munched with him; the stern one maintained his inflexible pose. On the way Schneider began to talk to me about Captain Riordan familiarly. "He's still at the station, isn't he?" he asked our captors. He was, and Schneider mentioned casually to me how closely he and Riordan were in the intimacy that springs from perfect sympathy and long acquaintance. The stern policeman grew visibly uneasy at this turn of the conversation, but did not weaken.

The sergeant at the desk looked up in a matter-of-fact way as we came in, and took up his pen to write down the usual details as to age, residence, and charge. But he soon learned that we were no ordinary drunk-and-disorderlies.

"Is Captain Riorden in?" asked Schneider authoritatively.

"Yes," the sergeant drawled, "but——"

"I should like to see him at once." Schneider's tone was so confident that the sergeant evidently thought he'd take no risks. He sent for the captain.

"Ah, captain, how are you?" Schneider exclaimed, extending his hand, as that official came in.

"How do you do?" Captain Riorden answered, but it was plain from his tone that he did not know Schneider from the side of a house, and I saw that this was another bluff.

"Met you on the Appleby murder case last year." Schneider went on easily.

He stated his side and the policeman his; and both used language much politer than what I had been listening to the last half hour, and both were so reasonable, that I was amazed.

Then the captain spoke: "These gentlemen are all right. Let them go and drown themselves if they want to." His tone was perfectly courteous; but somehow I received the impression that he would not consider society greatly the loser if that misfortune overtook us.

Schneider now expressed his opinion of the policeman who had arrested us in certain telling phrases, with pointed reference to his breath—hardly more scented than the coldness of the night warranted, but a vulnerable point. To this the policeman replied but meagerly, constrained by the presence of the captain, and by the fact that he had in some measure made a break. When he went out, I followed and had a few private words with him. Schneider regarded this with suspicion. "What did you say to him?" he asked, as we were walking home—we had just missed the night car.

"Well," I admitted, "I told him that I thought he—from a layman's point of view, and not understanding what a multitude of things a scoop covered—had done just what was right."

Schneider reproved me sternly. He said I did not know the rudiments of managing a copper. I did not answer him, because he had forgotten more about policemen than I had ever known; but just the same, there is one up in Lake View who says that if ever I want anything that is his'n, it's mine.

The next day I was late at the office, through losing sleep on this crazy chase. The city editor did not say anything about it in the afternoon. About 11 o'clock at night, after I had handed in my story about a Masonic ball, he called me into his office, and looked at me reproachfully. "I have to stay in here all the time, and don't get a chance to get out and have any fun," he said pathetically; "and I think you might at least tell me about the interesting things that happen to you."

Just at first I did not understand what he

was asking about. Then the twinkle in his eye made me think of our last night's adventure, and I told him the whole story. Just when I was finishing with a few generalisations on Schneider's lack of suavity the telephone bell rang.

The city editor put the receiver to his ear. "Hullo," he said.

"Hullo!" There was a touch of asperity in his voice.

"What's that?" he asked sharply.

"Hullo! Hullo! Hullo!"

"Stand back farther from the phone," impatiently.

"See here, my friend," with decision, "if you don't know how to talk through a telephone, you'd better get some one who does. I can't hear you."

"What is the statement, sir"—his voice was cutting—"and about what?"

"Oh! oh!" the city editor's voice softened almost to an apology. "Why, that's all right. Two reporters you say? Arrested last night?" He winked at me portentously. "Sorry, but I can't tell you. I'm trying my best to find out about it myself. Good-night," and he hung up the receiver.

NOTES AND QUERIES.

Can any reader give the history of the old watch tower near Landscape at Rathfarnham. The place is doubtless known to many of them. I have several times made inquiries both from the inhabitants of the farm house adjoining the tower and from others, but no one seems to know anything about it.—E J French, St Anne's, Donnybrook, county Dublin.

THE RED HAND OF O'NEILL.

The spirited metrical form of the legend of the Red Hand of O'Neill, which the readers of the "Dublin Penny Journal" will remember, is illustrated by the following form of the legend, taken from an article on St. Kilda, in supplement to the "Cork Constitution," May 3, 1902:—"Perhaps mention ought also to be made of the old legend that two Highland chiefs agreed to race to St. Kilda from the mainland, the party first to land to receive the islands as a prize. Whether this ancient boat race was ever rowed, we have no means of ascertaining, but tradition has it that the finish was an excitingly close one, and the losing chief, seeing the coveted prize slipping from his grasp, cut off his hand and threw it on shore. He thus claimed to have landed first and claimed St. Kilda for his own." In the "Royal Exploits of Finn," there is a reference to the symbol of the Red Hand, which appears to have hitherto escaped notice:—

"Fuidis Muirne la Gleoir Lam-derg la ri Lamraige iardam, coni deiside in rad, Finn MacGleoir.

"Muirne afterwards married Gleoir (Gleor) of the Red Hand, King of the race of Hand, from which is Finn MacGleoir." This name Gleoir or Gleor is derived from an old Celtic word cognate with the root of the English glow, from Anglo-Saxon glowan, German gluhen, Norse gloa. Compare the Sanskrit word for the moon, kleda, glauh, and glaur; the Welsh llenad (lhenad from klenad), lloer (lheor from kleor or gleor), the Breton loar, and the Cornish lar. The Rev. S. Baring-Gould ("Curious Myths of the Middle Ages," p. 412) says—"The lightning-flashing cloud was also supposed to be a flaming hand. The Greek placed the forked dart in the hand of Zeus—

'rubente
Dextera sacras faculatus arces';

and the ancient Mexican symbolized the sacrificial fire by a blood-red hand impressed on his sanctuary walls."

J. F. LYNCH.

THE PARISH CHURCH OF THE OLD IRISH PARLIAMENT

By C. LITTON FALKINER.

(Copyright: All rights reserved.)

II.

Before entering into the history of the revived parish, it may be convenient to trace the subsequent history of the site of the earlier church and cemetery. For some time it remained derelict and unsaleable in the hands of the parish, which made more than one abortive attempt to dispose of it. On September 2, 1673, the Vestry considering that "the old churchyard in Dammas street was waste, and of no advantage to the inhabitants," ordered "that it be exposed to sale on the 4th day of November next, and that publicly in the church in the afternoon to all such persons, whether strangers or parishioners, as shall bid most for the same." But there was no bidder; and three years later it was arranged that Captain John Nicholas, "a worthy benefactor of the church," should have the use of the old churchyard in satisfaction for £150 due to him for materials supplied for the building of the new church, "provided always that he do not stir the corpse nor dig the ground otherwise than to level it." Nicholas subsequently obtained a formal lease of the ground, which was described as "all that piece or plot of ground lying and being in Dame street, in the parish of St. Andrew's, called the old churchyard, being by computation one hundred and twenty feet in length fronting to the said street, and about one hundred and twenty-one feet backward." The lease then given to Nicholas was some years later assigned to Alderman Sir William Fownes, an eminent citizen, whose memory is preserved in the street which bears his name, to whom the parish made a fresh lease for 41 years from 25 December, 1698, on the understanding that he was about to carry out large improvements. These improvements consisted in the formation of the Castle Market, which covered a part of the cemetery, and was opened in 1704. In 1717 Sir William Fownes "finding little advantage in his lease which obliged him not to dig any cellars or build great dwelling houses," applied for a new lease, and having obtained one on favourable terms, erected on the remainder a number of houses in Castle lane, now known as Palace street. The Castle Market was removed in 1782 when the Wide Street Commissioners began their operations, and a portion of the old cemetery of St. Andrew's is now daily trodden by the traffic of one of the busiest thoroughfares in Dublin.

The revival of the parish was coincident with that remarkable development of Dublin without its walls which followed the Reformation, and an outburst of prosperity which, after a long period of depression, led to a complete revolution in the appearance of the city. This will be best made clear by a glance at some of our old Dublin maps.

The oldest of these maps is that published by John Speed in 1610,* and from this we can form some idea of the aspect of the parish prior to its re-constitution. There was then but a single bridge over the Liffey, the old bridge which from Danish times had sufficed for the traffic between the north and south banks of the river. The Custom House stood south of this, at the end of Winetavern street, between Merchants' quay and Wood quay, and on the ground to the south from Essex or Grattan Bridge, and present Parliament street, which Essex street, Fleet street, Temple Bar, and Aston's quay now cover, were, with all the northern end of Westmoreland street, D'Olier street, and the adjacent neighbourhood covered with water. The only thoroughfare within the parish of any importance other than Dame street was George's lane, the modern South Great George's street, which dated from the thirteenth century, and the only buildings between this and Trinity College were the Bridewell and the village of Hoggen Green, on the south, and the Priory of St. Augustine and Cary's Hospital, to the north. In 1610, however, the street long called Chequer lane, corresponding with Exchequer street and Wicklow street, and forming the southern boundary of St. Andrew's, was designed, and in the peaceful reign of James the First suburban Dublin began to make some attempt at expansion. The movement, however, was checked in the stormy era of his successor, and from the days of Strafford to those of the Restoration scarce a brick was laid in Dublin. But no sooner had Charles the Second been restored than all was activity again. Within the space of half a century the single bridge had been multiplied by four, Essex bridge, the first and most important of the new ones, being almost contemporaneous with the revived parish of St. Andrew's. The Custom House was removed from the old site to the reclaimed ground close by, where it remained until near the close of the eighteenth century, while, as already noted, large mansions were built on the north side of Dame street. To the east, Lazy Hill was a sparsely occupied but growing district.

The succession of the clergy of St. Andrew's during the whole of its recorded history down to the Restoration, is, as already noted, identical with the succession of the Precentors of St. Patrick's; and even under the statute reconstituting the parish the Precentors retained the title, and some of the emoluments of Rector. Their names may be found by the curious in "Mason's History of St. Patrick," p. lxxi. But with the building of the church there opened a new, and, on the whole, distinguished line of Vicars, in whose persons it will be convenient to trace the later history of the parish. Of these the first was Dr. Richard Lingard, some time Dean of Lismore, and Professor of Divinity in the University of Dublin, whose memory and virtues have lately been recalled in one of the late Professor Stokes's charming lectures. Lingard, who was a Cambridge don, selected by the Duke of Ormonde as one of the Fellows of Trinity College on its reconstitution after the Restoration, was named in the Act of Parliament as the first Vicar. His selection may, perhaps, be held to indicate a desire on the part of the ecclesiastical authorities to associate Trinity College with the parish in which it lay; but he can have had little active connection with St. Andrew's. His name only appears once in the Vestry Books; and he died in November, 1670, long before the completion of the church, which was not opened for some years later.

Lingard was succeeded by, perhaps, the most celebrated divine in the roll of the Vicars of St. Andrew's, the well-known Anthony Dopping, successively Bishop of Kildare and Meath; a prelate remarkable not only for the independence he exhibited in the troubled period of the Revolution, but for his numerous theological writings. From the date of his appointment, in 1670, to his elevation to the

TRINITY COLLEGE

AS IT WAS TWO CENTURIES AND A HALF AGO.

Episcopate, Dopping proved a vigorous parish clergyman. He evinced the keenest interest in the affairs of his charge, advancing money from his own purse for the building fund, and zealously upholding the rights of the parish, Of his energy in this respect, as well as of his antiquarian knowledge, the vestry books contain an interesting illustration, which, though scarcely reliable in detail, incidentally throws a valuable light on this ancient state of the district.

St. Andrew's had been amalgamated at the Reformation, as already stated, with the adjacent parish of St. Werburghs, a church, like itself, of great antiquity, and of Danish origin. It is scarcely surprising that when, after the lapse of above a century, St. Andrew's regained its independence, some difficulty should have been experienced in determining the bounds of their respective districts. A somewhat angry controversy arose upon the claim of St. Werburgh's that the bounds of St. Werburgh's parish "do extend without the Dammas Gate on both sides of the way, unto the watercourse that runs through the Castle Yard (the Poddle), and so along by the Horse Guard, and then empties itself at the end of Essex street into the Liffey." The claim of St. Werburgh's, which on reference to the arbitration of the Archbishop of Dublin was ultimately substantiated, rested upon an order of Vestry dated August 22, 1574—just a century earlier—which established, with the concurrence of the parishioners of St. Andrew's, that the watercourse just mentioned formed the boundary of the parishes. Dr. Dopping, however, strenuously resisted the claim, and in an elaborate "Account of the Rights of St. Andrew's Parish"* adduced a variety of testimony in support of his side of the question, in the course of which he made the following interesting assertions as regards the topography of this part of Dublin, which, though scarcely well founded, have the merit of suggestiveness:—

"Supposing it be true that the watercourse was the boundary, the query still remains whether the watercourse be not altered, and the current directed another way, since it appears out of the Chronicles and History of Ireland—(1) That the sea did anciently flow up as far as Ship street, where it met with the stream that came down under Powle-gate Bridge; (2) that boats have passed about the city walls as far as Newgate; (3) that it is not very long since the ground (where now the Council Chamber and Essex street stand) was a perfect strand, and recovered from the sea by Jacob Newman, from which the Earl of Stafford after bought it for the King's use; (4) that the watercourse did anciently run close to the town and Castle walls, and from thence it passed under Dammas Bridge, and so emptied itself into the Liffey; (5) I do find further by perusal of ancient history that, before the city walls were built, and for some time after, the water ran round the city of Dublin, and it had large trenches about 20 yards broad; (6) the plot of ground on which the Dammas Mills now stand was anciently called Insula de la Dames, which supposeth a double watercourse encompassing it."

In 1674, during Dopping's incumbency, the new church was completed and opened for public worship. The pewholders included, as appears from the Vestry Books, a number of the most influential residents in Dublin. Among them were the Lord Mayor of the city, who had a seat allotted to him officially; Primate Margetson, the Countesses of Clancarty and Mountrath, Dr. Jones, Bishop of Meath, by whom the site had been presented, and to whom a burial vault was alotted; and Sir James Ware, the Auditor-General, and son of the well-known antiquary and historian.

Dopping was elevated to the Episcopal Bench in 1678, and was succeeded in his vicarage by Michael Hewetson, subsequently Archdeacon of of Armagh, and author of a curious little work entitled "A Description of St. Patrick's Purgatory." Hewetson's tenure of this incumbency lasted for fifteen years, and covered the troublous period of James II. reign and deposition. An entry in the Vestry Book in Dr. Hewetson's handwriting indicates the apprehensions felt for the safety of the Church while King James's Parliament sat. It relates to the Church plate, and sets forth how the silver plate belonging to St. Andrew's Church, consisting of eight pieces, were "in the late troublesome times committed to the Rector's care. Two of these pieces, a pair of patens, still form part of the Church plate, and bear the inscription, "Preserved in '89-90."

Dr. Hewetson's successor was Dr. John Travers, who, curiously enough, had occupied the position to which his predecessor at St. Andrew's succeeded, of Archdeacon of Armagh. During the space of twenty-four years he ministered in the parish, to which he was a generous benefactor, and the period was signalised by important changes. He (Dr. Travers) built at his own expense an almshouse for widows, and girls' school, which was erected on the site, between Trinity street and Exchequer street, purchased from Trinity College, on which Trinity Hall, the original College of Physicians had formerly stood. Travers was also a generous benefactor of the parish in his will, and he manifestly enjoyed the warm affection of his flock. The minutes of the Vestry for February 25, 1694, the year following his appointment, contain a curious entry, which proves that this 17th century Vicar was not untroubled by ritualistic controversies. It sets forth "a complaint against Mr. Travers maliciously forged and delivered to his Grace the Archbishop of Dublin," of which the principal allegations were that Divine offices were not performed, nor the Sacraments administered with sufficient diligence; that sermons were not preached on Holy Days, nor a surplice worn by the minister on such days, and that several rubrics formerly observed were neglected by Dr. Travers. These charges, which appear to have been instigated by Dr. Hewetson, were indignantly repudiated by the Vestry, who, after eulogising Dr. Travers,' "reverent, devout, and diligent performance of his ministerial duties," proceeded to evince the evangelical colour of their Protestantism, by declaring that while the complaint was for the most part false, "in whatever instance it is true, we are much better pleased with the alleged omissions than with the unnecessary overdoings in the late Vicar's time."

But by far the most important event in Dr. Travers' incumbency was the severance of what is now St Mark's from its parent parish. We have seen how in 1665 the district of the Stane or Lazar's Hill had been formally added to St.

*Dopping's account has been printed by Sir John Gilbert in his "History of Dublin."

Andrew's. All that time it was but thinly populated, and made no extravagant demand on the energies of the minister. But, as a glance at Brooking's map is sufficient to show it had undergone in the interval a great expansion, and houses had everywhere sprung up. Accordingly, it was thought desirable to relieve the old church of this charge, and by an Act of Parliament passed in 1708, which recited that the vicarage or parish of St. Andrew's was too large for its church, it was enacted that after the death, surrender, or promotion of Dr. Travers the parish should be divided, and that a parish to be called the parish of St. Mark's should be constituted, and a church erected on a site presented by one John Hansard of Lazy Hill. Thus the parish of St. Andrew's reverted to its original dimensions, and thenceforward it has undergone no change. Dr. Travers survived this partition by twenty years, dying in 1727, and leaving by his will substantial bequests to the parish He had held, in addition to his vicarage, the Chancellorship of Christ Church Cathedral.

(To be Continued.)

TWO POEMS ON THE HOLY WELLS.

[With the exception of Philip Hardy's "Holy Wells of Ireland," which is merely an onslaught on the popular devotion to these interesting relics of the past, it is curious that there is no reliable work dealing with the Irish Holy Wells, while those of England have been written on by Mr. St. John Hope; and the Holy Wells of Cornwall have also had their historian, both of whose books are still in print. Mr. St. John Hope, in fact, began a series of papers on the Irish Holy Wells in the "Antiquary," but has not continued the subject so far. The poem on the Irish Holy Wells, by J. De Jean Frazer is more or less a familiar one; but the following two—the first by the late Sir William Wilde, and the second by Mrs. Kevin Izod O'Doherty ("Eva" of the "Nation"), are not so well known to Irish readers.]

BY SIR WILLIAM WILDE.

Thou chosen spring of sacred gift,
By prayer and penance blest,
Here on thy knee-worn margin
My wanderings find a rest;
I could not pass thee heedlessly,
Or deem with scoffing thought,
That God had through thy hallowed drops
No healing wonder wrought.

With solemn pause I gaze upon
Thy surface calm and pure,
Recalling days when simple souls
In faith found simplest cure;
Who knows thou art unsanctified
And hast no salving power
Let me, at least, revere thee now
In thy departed hour.

BY MRS. KEVIN IZOD O'DOHERTY.

Oh, lonely, silent, crystal well,
Thy stilly waters gleam
From out the shaded emerald dell
As in a tranquil dream;
No voice to break the solitude
But low winds wailing tune—
As though the night above thee hood
The wild bird and the moon.

Within thy charmed silver ring
What precious memories sleep!
The faith and hope that fondly cling,
The love and sorrow deep—
Sad smiles that tell the sad heart's tale,
Sweet tears that softly fall;
Like winter sun and summer rain,
Thou hast them treasured all.

The gnarled oak-tree droops above
As pilgrims watch and pray
With uplifted arms of reverent love
Through ages dim and gray;
Upon its seamed and grisly bark
Lov'd names have once been traced.
But now the eye can scarcely mark
Those records half effaced.

The moss and lichen idly creep,
The ivy tendrils twine:
Of characters, once fresh and deep,
New growth scarce leave a line;
And thus it is, with loved one's names
Once writ upon thy heart,
When time brings forth new hopes and aims,
And bids the past depart.

ANCIENT IRISH SOCIETY.

By M. J. BYRNE.

Dr. Montgomery Hitchcock has done a genuine service to antiquarian research by focusing it upon so extremely interesting a subject as ancient Irish society. This subject is still an almost unexplored branch of learning for the invaluable lectures of Professor O'Curry touched only the fringe of the subject, and the labours of the folk-lorists are open to cavil as being largely speculative.

With regard to Dr. Hitchcock's reading of the much disputed and obscure Geilfine system. I trust Mr. Ginnell and others who have devoted intelligent and careful study to the matter will contribute to your journal their views also, in the hope that wisdom may speak out of many mouths. I confess that I am unable myself to spell out the meaning of the law tracts dealing with this obscure subject, or to follow the deductions of the editors of the third volume of the Ancient Laws of Ireland, Sir H. S. Maine, Dr. Sullivan, Mr. M'Lennon. Professor Richey, and last, though not least, Mr. L. Ginnell, whose little work on the Brehon Laws is the most excellent treatise on the whole subject I have met. It seems to me that each of these learned contributors have simply succeeded in overthrowing the theories of the other, but have not been at all so successful in their constructive criticism as they have been in their destructive.

I think Dr. Hitchcock is in error in thinking the chief was entitled to force stock on the clansman and so secure him in a species of vassalage.

The Senchus Mor expressly lays it down—"The law does not require of a man to accept of daer-stock tenure from his own chief or from an extern chief, or from his own king or from an extern king; but the law requires of him to take saer-stock tenure from his own king. It does not require him to take daer-stock tenure from his own chief or from an extern chief, or from an external king. If he take daer-stock tenure it should be from his own king." (Ancient Laws of Ireland (Brehon Laws), II., 223-5. As I understand the laws, there were only two ways of procuring cattle—by what is called saer-stock and daer-stock tenure. The word "tenure" is apt to mislead anyone acquainted with our present laws, because there was no such thing as "tenure" in the old Irish land system. Now, saer-stock was taken by free-men, and implied no kind of vassalage. Daer-stock did imply some sort of vassalage. And as I read the law, it means that no clansman could become the vassal of a foreign chief without his own chief's consent or default to supply stock; and as to taking saer-stock, it was a kind of protective system to secure that, as far as possible, the dealings in stock be confined within each king's dominions. A sort of ancient beef-trust!

I imagine the division into classes referred to by Dr. Hitchcock was more theoretical than real. We have, for instance, dukes, marquises, viscounts, earls, barons, baronets, knights, esquires, gentlemen, and yoemen. The Heathen Chinee might misunderstand these as so many distinct classes, which in one sense they are. But I am inclined to think that, as with us there are only two classes—Lords and Commons—so with the ancient Irish there were also only two classes, which the editors of ancient laws, for want of a better term, describe as the free and non-free classes.

As within the peers we have different ranks of duke, marquis, viscount, earl, and baron, so in ancient Irish society there were different ranks, but these were merely, as we would say now, "social" distinctions—using "social" in a narrow sense.

The reference to classes in the laws would seem to be rather speculations of the old writers of these tracts, and not to be part of the laws themselves.

I take it, "seventeen" is a typographical error for "seven," which was the number of ancient classes stated by the Crith Gabhlach (Ancient Laws, iv., 299).

I think it is a mistake to assume there was no such thing as individual property. When the Plantation Commission went into Ulster after the flight of the Earls, Sir John Davies (one of the Commissioners) tells us they found that in a manner every acre had its owner. The laws deal with forfeiture of land for crimes; with hereditary and purchased estates; with fences, gardens, houses, and so on, which would have no meaning if there were no such thing as private property.

The laws provide for a man's leaving his tribe and becoming naturalised in another tribe, and were in this respect exactly similar to the laws of all civilised States at this day. These laws seem to have escaped Dr. Hitchcock's notice.

I am not sure that the clans are properly described as leading a roaming life. All the chiefs had fixed residences, and there are elaborate rules as to the extent of their lawns and right of sanctuary. No doubt, the herds went out to mind the cattle in the mountains, but if we may judge from the instance of St. Patrick, these would generally be either slaves or serfs of some kind.

Of course, each clan's territorial limits were defined, and whatever migrations they indulged in had to be circumscribed by these limits.

The manners and customs above referred to are those evidenced in the Brehon Laws, which themselves refer to pre-existing organisation, and as the Brehon Laws date back to the time of St. Patrick, and we have no written memorials of an earlier age, it will, I presume, be admitted that any state of society older than that presented by these laws, is a mere matter of speculation, and one without any solid foundation in extant historical records. Glimpses of our civilisation may, of course, be spelled out of allusions in our annals and historic tales. We find, for instance, the Feis of Tara; the use of gold and metals; the rule as to blemishes disqualifying for high office; the existence of Brehon jurisdiction, and the like, but these are too meagre details from which to reconstruct ancient society.

I trust the subject opened by Dr. Hitchcock will attract many contributions from those best qualified to deal with a subject requiring assiduous and extensive reading and careful and skilful thought.

BOOKS.

A perfectly honest and respectable blockhead asked me recently: "What is the use of books for men working for their daily bread, or for young fellows whose first business in life is to make some way in the world?" From the highest class in the nation to the humblest, good books are the salt of life. They make us wiser, manlier, more honest, and, what is less than any of these, more prosperous. It is not the least of their merits that good books make manly men and patriotic citizens. To love noble books is to share with statesmen and philosophers the pleasure on which they set the highest price. Time has made trite and commonplace the great saying of Fenelon: "If the crowns of Europe were laid at my feet in exchange for books and the love of reading, I would spurn them all." Our own Goldsmith declares that taking up a new book worth reading is like making a new friend; a friend from whom we will never be separated by any of the melancholy mischances on which human friendships are so often wrecked. But good books will do more than this—they will awaken all that is best in our nature, and teach us to live worthier lives. They will do for us what we rarely permit the closest friend to do—they will teach us our faults, and how to amend them.—Sir C. G. Duffy.

IRISH ARCHÆOLOGICAL AND LITERARY SOCIETIES, ETC., PAST AND PRESENT.

BY M.R.S.A.I.

In "A Magazine of Art, Archæology, Literature, and Science," such as the new "Dublin Penny Journal" claims to be, it can hardly be deemed superfluous to furnish a short notice of the various societies, past and present, whose aim and object was, and is, to perpetuate and add to our knowledge of Irish Art, Archaeology, Literature, etc—more especially as there is in the case of some of these societies, at least, a more or less unconscious tendency to confine their records and work to members only.

Of the oldest established Irish archæological bodies, the Royal Irish Academy, whose priceless collections of literary works, manuscripts, etc., are easily accessible to Dubliners, in Dawson street, not much need be said here, except that it still publishes its "Proceedings" regularly, to which one of the most frequent contributors is Mr. Thomas Johnson Westropp, one of the most indefatigable of living Irish archaeologists, whose antiquarian knowledge of the County Clare especially, is unsurpassed. In the year 1740 was founded the Physico-Historical Society, under whose auspices were published Dr. Charles Smith's Histories of Waterford, Kerry, and Cork. In 1752 was founded in Dublin, the "Committee for Antiquities" or "Irish Society," for the publication of Irish tracts, but failed in its object. In 1782 General Vallancey, an Englishman of Huguenot extraction, brought out his "Collectanea de Rebus Hibernicis," which attracted much attention to Irish antiquities, etc., and led, through Edmund Burke, to the acquirement by Trinity College, Dublin, of such famous Irish manuscripts as the "Book of Leinster," the "Brehon Law Commentaries," etc. When the Society of Antiquaries which Vallancey founded became extinct, the Royal Irish Academy came into existence, but as its attention was devoted principally to science (as is still, in part, the case) the Gaelic Society was formed, but only produced one volume. After this came the Archaeological Society. In 1818 arose the Iberno-Celtic Society, which published O'Reilly's "Writers of Ireland." In 1840 the Irish Archaeological Society was formed; and in 1845, the Celtic Society, which were amalgamated later on. Between these two societies some twenty-seven volumes, treating of Irish history, etc., were brought out, whose titles are easily obtainable, all of which now fetch high prices. The Celtic-Archæological Society is no longer in being, but its work was to a great extent carried on by the late Sir John T. Gilbert, whose valuable publications appeared in similar book form. In 1851 the Society for the Preservation and Publication of the Melodies of Ireland was formed, with the object of publishing Dr. Petrie's collection of Irish music, but that, too, proved a failure. At the present time, however, an effort is being made to realise its purpose.

On St. Patrick's Day, 1853, the Ossianic Society for the Preservation and Publication of Manuscripts in the Irish Language, illustrative of the Fenian Period of Irish History, was founded. It could boast of 746 members, published six volumes, but in its eighth year the Ossianic Society suddenly died out.

Founded so far back as 1849, as the Kilkenny Archaeological Society, and known later as the "Royal Historical and Archaeological Association of Ireland," the "Royal Society of Antiquaries," Ireland, its present title, forms the largest, most popular, and most widespread of existing Irish archaeological societies, thanks for the most part to the untiring yet unobtrusive efforts of its hon. secretary, Mr. Robert Cochrane, whose admirably organised periodical excursions to various parts of Ireland have done so much to extend this society and further its aims. It is now publishing the index to the first fifty volumes of its journal, which appears quarterly, and is well worth the ten shillings which forms the annual subscription to the R.S.A.I., which has its headquarters at 6 St. Stephen's green, Dublin, where many of its archaeological treasures, photographic collections, etc., are to be seen.

In the same building has its home the National Literary Society, whose able president is the veteran writer, Dr. Sigerson. This society provides admirable lectures at frequent intervals, and has just issued the third number of its journal (published by O'Donoghue and Co., Dublin). Of kindred Dublin societies, there are the Pan-Celtic Society, which issues a periodical called "Celtia"; the Society for the Preservation of the Irish Language (6 Molesworth street), the Gaelic League, which publishes monthly the "Gaelic Journal," and a weekly paper called "An Claim Soluis," printed mainly in the Irish language, and has its annual triumphal heyday in the Oireachtas, whose object is the spread and encouragement of Irish literature, songs, musical effort, etc.; and the Feis Ceoil Society, which has Irish music and song as its special scope.

The Kilkenny Archaeological Society had a rival, if not forerunner, in the South Munster Antiquarian. It probably led, too, to the foundation of the Ossory Society by Bishop (now Cardinal) Moran, on whose removal to the Antipodes the Ossory Society, which published some very interesting volumes of Transactions, came to an end.

The South Munster Antiquarian Society numbered amongst its members all the Cork archaeologists of that day, and was famous for its antiquarian rambles. Its work is now continued, in a measure, by the Cork Historical and Archaeological Society, whose operations are confined exclusively to the publication (at first monthly, but now quarterly) of its "Journal." The Cork Cuvierian Society is no longer in being, but the Cork Literary and Scientific Society can lay claim to a long and honourabe career. Cork has, too, a Natural History Society. For its size no other Irish town possesses so old an institution as does Queenstown, whose Great Island Literary Society was formed so far back as 1834. Waterford had at one time a Literary Society now a thing of the past, but has still its Archaeological Society, founded by the Most Rev. Dr. Sheehan, to whom the Cork Society also mainly owes its existence. This Society publishes a "Journal" quarterly, but does not seem to meet with the support which it so well merits.

Almost simultaneously with the Waterford Society was established the Kildare Archaeological Society, whose "Journal" comes out every half year, the principal contributor to which is Lord Walter Fitzgerald.

To Colonel Vigors, of Holloden, Bagenalstown, county Carlow, belongs the credit of forming the Society for the Preservation of the Memorials of the Dead in Ireland, whose "Journal" now appears twice a year, and ought to find many more subscribers than it has.

In Limerick the Naturalist Field Club embraces archaeology, which occupies no small share of its annual volume, published by Guy and Co., Limerick.

Galway has lately set up in its midst a much needed Archaeological Society, whose "Journal," judging by its three issues, is highly creditable to it.

As is the case with the Limerick Naturalists' Field Club, the far older Belfast Naturalists' Field Club, takes in archaeology also in its programme, and is famous for its numerous antiquarian outings, which are reported in the local Press, and appear likewise in an annual volume of rather meagre proportions of late years. This last circumstance is probably due to Belfast's possessions of the revived "Ulster Journal," a most readable quarterly production, which owes much to its able, enthusiastic, and ubiquitous editor, Mr. F. J. Bigger, Belfast.

Ireland, too, has an increasing number of school, college, convent, and parish magazines, which foster in their way literary effort and achievement, a complete list of which would be desirable.

To special subjects, such as Irish local printing, a few Irishmen have devoted their attention, notably Mr. E. R. M'Clintock Dix, 2 Pembroke road, Dublin, whose exhaustive contributions in that line are to be found in the Cork, Waterford, Ulster, etc., journals, besides several privately-printed brochures on Strabane, Armagh, and Early Dublin Books, etc.

The Irish Texts Society has its headquarters in London, and has already brought out several valuable volumes, and promises three during the current year. Under the same roof, St. Ermin's Hotel, Westminster, London, flourishes the Irish Literary Society, which forms a much-needed centre for the Irish in London, who have not grown indifferent to the history, literature, etc., of their native land. In its hon. librarian, Mr. James Buckley, it possesses an assiduous contributor to the Cork and other Irish archaeological journals.

No paper treating of recent Irish literary and archaeological progress and work would be complete if we left unnamed that fascinating little volume "The Irish Literary Revival," published by its author, Mr. W. P. Ryan, London, in 1894, a book that should have long since ran through several editions; and such works as Dr. Hyde's Literary History of Ireland, The Story of Early Gaelic Literature, etc. Still less would it be just to omit reference to such foreign publications as the "Revue Celtique," "Zeitschrift fur Celtiche Philologie," "Irische Texte," etc., which are to be had of Mr. David Nutt, Long Acre, London.

Whatever errors or omissions that may occur in the present paper will, it is to be hoped, be rectified by those interested in a subject that appeals to all Irishmen without exception—viz., the archæology, literature, etc., of their native land. P.S.—The Irish Literary Society publishes a quarterly gazette, and the New York "Gael" forms a cheap and excellent antiquarian monthly.

THE SOUL'S SORROWING.

Not for the good denied her
The Soul laments to-day,
Not for the flowers that faded,
The stars that might not stay;
The empty hands grope darkly
For the gifts they cast away.

OLD WORLDS AND NEW ONES.

We must look to the solar system for examples of stars in the last stage of development. Each of the planets may in fact be regarded as an object of this kind. The bare and rocky surface of the moon affords a desolate picture of what may result from the long continued process of condensation. The volcanic region gives no evidence of the existence of life—in fact, the spectroscope indicates that if there is any air on the moon, it is much too rare to support life as we know it.

Fortunately the moon is not the only example of a wornout star. The earth, which probably has many counterparts in the universe is another example of a less desolate kind. Here, though the process of condensation, which is the chief cause of celestial phenomena has ceased, the problem of evolution has not ended. In fact, though the cosmical problems which we have considered in their barest elements will not be completely solved for centuries, it may be truly said that the questions raised by the countless living organisms in a single drop of ditch water are still more complex and will require a little longer time for their solution.

WATERFORD CITY.

Its History, Antiquities, &c.

From Lewis's "Topographical Dictionary of Ireland."

The city first received a charter of incorporation from King John, who, on the 3rd of July, 1205, granted the city, with its port and all its appurtenances, to his citizens of Waterford, with murage and all free customs, liberties, and privileges enjoyed by the burgesses of Bristol. Hen. III., by repeated writs to the Archbishop of Dublin, and to his Lord Justiciary of Ireland, confirmed this grant; and in the 16th of his reign, by a new charter, granted the whole of the city to be held by the citizens at a fee-farm rent of 100 marks, with exemption from toll, lastage, pontage, passage, and other immunities. Edw. II., in 1309, confirmed the preceding charter, and in 1310 granted the citizens certain customs for seven years, to assist them in fortifying the town. Edw. III., by writ issued in the 2nd of his reign, directed that the mayor should be annually elected by the citizens, and sworn in before the commons, unless the Lords Justices, or one of the barons of the exchequer, might be in the city at the time. The same monarch, in the 30th of his reign, confirmed by charter all previous grants, and in the 38th and 45th extended the privileges of the port; in 1377 he granted the custom called Cocket, for ten years, to the citizens, for the repair of the quays and enclosing the city. Rich. II., in 1380, confirmed the charter of Hen. III., and in the following year granted the corporation licence to sell wine, and in 1385, all the customs of things sold here for 24 years, to be expended on the fortifications of the city. Hen. IV. confirmed all previous charters, and also granted certain annual sums from the cocket, for strengthening the walls; and Hen. V. confirmed all previous grants made by his predecessors, and by charter, in the 1st of his reign, appointed the mayor the king's escheator; to have, with the commons, cognizance of all pleas of assize, and other privileges and immunities, which were confirmed by Hen. VI. in the 20th of his reign, who also granted £30 per ann. from the fee-farm rent, to be applied for 30 years to the repair of the walls and fortifications. Edw. IV. granted the citizens a charter, conferring some additional privileges, among which was that of bearing a sword before the mayor; and Hen. VII. granted the mayor and corporaton the power to have a gallows and a prison, and appointed the mayor and bailiffs justices for gaol delivery in all cases of felony, treason, and other crimes. Hen. VIII., Edw. VI., and Mary, severally granted confirmatory charters; and Elizabeth, in the 9th of her reign, by letters patent, granted the privilege of electing the mayor and bailiffs annually, and of choosing a recorder, town-clerk, sword-bearer, and various other officers. In the 16th of her reign, Elizabeth granted the citizens a new charter, constituting the city, with all lands belonging to it, a county of itself, under the designation of the city and county of the city of Waterford, ordaining that the corporation should consist of a mayor, two sheriffs, and citizens; and by another charter in the 25th of her reign, the same queen granted to the corporation the lands of the grange, Ballycrkeele, and the new town adjoining Waterford on the south

CORPORATION SEAL.

side (containing 100 acres), with the abbey of Kilkellen and its demesnes on the north side. In the 5th of Jas. I., the citizens, who had refused to proclaim that monarch's accession to the throne, were served with a writ of Quo Warranto, to which they pleaded the several charters previously enumerated; and their plea with some small alterations and omissions, as "by the king's privy council were thought fit," was allowed; and the charter having remained in the hands of the monarch, as forfeited, was, after a disclaimer by the citizens in a Quo Warranto, restored by patent under the great seal of England, on the 26th of May, 1626, in the 2nd year of the reign of Chas. I. This charter was explained and amended by a supplementary charter granted by the same monarch in 1631, and is now the governing charter. It confers upon the mayor and council the returns of assize, precepts, bills, and warrants, the summons and escheats of the exchequer, and the precepts of itinerant judges; a grant of the city and various lands; with all other possessions of which it had formerly been seized, to be held for ever in free burgage at the usual rents; a grant of the site and precincts of the abbey of Kilculliheen, with all its possessions and numerous parsonages, to be held in fee-farm at the rent of £59 1s. 8d. per annum. The same charter granted also to the corporation, for ever, the harbour of Waterford, from the entrance between Rodgbank and Rindoan to Carrigmagriffin, and as far as the sea ebbed and flowed, with all its waters, soil, and fisheries; the office of an admiralty and an admiralty court, reserving to the Lord High Admiral of England and Ireland all pirates' goods and wrecks of the sea; the power of taxing the inhabitants for all public charges and works; of forming themselves into guilds and fraternities, similar to those of Bristol; of taking murage custom, and of having a corporation of the staple and two constables; of holding courts or councils, once every week, for the conduct and government of the orphan children left to their charge by deed or will; of receiving the cocket customs and half the prisage of wine, together with all waifs, strays, felons' goods, and deodands, and of having a gaol under the custody of the sheriffs, and many other privileges.

Under this charter the government of the city is vested in a mayor, eighteen aldermen, eighteen assistants, a recorder, and two sheriffs (who altogether constitute the common council); a coroner, clerk of the crown and peace, a town-clerk, notary public, mareschal, water-bailiff, searcher, gauger, sword-bearer, four sergeants-at-mace, constables, and other officers. The mayor is chosen from among the aldermen annually on the Monday after the Visitation of the Blessed Virgin, by a majority of the common council, and sworn into office before his predecessor, or, in his absence, before the council, on the Michaelmas-day following. The sheriffs are chosen at the same time from among the assistants, by which body the recorder is appointed; all the other officers of the corporation are chosen by the mayor and council, except the sergeants-at-mace, who are appointed by the mayor and sheriffs. The mayor, the recorder and the four senior aldermen are justices of the peace within the city and the county of the city, and also within the county of Waterford. The freedom of the city is inherited by birth, and obtained by marriage with a freeman's daughter, or by apprenticeship to a freeman; the citizens are exempted from all toll, lastage, portage, pontage, murage, and other duties throughout the realm. The city first sent members to parliament in the year 1374, apparently by prescriptive right, as no grant of the elective franchise is found in any of its charters; from that period it continued to send two members to the Irish parliament till the Union, from which time it returned only one to the Imperial parliament, till the passing of the act of the 2nd of Wm. IV., cap. 88, which restored its original number.

The county of the city, from the peculiar situation of the town on the northern confines of the county of Waterford, is made to include a portion of land on the north of the river Suir, which formerly belonged to the county of Kilkenny; and by the charter of Chas. I. comprises the great port and river up to Carrick, that part of the county of Kilkenny which is contained in the parish of Kilculliheen, all the lands on the opposite bank of the river in the parishes of Kilbarry and Killoteran, and the town of Passage; comprehending together, according to the Ordnance survey, 9,683 statute acres, of which about 882 acres are occupied by the city and suburbs; the amount of Grand Jury cess, in 1835, was £4,928 9s. 7½d. The rural districts present no peculiarity of character; the northern part chiefly consists of high grounds, commanding fine views of the city; and on the opposite side, especially on the banks of the river above the city, are some elevated lands, except near the course of John's river, where there is an extensive level of marshy land. The prevailing substratum is agrillaceous

schistus, with silicious breccia near the summits of the hills, over which red sandstone frequently occurs; sienite and hornblende are found at Kilronan, talcous slate near Knockhouse, lydian stone on the road to Annestown; hornstone and jasper, alternating with flinty slate, in the same neighbourhood; and serpentine, resting on a blueish black quartoze rock, at Knockhouse. The face of Bilberry rock, over the river Suir, above the city, presents a very interesting section, in which, in addition to the above-named minerals, are veins of quartz, comprising a considerable quantity of micaceous iron ore and scalygraphite, both passing into oxyde of iron and jasper, and in some places forming, with the quartz, a beautiful jaspery ironstone; brown crystallised quartz, with minute crystals of chlorite; red ochre in abundance, sulphate of barytes, oxyde of titanium, bituminous shale, talcous slate, and arsenieurate of iron.

Of the ancient walls of the city, which appear to have enclosed a triangular arena of about 15 acres, with a tower at each angle, there are still some interesting remains; they were extended in the reign of Hen. II. by a considerable sweep towards the west, and their circuit was farther enlarged in that of Hen. VII., when they were repaired. Of the original towers, the only one perfect is Reginald's tower, in the old documents frequently called Reynold's tower and the King's tower: it was rebuilt in its original style in 1819, and is now appropriated by the corporation as a barrack for the police establishment. St. Martin's Castle, which was situated at the western angle of the city walls, has been partly preserved by its connection with a private dwelling-house, long called "the Castle." On the land side the city had five gates, of which St. John's was for a long time used as a county prison. There were also, in addition to the regular fortifications of the city, several private fortresses, called by the names of their respective proprietors, and supposed to have been not less than 20 in number. In Colbeck Castle, from which that street took its name, was the Chamber of Green Cloth, or Chamber of Waterford, sometimes used by the mayor as a place of confinement for refractory citizens; and a few years since there were several Danish semilunar towers on the walls, of which only one is now remaining at the extremity of what are called the ramparts. The palace in which King John resided, during his stay at Waterford, occupied the site on which the Widows' Apartments were built, and on the erection of which the vaults and foundations of that ancient structure were discovered. The most ancient of the religious houses was the priory of St. Catherine, founded by the Ostmen for canons of the order of St. Augustine and of the congregation of St. Victor: its endowment and possessions were confirmed by Pope Innocent III., in 1211; from the terms of that confirmation it appears to have been insulated at that time; in the 31st of Elizabeth, its revenues were granted on lease to Elizabeth Butler, otherwise Sherlock. The ancient abbey was situated to the south-west of the city, adjoining Lombard's marsh, and a great part of the building remained in tolerable preservation till a few years since, when it was levelled to open a way to the bridge then built over John's river; a vaulted room and a small portion of the foundations are all that now remain. The priory of St. John the Evangelist was founded in the suburbs, in 1185, by John, Earl of

MAYOR'S SEAL.

Morton, afterwards King of England, for monks of the order of St. Benedict, and made a cell to the abbey of St. Peter and St. Paul, in the city of Bath. This establishment received many grants and charters from successive English monarchs, and at the close of the 15th century had vast possessions and enjoyed ample privileges, among which was the right of holding a court baron within the parish of St. John. The manor of St. John, now the property of Thomas Wyse, Esq., was for a long period held under the priors of that house by his ancestors: at the dissolution, in 1537, it continued in the possession of the family, and was subsequently confirmed in capite at two knights' fees, with all tithes, privileges, royalties, and immunities, by royal charter, to Sir William Wyse, then chamberlain to Hen. VIII., which grant was more fully confirmed by patent in the 15th of Elizabeth. A monastery for Dominican or Black Friars, called also Friars Preachers, who were introduced into Ireland in 1226, was founded by the citizens, who for that purpose applied to Hen. III. for liberty to erect their house on a piece of ground adjoining Arundel's castle, and on which stood the ruins of an ancient tower. This establishment continued to flourish under the patronage of several monarchs, and at the dissolution the buildings, which were very extensive, but in a ruinous condition, were granted in capite, with some parcels of land, to James White, at an annual rent of 4s. The only existing remains are the chancel of the church and the belfry: the entrance to the former is through an arched doorway, highly ornamented with rope mouldings and surmounted by a spacious window; the interior consists of two apartments, which are low and gloomy, with vaulted roofs supported on groined arches; the belfry is a lofty, square tower of massive thickness, having a staircase leading to the summit, from which is obtained an interesting view, especially over the old portion of the city. A monastery for Franciscan Friars, or Friars Minor, was founded in 1240 by Sir Hugh Purcell; at the dissolution it was purchased by Henry Walsh, who established on its site the hospital of the Holy Ghost, before noticed. There are remains of two houses of the Knights of St. John of Jerusalem, situated respectively at Killure and Kilbarry, near which last is also a cromlech. In Arundel square was anciently a college of Jesuits, of which there are still some small remains. Of the old parish churches, the only one of which any part remains is that of St. Thomas, supposed to have been erected by Hen. II., or by his son and successor, King John, and was dedicated to St. Thomas á Beckett: part of the entrance is still entire, and displays a beautiful specimen of Norman architecture. In Her Majesty's State Paper Office is lodged a curious manuscript history, in verse, of the municipality of Waterford, supposed to have been written in the time of Hen. VIII., and of which a printed version is given in Ryland's History of Waterford. Among eminent natives may be noticed Gotofield, a learned Dominican friar of the 13th century; William of Waterford, author of a polemical work, published in 1433; Peter White, a celebrated classical teacher, and author of several publications, in the reign of Elizabeth; Nicholas Quemerford, D.D., cotemporary with the above, and author of "Answeres to certain Questions propounded by the citizens of Waterford," and other works; Peter Lumbard, R. C. Archbishop of Armagh, and a learned writer, who died in 1625 or 1626; Peter Wadding, a learned Jesuit, highly esteemed for his piety, who died in 1644; John Hartrey, a Cistertian monk, who wrote the history of his order in Ireland; and Luke Wadding, Franciscan friar, born in 1588, who also compiled the annals of his own order. Waterford gives the title of Marquess to the family of De la Poer Beresford.

[THE END.]

SABBATH DAWN.

In the soft mist the trees at worship stood,
The bush in reverence bowed its jewelled head,
Like ghosts at prayer, cobwebs bestrewed the grass:
No bird-song broke the hush of early morn,
Nor insects' chant, that fainting dies at dawn,
When the silence came the strident crow
Of chanticleer irreverent, and the Night
Died by the shafts of Day. The living light
Bore the dead darkness hence, and as it passed
Lighted the gladiolus flame
Before the altar of the flowers.

THE SCIENTISTS' DEBT TO FRANKLIN.

Benjamin Franklin was one of the most earnest and tireless of scientists. His discoveries are classed among the most remarkable of his age. They were extensive and brilliant as they were deep and mysterious. He outran the most celebrated English electricians in the race for new discoveries. He gave form and dignity to the science of electricity, and raised the science to a high rank among the most useful and distinguished and also gav it a philosophic standing second to none of the discoveries of the eighteenth century. To Benjamin Franklin are due many of the most useful discoveries in electricity. His clear eyes of prophecy saw the glorious triumph of his favourite science, and somewhere he may be watching the grand illuminations resulting from his successful efforts in bottling a flash of lightning. He was the first man to succeed in imprisoning the mysterious currents of electricity.

LITERARY NOTES.

Several new and important productions will shortly be issued by The Walter Scott Publishing Company. Among those books which are nearly ready will be found the "Reminiscences of Mr. Frederick Goodall, R.A."; 'Musicians' Wit, Humour, and Anecdote," by Mr. F. J. Crowest; "The Making of Citizens," by Mr. R. E. Hughes; "Sakuntala," by Kalidasa; "Select Essays of John Henry Newman"; and Renan's "Marcus Aurelius"; the last three being additions to the "Scott Library"; and "The Yeomanry in the South African War," by Mr. Karl B. Spurgin.

✧ ✧ ✧

Some appropriate mottoes for the birthday of Anatole France, which occurred recently, are:—

The hour of a complete maturity of a talent,
—Zola.

Monsieur, are you not lettered?—Shakespeare.

Je suis Academicien.—Alphonse Daudet.

Look on fertile France.—Shakespeare.

Benevolent Nature has placed him at the exquisite point where poetry ends and reality begins.—Zola.

He belongs to our modern class of trained men of letters. He is master of his art.
—Henry James.

An intellect to which one listens.—Meredith.

An eminent monsieur.—Shakespeare.

Write some letters literary.—W. S. Gilbert.

✧ ✧ ✧

We have all heard of the little girl who when she was good was very, very good, but when she was bad she was horrid. A correspondent of "Notes and Queries" asks for the authorship of an epigram on Women, which is built on the same plan, but is necessarily more solemnising. It runs:—

Oh the gladness of their gladness when they're glad,
And the sadness of their sadness when they're sad;
But the gladness of their gladness and the sadness of their sadness
Are as nothing to their badness when they're bad.

It seems that these useful lines have been attributed to Thomas Love Peacock, but the ascription is believed to be erroneous. And yet, one thinks, they might well have come from a writer who has been described as "a Rabelaisian pagan—egoistic, protean."

✧ ✧ ✧

In reference to the possible effect of the new tax upon the price of wheat, it is interesting to read the following entry in Pepys's diary for January 1, 1667:—"Dined with my Lord Crewe, with whom was Mr. Browne, Clerke of the House of Lords, and Mr. John Crewe. Here they did talk much of the present cheapness of corne, even to a miracle; so as their farmers can pay no rent, but do fling up their lands; and would pay in corne; but . . . our gentry are grown so ignorant in everything of good husbandry that they know not how to bestow this corne; which, did they understand but a little trade, they would be able to joyne together, and know what markets there are abroad, and send it thither, and thereby ease their tenants and be able to pay themselves." Coal, on the contrary, we are told by the same writer in the same year, was so scarce and dear as to be the cause of a mutiny in the Navy; while tea was as yet barely known. "I did send for a cup of tee (a China drink), of which I never had drunk before," he tells us.

✧ ✧ ✧

Until some "emancipated" Hindoo, with a genius approaching that of Dickens, or George Eliot, or Kipling, writes a novel of native life, the Western world will not know what that life really is. Native writers, among them a Christian pastor, have given us some glimpses of it, but glimpses only The newest author in this kind is an accomplished Bengalee, Mr. Romesh Dutt, C.I.E., known for his English versions from the old Indian Epics. Mr. Dutt has written, in English, a story of Indian domestic life, to which he has given the title of "The Lake of Palms," and which Mr. Unwin is about to publish. He describes the despotic rule of aged matrons over vast households, the quaint religious ceremonies which Hindoo wives and daughters observe at home, and the position of the Hindoo widow. To Western readers who interest themselves in India, the last is by far the most important matter. So would it be to the people of India themselves if tyrannical custom did not blind them to the evils of early marriage and compulsory widowhood. The despotically ruling Hindoo matron is one of the most curious characters in native Indian life. The Ranee, in Mr. R. Kipling's story, "Kim," is a type of this class—in the higher social sphere. Like Mr. Kipling, Mr. Romesh Dutt takes his personages through a pilgrimage to sacred places. Among Mr. Dutt's characters are some native youths as influenced by contact with the West—by the evil in it as well as by the good.

✧ ✧ ✧

The 10th April, 1710, is a noteworthy date in the history of literature. On that day came into operation an Act "for the Encouragement of Learning by vesting the Copies of Printed Books in the Authors or Purchasers of such Copies." This was the first measure passed for the protection of literary property: the word "copyright," according to Dr. Murray, was not used before 1767. In the preamble of the Bill, which is said to have been drafted by Dean Swift, the necessity of a measure "to enable learned men to write useful books" is dwelt upon. By its provisions two terms of copyright, each of 14 years, were created for all future publications, one term to follow immediately upon the other; if the author were still living, at the expiration of the first term. According to a subsidiary clause, if any publisher issued a book at a price judged too high by certain "discreet persons," he was liable to a penalty. The "discreet persons" included, among others, the Archbishop of Canterbury, the Lord Chancellor, and the Vice-Chancellors of Oxford and Cambridge; on them devolved the somewhat delicate task of fixing the book's value. This clause was repealed in 1739; but the term of copyright remained unaltered until 1842, when it was extended to the life of the author and seven years, or 42 years from the date of publication, whichever may prove longer. England was the first country thus to protect the right of authors. France followed suit in 1793; but in Germany no copyright law existed until 1870.

✧ ✧ ✧

Replying to a letter from Mr. Quiller Couch on the Shakespeare-Bacon controversy, Mr. George Stronach says that the former, in the endeavour to lower the esteem in which Bacon was held as a poet, gave inferior selections from some of the great man's verses. Mr. Stronach accordingly gives some selections of a different class:—

Thou carriest man away, as with a tide,
Then down swim all his thoughts that mounted high,
Much like a mocking dream that will not hide,
But flies before the sight of aching eyes;
Or as the grass that cannot term obtain,
To see the summer come about again.

Of this Spedding says: "I should myself infer that Bacon had all the natural faculties which a poet wants, a fine feeling for imaginative effect in words, and a vein of poetic passion: the thought could not well be fitted with imagery, words, and rhythm, more apt and imaginative; and there is a tenderness of expression which comes manifestly out of a heart in sensitive sympathy with nature. . . The heroic couplet could hardly do its work better in the hands of Dryden." "The lines I have quoted," says Mr. Stronach, "may not be 'poetry' acording to Mr. Quiller Couch, but they appear to me to be quite as good 'poetry' as Shakespeare's:—

Good friend, for Jesus' sake forbeare
To dig the dust encloased heare;
Bleste be the man that spares these stones,
And curs't be he that moves my bones.

These lines are supposed to be written by the author of 'The Sonnets.'"

✧ ✧ ✧

Colonel Harvey, president of the well-known publishing firm of Harper, has been giving his opinions to an interviewer on the condition and tendencies of the Anglo-American book world.

"What," he was asked, "is the most noteworthy tendency of American literature at the moment?"

"I think," he answered, "there can be little doubt that it is to be found in the rise and vogue of the purely American novel. I do not mean the proverbial American novel, for which the world has long been supposed to be waiting. It will never be written in one book, or by one man, because the subject of American life and character is far too big, far too complex, for that. What I mean is the American novel which deals with distinctive and characteristic parts of America—in a word, the local novel of American life and character."

"This style of fiction, as one gathers, is universally popular at present in America?"

"Yes, and I think it, and the ideas which it represents, will continue to dominate American literature for some years to come. Our people are anxious to read what they regard as pretty accurate and realistic accounts of life in those regions of the country which they do not personally know. Not more than four years ago the general historical novel—the novel of history here or there, it mattered little where—held the field. It has quite fallen away before the story with American colour; and the same change holds good in regard to short stories. Whereas before we gave prominence, in our monthly magazine, to what I may term short stories of action, we now select stories of character. It will be seen, altogether, that there has been a far-reaching development in American fiction. Incident you must always have, but that element is of less importance than character-study, and both are set in American local colour."

Asked as to whether the recent activity in American literature had been accompanied by a corresponding advance in reading on the part of the mass of the people, Colonel Harvey replied that "the two things have gone together, thanks to our system of education, which in the past ten years has enormously increased the percentage of book-readers. Every little place wants to have at its doors as good facilities for education as every big place has. We add about a million a year to the number of our population, but the increase in the number of readers is, in proportion, probably three times as great. After fiction I should think that history and biography—biography set out tersely, intimately, not in the old Blue-book style—will engage much of the energy of American writers in the future. Poetry? Well, I'm afraid poetry is not a very burning bush; there's no desperate demand for new poetry, always with certain exceptions." Speaking of the book trade in America, Colonel Harvey said it had been excellent for several years. He noted as a point of progress the attractively got-up books which most American houses now issue. "until not so long ago," he remarked, "we Americans were criticised, and rightly criticised, for the heavy paper on which we printed our books. Now we have changed all that." Colonel Harvey mentioned in particular that a new paper of good quality and singular lightness is coming into use in America. It is made from wood-pulp, by a special process, and he expressed the opinion that eventually it would everywhere become the popular paper for books.

SCIENTIFIC TOPICS.

Only the girls in a telegraph exchange in New York city and the officials of the telephone company know what a vast amount of business is transacted in the American metropolis by telephone. In New York and its suburbs about 120,000 telephones are in use, more than in all France. These 120,000 telephones are used in ringing up the central stations about 426,000 times a day.

✧ ✧ ✧

Aluminium saw handles are being introduced which are said to be both lighter and stronger than those of wood. There are several shapes, but they are all made of thin sheet metal worked into the desired form and supplied with perforations for the purpose of enabling workmen to get a secure hold of the tool. One of the designs offered is adjustable, so that the right hand side of the handle is flush with the saw, permitting the operator to work close to the floor or in other inconvenient places.

✧ ✧ ✧

Machinery suffers, perhaps, as much from overheating as it does from general wear. In order to indicate when the moving parts have become excessively heated, a German inventor has devised a paint composed of an amalgam of the iodides of mercury and copper—a composition which, he claims, will turn colour when heated bearings to which it is applied are red in colour under normal conditions. But when a temperature of 140 deg. Fahr. is reached the paint turns black.

✧ ✧ ✧

Marconi has finally decided on Table Head, 15 miles from Sydney, as the location for his Cape Breton Station. He told the officials of the town that flashes from the trolley wire would interfere with his system, and asked if the town could take some action on the matter. Forthwith a meeting of the Council was called. A resolution was passed that for a period of five years no trolley line was to be operated within a third of a mile of the station. Marconi says that the work of building the station will begin at once and will be completed within three months.

✧ ✧ ✧

The German War Office has offered three prizes of 10,000, 5,000, and 2,500 marks respectively for the best motor vehicles for military use. The machines must be ready for testing by February, 1903. Each automobile must be driven by alcohol; must be chiefly adapted for the transportation of military supplies and artillery; must not weigh less than 8 tons; and must have a tractive power of 16 tons on good roads. The vehicle must be able to travel on soft or rough ground and also through water 18 inches deep. A limit of 20 inches has been placed upon the width of the tyres. The competition is open only to German automobile makers.

✧ ✧ ✧

The recent violent earthquake at Shemakha, near Baku (Russia), afforded some very interesting and conclusive data regarding the rate of the earth's vibration. Shemakha is some 1,400 miles distant from Moscow as the bird flies, but the seismographic instruments in the University of the latter city duly recorded the disturbance. The earthquake occurred at 12.15 Shemakha local time, and it was recorded in Moscow at 12.13 local time. The difference in time between the two cities is 35 minutes, so the vibration of the earth's crust travelled over the 1,400 miles separating the two points at a velocity of 40 miles a minute.

✧ ✧ ✧

M. Edouard Branly, the well-known French electrician, who has long been interested in the problem of wireless telegraphy, has now perfected a device which it is stated will considerably develop communication by this means. It is called the improved Bramly radio-conductor. The Bramly coherer is already employed in wireless telegraphy, but the value of the new device is the important discovery that any two pieces of metal, provided one of them be polished or oxidized, will serve all purposes of the tube. Any metal will suffice for this object. The result has even been secured with a common needle. The new radio-conductor consists of a horizontal plaque of polished steel connected with one pole of the circuit, on which rests a small metallic tripod connected with the other pole, the three points of the tripod being oxidized.

✧ ✧ ✧

The currency of Abyssinia is somewhat varied, to judge by an account given of it by Count Gleichen in his story of the mission to Menelik. For standard money the people of Abyssinia use the Maria Theresa 1780 dollars, but for small change a very different coin is resorted to. This is no other than a bar of hard crystallised salt, about ten inches long and two and a half broad and thick, slightly tapering towards the end. Five of these bars go for a dollar at the capital. People are very particular about the standard of fineness of the currency. If it does not ring like metal when struck with the finger nail, or if it is cracked or chipped, they will not take it. It is a token of affection when friends meet to give each other a lick of their respective amolis, and in this way the value of the bar is decreased.

✧ ✧ ✧

According to the Centralblatt fur Accumulatorenund Elementenkunde, a German company is building electric tug boats with some success, these boats being employed for touring purposes regularly between Zehndenick and Berlin. The boats are 14 to 15 meters in length, 3.25 meters in width, and have a draught of 1.05 meters, and are able to tow barges of 150 tons at a higher rate than the steam tugs usually employed for this purpose. The chief advantages offered by these electrically propelled tugs is that their displacement is considerably less than that of steam tugs of equivalent drawing power, and they are, therefore, peculiarly suited for towing purposes in shallow and winding canals or rivers. The transport of goods by water is said to require only one-fifth of the drawing power required for transport by rail, so that this development of electrically-propelled tugboats is worthy of attention.

✧ ✧ ✧

An ingenious electric switch for crossovers of road surface railroads has been devised by Messrs. S. Dixon and Sons, electrical engineers of Leeds. The feature of the invention is the simultaneous automatic adjustment of crossovers on the rails and overhead wires of an electric system, the object being achieved by means of a small switch conveniently placed in front of the driver of the car. The switch is connected by ordinary electric wires with the trolley head, and is so arranged that when passing a convenient position in front of the crossovers to be moved, by merely turning the switch the points on both rails and the trolly wire overhead are opened, while a second contact, after passing the crossover, closes them. The necessary batteries for the circuit are inclosed in a box beside the track. The contrivance, which is extremely simple in mechanism, it also fitted with a hand lever, which in case of any breakdown in the electrical equipment can be used to set the crossovers and overhead switch by one movement.

✧ ✧ ✧

Some very cautious experiments have recently been carried out in the German Zoological Gardens in order to ascertain the actual influence of music upon animals. The instrument was the violin and Herr Baker was the performer. Of all the animals the puma was the most sensitive to the musical influence. His moods changed rapidly according to the nature of the melody, the animal frequently becoming very excited and nervous, "just like a Frenchman," as the report says. Leopards were entirely unconcerned, but the lions appeared to be afraid, although their cubs wanted to dance when the music became livelier. The hyenas were very much terrified, but the monkeys were merely curious and interested. Wolves, on the other hand, were highly appreciative, and seemed to beg for an encore. The experiments are to be continued and with a variety of instruments, in order to distinguish between the mental states which are actually produced by the music and those which are merely the result of an unusual experience.

✧ ✧ ✧

Two-thirds of all the letters which pass through the post offices of the world are written by and sent to people who speak English, says Bradstreet's. There are substantially 500,000,000 persons speaking colloquially one or other of the ten or twelve chief modern languages, and of these about 25 per cent., or 125,000,000 persons, speak English. About 90,000,000 speak Russian, 75,000,000 German, 55,000,000 French, 45,000,000 Spanish, 35,000,000 Italian, and 12,000,000 Portuguese, and the balance Hungarian, Dutch, Polish, Flemish, Bohemian, Gaelic, Roumanian, Swedish, Finnish, Danish, and Norwegian. Thus, while only one-quarter of those who employ the facilities of the postal departments of civilised Governments speak as their native tongue English, two-thirds of those who correspond do so in the English language. There are, for instance, more than 20,000 post offices in India, the business of which in letters and papers aggregate more than 300,000,000 a year, and the business of these offices is done chiefly in English, though of India's total population, which is nearly 300,000,000, fewer than 000,000 persons either speak or understand English.

✧ ✧ ✧

One of the recent balloon projects advanced in France is that of crossing the Sahara, and M. Les Deburaux, a prominent aeronaut, has been giving considerable study to the question, and thinks it quite practicable by his method of guide-rope, and that it would be possible to make the passage across the Sahara from Tunis to the Niger by utilising the north-easterly winds which prevail in the region. The Count Castillon de Saint-Victor, who was one of the party on the last Mediterranean trip, is convinced of the practicability of the scheme, and wishes to put it into execution. However, the expense of such an undertaking would be considerable, and a large balloon sufficient to carry four or five aeronauts would necessitate an outlay of £12,000. For this reason the promoters of the enterprise wish to make an experiment on a small scale and use a balloon which is not mounted by an aeronaut, but is arranged on an automatic system. This expirement could be made for the comparatively small sum of £800. According to the project of M. Deburaux the balloon is provided with an automatic apparatus for keeping it in equilibrium, and various registering instruments. It is estimated that under the most unfavourable conditions the balloon would remain in the air at least 12 days. There are ample data in regard to the prevailing winds in the region, and all the Sahara explorers are in accord that the north-north-east winds blow over the central Sahara in an almost constant manner from October to April, with invariable fine weather. These winds would propel the balloon provided with its guide-rope at a mean speed of 12 miles an hour, and thus it would cover 288 miles in 24 hours. If the balloon should become shipwrecked en route it would in any case have been seen by the nomads of the desert, and as its passage would be for them an extraordinary phenomenon, the news would be quickly spread abroad, and there would be no difficulty in forming an idea of the traject made by the balloon, and perhaps the wreck could be found, together with the registering instruments.

GLIMPSES OF THE PAST.

From the Dublin Newspapers of 1793.

October 24.—This day Mr Dunn stood in the pillory in Church street, agreeably to his sentence, for making use of certain seditious expressions at the house of Mr. Vousden in Church street.

An error, it seems, had happened as to the particular spot for erecting the pillory, it being placed opposite Mr. Vousden's house, instead of the church, as directed by the sentence. On the arrival of the Sheriffs and guards, the order of the court being read, the error was discovered, when one of the Sheriffs addressed the multitude, requesting their assistance in moving the pillory to its proper place, assuring them that they would be well paid for their trouble; but a sullen silence and inactivity prevailing among the crowd, he applied to a number of soldiers present as spectators, who instantly obeyed his directions.

When Mr. Dunn ascended the pillory, a gentleman from a window entered into some conversation with him; he was, however, severely reprimanded by one of the Sheriffs, who insisted no person should speak to the culprit.

Extract of a Letter from Roscommon.

"October 12, 1793.

"On Wednesday last arrived here the Right Hon. the Lord Chief Baron and the Right Hon. Prime Sergeant Fitzgerald, and they opened the new Commission to try those unfortunate persons whose trials were postponed from the last adjournment, on account of the return of an illegal grand jury.

"Early on Thursday morning, after the new grand jury panel had been called over, the counsel for the prisoners tendered a challenge to the array of the panel, to the following purport:—'That W. Crofton, Esq., who impannelled and returned the same was not qualified to act as Sheriff of this county, as he had not performed the requisites, as by the statute of the 2nd of Queen Anne, cap vi. is required by all officers on their several appointments and admissions into office: wherefore it is prayed that the array might be quashed.' The above statute enacts that all officers who do not qualify according to the modes specified therein, are incapable of acting in, or holding the same, and the office is thereby declared null and void.

"This challenge having been received, the Crown lawyers demurred thereto, ore tenus—whereby they admitted the want of qualification in the Sheriff; but after long arguments on both sides, the Court disallowed the challenge. Negative certificates of the non-qualification of the Sheriff were ready to be proved, but the prisoners' counsel, relying on the point of the demurrer, admitting every fact in the plea or challenge, declined producing them.

"The prisoners not agreeing to join in their challenges to the petty jury, the principal of them, Mr. J. M'Dermott, was then arraigned singly on an indictment containing nine several counts; the principal of which was—'For having, on the 21st of May last, feloniously, with several unknown, broke open the house of Thomas Tennison, Esq., and thereout stole several articles of plate, wine, etc., etc.' To this he pleaded Not Guilty. A panel of near three hundred names being returned, after three hours taken up in trying several challenges for cause in favour of the prisoners, and also of the Crown, about twelve o'clock a jury was sworn.

"The indictment was opened by the junior counsel for the prosecution, and then the Solicitor-General stated the case with great ability and vast ingenuity. Several witnesses were produced and examined to support the indictment; three were produced by the prisoners; and after a very able and discriminating charge from the Chief Baron, the jury retired about ten o'clock; but not being likely to agree, the court was adjourned until this morning at twelve o'clock, and a difference of opinion still continuing, their Lordships determined to bring the jury to the bounds of the county, and directed the Sheriff to prepare forthwith.

"The Solicitor-General, with that humanity for which he is so particularly distinguished, interceded in the name of Mr. Tennison, to have the several unfortunate wretches that remained on the calendar bailed, which the Chief Baron readily assented to; and, having discharged the goal, the commission, with the prisoner, the Sheriff, and the jury, escorted by a troop of the 14th Regiment of Light Dragoons, proceeded to the bounds of the county.

As the jury were leaving the town, those who had been for acquitting the prisoner consented to find him guilty to the value of 4s. 9d., to which the others assented; but, to the surprise of every one, on coming to the bounds of the county, about four miles, they changed their minds again, and refused to give any verdict, on which the prisoner was remanded."

Counsel for the Crown—Right Hon. Solicitor-General, Hon. Ed. Stanley, John Blossett, Esq.; James Whitestone, Esq. Agent—Mr. Kemmis.

Counsel for the Prisoner—John Geoghegan, Esq.; Charles M'Carthy, Esq.; William Boyd, Esq.; Owen M'Dermott, Esq.

November 1.—On Friday night last, at the hour of nine o'clock, a number of armed men surrounded the house of Mrs. Moore, of Ballintree, in the county of Meath, and parish of Kilbride; first they fired several shots into the house, then proceeded to the haggard and took out some straw to set fire to the place if not admitted, which the people of the place were obliged to do, then proceeded to plunder the house, and took cash, plate, and several other articles of value. And on the same night they proceeded to the house of Mr. Tyrrell, of Strokestown, in the parish of Dunboyne, in said county, and robbed him of cash and sundry articles.

It gives us great pleasure to record the gallant behaviour of two companies of Irish Artillery, when the army retreated on the 8th of September. Their orders were to march from Ostend, and proceed with all possible expedition to Furnes. In their route they met the baggage of the army retreating, and every person they addressed giving them a worse account than they had heard before. Many dissuaded them from pursuing their march, and concluded they would never return. They were young men, yet their spirit and good fortune disappointed these conjectures; not an individual shrunk or showed any symptoms of fear. They arrived time enough to save a valuable depot of ammunition, which, but for their seasonable exertions, would have fallen into the enemy's hands. They received thanks in the handsomest manner from Colonel Congreve, of the Artillery, who afterwards reported their conduct to the British Commander-in-Chief.

Committed to the gaol of Maryborough, on the 24th inst., by Sir Robert Staples, Bart., James Edw. Hamilton, late of Clookskerry, gent.; Richard Moore, jun., of Rathdowney, attorney; William Kealey, of Coolkerry, labourer; Patrick Lawler, of the same, labourer; and William Stapleton, of the same, labourer; all in the Queen's County; who stand charged, upon oath, with forcibly, feloniously, and without due process of law, taking and holding possession of the said lands of Coolkerry.

November 2.—Yesterday a cause of some novelty was tried in the city Court-house, Limerick, before the Mayor, Recorder, and Sheriffs, wherein Edwd. Parker, Esq., was plaintiff, and Capt. David Forbes, of the 34th Regiment, lately commanding officer of this garrison, was defendant. The action was brought for the value of a horse, killed by the firing of soldiers at a target, under the command of the captain. The gentlemen of the bench, the counsel on both sides, and every auditor, appeared most anxious in expressing their most cordial approbation of the meritorious conduct of this brave officer, well recollecting the very signal services he rendered to this city and county while commanding officer and magistrate at large of the county; to which he was most honourably appointed by the express favour of our upright Chancellor. The jury, composed of the first characters in the city, held themselves bound, not only by law, but in conscience, to find a verdict for the plaintiff; yet no doubt can remain that the Government of this country will reimburse the worthy captain in every expense he may be put to in the business. Counsel for the plaintiff—Geo. Pitt, Esq. For the defendant—Thomas Casey, Esq.

Sunday last a melancholy accident happened in the harbour of Cork:—Lieutenant Forde, with Ensigns C. Upton, F. Tidy, and the surgeon's mate of the 43rd Regiment, having dined with some of the officers of their regiment who were in a different ship, were returning in the evening to the transport in which they were appointed to sail, when unfortunately the boat overset, by which Messrs. Forde, Upton, the surgeon's mate, one soldier (who was servant to Mr. Upton), and five sailors were drowned; two sailors and Ensign Tidy saved themselves by swimming till boats came to their assistance.

THE MEETING HOUSE, DUNGANNON.

WHERE THE VOLUNTEERS ASSEMBLED IN 1782.

(FROM A CONTEMPORARY PICTURE.)

The paper which Mr. C. Litton Falkiner has contributed to our pages, on "The Parish Church of the Old Irish Parliament," has suggested the reproduction of the picture of the Meeting House in Dungannon, wherein the Volunteers of '82 assembled and adopted those resolutions the carrying into effect of which contributed so many striking pages to the Parliamentary history of our country. The picture of which above is a copy appeared in the "Anthologia Hibernica" in 1793, with the subjoined description:—

Dungannon is an ancient borough in the county of Tyrone, and gives name to a barony, and title to the noble family of Trevor. It was the ancient patrimony of the O'Neils, the great chiefs of Ulster. In 1498 it was the principal seat of Neil Mac Art O'Neil, who had a strong castle here, which the same year was taken by Gerald, the eighth earl of Kildare. The castle was soon recovered by its former possessor, but in 1517 was again surrendered to Gerald, the ninth earl of Kildare, who burnt it. Con O'Neil, in the reign of Henry VII., built a small monastery on the south side of the town, for Franciscan Friars of the third Order; which, on the suppression of religious houses, was granted to Richard, earl of Westmeath, who assigned it to Sir Arthur Chichester, ancestor of the present Marquis of Donegal.

The castle experienced the vicissitudes of turbulent ages, being alternately in the hands of contending parties, sometimes dismantled, and sometimes repaired. In the troubles of 1641 it was one of the first seized by the northern insurgents, but it shared the fate of the other fortresses, being demolished by the parliamentary forces.

Dungannon continued in obscurity until the 15th February, 1782, when the Ulster volunteer delegates assembled there in the dissenting Meeting-house, there being no church. After choosing Col. Wm. Irvine their chairman, they entered into spiritual resolutions, which in the event secured the independence of our parliament, our national judicature, our commerce, and a happy toleration. On the 8th September, 1783, there was another assembly at Dungannon, when 500 delegates from 270 volunteer corps appeared. Col. James Stewart was called to the chair, and twenty-two resolutions were unanimously agreed to. The 13th was, "Resolved unanimously, that a committee of five persons from each county be now chosen by ballot to represent this province in a 'Grand National Convention,' to be held at noon in the Royal Exchange of Dublin, on the 10th

November next; to which, we trust, each of the other provinces will send delegates, to digest and publish a plan of a parliamentary reform; to pursue such measures as may appear to them most likely to render it effectual, to adjourn from time to time, and convene provincial meetings, if found necessary." This resolution was suggested by the Rev. Mr. Wyville, of Yorkshire, who, at the same time, was zealously urging the plan of a reform in England. The Convention met on the day appointed, and broke up the 2nd December in the same year.

On the 15th February, 1793, delegates from Ulster again met at Dungannon, William Sharman, Esq., in the chair, when fifteen resolutions were agreed to: they were strongly expressive of the emancipation of the Roman Catholics, of a parliamentary reform, and the rejection of a national militia.

THREE COUNTY HISTORIES OF CLARE.

A REMARKABLE COINCIDENCE.

Mr. James Frost, M.R.I.A., etc., etc., than whom there has been no more painstaking Irish historian, commenced to write "The History and Topography of Clare" (his native county) in the seventies or early eighties, and it was published in 1893. He consulted with extreme care all the authorities, many libraries, and MSS. of the Three Kingdoms and the Continent, and visited, in order to verify facts, every parish in Clare. As a grand juror for many years of Co. Clare, he was very conversant with his native county; but lest any inaccuracy in any form might creep into his book, he again visited every parish, ruin, etc., and compared the traditions with his authorities, the result being the extremely correct book under notice. He is now completing a County History of "Irish Names," whose interest to Claremen at home and abroad it is difficult to overestimate. This beautiful book of 660 pp., and illustrated, is now reduced from 7s. 6d. to 5s., per post, 5s. 6d., and American post, 6s. Mr. J. Hayes, Bookseller, Ennis, has the exclusive sale of the remainder of this book.

Very Rev. J. Fahy's (P.P., V.G., M.R.S.A.I., etc., etc., St. Colman's, Gort) "History of the Diocese of Kilmacduah (part in Clare and part in Galway), is practically a history of Clare. It is the result of very many years of careful study of Irish archæology and Irish Church history. This kind-hearted and widely-known Sagart a rúin (Sagart Aroon), will live long in the love of the people of his diocese, and, indeed, in the memory of every one who has had the pleasure of once meeting him—for to meet is to love him. It is now also reduced from 8s. to 4s., per post, 4s. 6d., American post, 5s. The exclusive sale of this book is also in the hands of Mr. Hayes.

Dean White's "History of Clare and Dalcassian Chiefs" is very suitable for the general reader, being written in a very clear and flowing style. It is reduced from 10s. 6d. to 3s. 6d., per post, 4s., American post, 4s. 6d., and may also be had from Mr. Hayes.

The three authors published their books in 1893—all three, we believe, being quite unconscious of the others' work. No other county in Ireland can boast of such industry and success in county histories, and all of such high standing.

THE HISTORY AND ANTIQUITIES OF THE CITY OF DUBLIN.

FROM THE EARLIEST ACCOUNTS:

Compiled from Authentick Memoirs, Offices of Record, Manufcript Collections, and other Unexceptionable Vouchers,

By THE LATE WALTER HARRIS, ESQ. WITH AN APPENDIX.

Chap. VIII.

Of the forces, musters, and military discipline of the city of Dublin, according to the ancient constitutions, customs, and usages.

The signal actions done from time to time by the citizens of Dublin, in aid of the state, will be seen hereafter; in the meantime, it may be thought necessary to say a few words of their "military discipline" in ancient times, which produced those services for which they have been justly remarkable: For it is habit and discipline that create the chief distinctions between man and man in point of valour, notwithstanding what has been alleged on the score of inward worth.

The military forces of the city were anciently composed of twenty corporations, commanded in chief by the principal magistrate, and every company under the guidance of their respective masters, as captains, subordinate to whom were appointed lieutenants, and other inferior officers. The foot, consisting of twenty companies, were mustered and exercised four times a year: 1st. On Easter Monday, commonly called "black Monday," from a disastrous accident which happened to the citizens of Dublin on that day; 2ndly, on May-day; 3rdly, on Midsummer-eve; and 4thly, on St. Peter's-eve. On "black Monday" and "midsummer-eve" the mayor and sheriffs mustered and commanded the forces in person; but on the other two days, the mayor and sheriffs of the "bull-ring" had the chief command of the "bachelors," who were then mustered before them. The horse were mustered on Shrove Tuesday, and then commanded in chief by the sheriffs of the city. The charges of these musters were defrayed by fines levied on such freemen as had been married the foregoing year. The mayor and principal citizens sat at these musters under a pavilion or tent erected on the top of a butt; and every person so married, being below the estate of paying a fine in money, presented the mayor with an orange, as an acknowledgement for the fine, which by the constitution and custom of the city he was liable to.

The mayor of the "bull-ring" was an officer eligible by the citizens yearly, to be captain or guardian of the bachelors of the city; and during the year of his office had authority to punish such as frequented brothel-houses, and the like infamous places. He took his name from an iron ring in Corn-market, to which the butchers fastened their bulls for baiting; and when any bachelor citizen happened to marry, the custom was for the mayor of the bull-ring and his attendants to conduct the bridegroom, upon his return from church, to the ring, and there with a solemn kiss receive his homage and last farewell: From whence the new-married man took the mayor and sheriffs of the bull-ring home to dinner with him, unless he were poor; in which case, the mayor and his bachelors made a collection for him, which they gave to him at the ring, upon receiving his homage. But this office seems to have been ludicrous, and established merely by custom, without any foundation of authority.

The muster on "black Monday," beforementioned, and the name of the day, had their rise upon this occasion. The Bristolines of Dublin, to whom king Henry II. granted the city, by custom had introduced a sport among them called "hurling of balls," which they practised on all festival days. One party of the citizens challenged another party to exercise this recreation on Easter Monday near Cullen's-wood, two miles from Dublin. Having, as they thought, at that time fully subdued the Irish enemy, they feared no attempt from them, and therefore went out unarmed. But a false brother gave notice of the citizens' intentions to the enemy, then lurking in the neighbouring mountains, who marching down privately, laid an ambush in Cullen's-wood, who fell on the citizens, unprepared and fatigued with the laborious diversion, and slew upwards of five hundred of them. This disaster happened in the year 1209, and ever since hath been called "black Monday." The city was soon after replenished by a new colony of Bristolines, who for ages after kept up the memorial of this misfortune, by marching out to the place well armed every Easter Monday, and bidding defiance to their enemies.

The citizens heretofore in general hostings marched out with a black standard carried before them; which proved a great terror to the Irish enemy, as knowing by dear-bought experience that it was attended by valiant, well-disciplined, and soldierly citizens.

Chapter IX.

Brief annals of the city of Dublin from the year 448 to the year 1169, when it was first invaded by the English, during which period the Ostmen or Danes became masters of it.

We have seen before (Chap. I.) that Dublin was either built or fortified by the Ostmen

or Danes, who settled here early on the score of traffic; but, as these mercantile people had for a long time no concern in government, it cannot be expected that their actions could afford any matter for history, till their countrymen came hither for the purposes of conquest in the 9th century, and, like a deluge, spread the terror of their arms through the whole kingdom.

That Dublin, and the adjacent territories, were early governed by Roitelets, or petty kings, is manifest from the tenor of the Irish history, though the names of such petty kings have not been handed down to us, except in one instance only. For the kingdom being cantomed into several parts, the supreme monarch had his share of territory, as well as the dominion of the whole. The four provincial kings were governors of the four provinces, yet in subordination to the supreme monarch, to whom they were feudatory, and collected and paid the allotted tributes and taxes for the support of the government to him; so that, properly speaking, they were "substitutes" or "viceroys" only to the monarchs of Ireland, though they often undertook to mete his power. If the provincial kings were to be considered in any other light, it would be repugnant to the nature of monarchy, which was always the prevailing form of government in this island; and the title of king of Ireland would be only an empty shadow if those provincial kings should be allowed singly to enjoy a supreme right of magistracy in their respective shares. For then nothing would be left to the supreme monarch but the little territory of Meath, which was reckoned his private estate, and was allotted to him for the maintenance of his table.

As the provincial kings were substitutes to the supreme monarch, so they had under them other "inferior kings" of smaller territories. For the possessors of considerable domains in Ireland were in common acceptation dignified with the titles of kings, though in reality they were only subjects; so that to this passage of Martial, "Qui rex est, regem, Maxime, non habeat," may be opposed another (Flah. Ogyg. p. 31), "Degener in tuguri rex lare quisque fui." Thus we read frequently of the king of Brefinny, the king of Kinsellagh, the king of Ossory, the king of Cashell, and the like, who were all subjects only to the several provincial kings, as these latter were to the monarch. The Irish in this instance of petty kings, followed the examples of other nations, who often gave the title of kings to the governors of small territories, and sometimes to those of single towns. Thus Ulysses was called king of Ithaca, though his dominions were only a craggy island of about 25 miles in compass; insomuch that Cicero compares them to "a nest built upon a rock." Nestor had the title of king of Pylos, though his power extended no further than a single town of that name in Peloponnesus. Joshua slew thirty-one kings in the small compass of Palestine alone; and Strabo affirms that every city of the Phœnicians was governed by a peculiar king. Nor is there occasion to travel so far for instances of this kind, Kent alone being subject to four kings, when Julius Cæsar invaded it.

The Irish language distinguisheth the office of king by two words (Ogyg. p. 28), namely, "airdrigh," or the high king; i.e., the supreme monarch; and "righ-beag," i.e., the little or "petty king"; in latin "regulus," who was a provincial or inferior king, and owed obedience and subjection to the "airdrigh," though at the same time he exercised an absolute authority over his own subjects, who nevertheless had a right of appeal to the supreme monarch. There were also other petty kings of smaller districts in Ireland, some subject to the "airdrigh," and some to the provincial kings. From hence it seems to be fairly collected that the provincial kings were the great officers of the supreme monarch's court, and of his council; and that the other petty kings, or chieftains of smaller districts, were in the nature of counts, barons, or lords of manors in other countries, and were probably the great officers of the several provincial kings, and of their council. Some ancient writers, taking example from the customs of other countries, have not unfrequently called these last mentioned petty kings by the titles of "dukes" (duces) or chieftains, and counts. Thus the author of the life of St. Declan (MS.), not yet published, calls the father of Declan, "Ercus, dux Desiorum," i.e., Ercus, duke or chieftain of Desies, then a territory, now a barony in the county of Waterford, of which the descendants of that Ercus continued petty kings until the arrival of the English. So in the life of St. Carthag (cited by Flah. Ogyg, p. 29), Melocride is called dux Nan-Desi, duke or chieftain of Decies. Bede (Eccl. Hist. lib. 4 cap. 4), in his account of St. Colman, says, "That he bought Mayo a comite ad cujus possessionem pertinebat—from a count whose estate it was." The author of the life of Laurence O'Toole (Jnt. Surii Collect.), archbishop of Dublin, who died in the year 1180, mentions a count of Kildare, who undoubtedly was then petty king of that district; for Kildare was not erected into an earldom till 1316.

The Danes, having settled themselves in the government of Dublin, followed the example of the Irish in this particular, and were sometimes called kings, and sometimes counts; of which an instance may be seen in the black-book of Christchurch, Dublin, where Sitric Mac-Aulaff, king of the Ostmen of Dublin, is called Sitricus, rex Dublin, filius Ableb, comitis Dublin, which Ableb, otherwise called Aulaff, was immediate predecessor to Sitric.

Many instances of this sort of petty kings might be cited from the histories of Ireland, which, to avoid prolixity, are omitted; and thus much is advanced only to give the reader some idea of the nature of the kings, or chief governors of Dublin in the Danish times, who undoubtedly owed subjection to the provincial kings of Leinster; though in the 9th and 10th centuries, when they had strengthened themselves in Dublin, Fingal, and other adjacent territories, they shook off their allegiance, and often made war on these princes.

One instance only occurs of a king of Dublin (and that in the 5th century) before the invasions of the Danes in the beginning of the 9th, and he is mentioned (it must be confessed) by no very reputable writer (Jocelin. vit. Patricii, cap 71), as follows:

A.D. 448. Alphin Mc. Eochaid, king of Dublin, and his subjects, were converted to the Christian faith by the preaching of St. Patrick, and baptised in a fountain called after that missionary's name, St. Patrick's Well, on the south side of the city, near the place where the steeple of the church dedicated to him now stands, which well (we are told by archbishop Ussher) (Primord. p. 863) was a little before the year 1639, shut up and enclosed within a private house. In the black-book of Christ-church the following passage may be seen. "Fornices, &c. The arches or vaults were built by the Danes before the arrival of St. Patrick in Ireland; and at that time Christ-church was not built in the manner it is now; and therefore St. Patrick celebrated Mass in one of the arches or vaults, which to this day is called the arch or vault of St. Patrick: and St. Patrick prophesied concerning the building of Christ-church there in future ages." It must follow from hence that these vaults were erected by the Ostmen merchants, as a depository for their wares, many ages before that people came to make settlements here on the score of conquest, which happened in the following time and manner

A.D. 838. The Ostmen entered the river Liffey (Annals of the Four Masters), with a fleet of sixty sail, in aid of their countrymen, who had ravaged the land, and made several settlements in it during the space of 43 years before. Dublin now submitted to them for the first time, in which they raised a strong rath (Waræi Antiq. cap. 24), and thereby curbed not only the city, but in a little time extended their conquests through Fingal to the north, and as far as Bray, and the mountains of Wicklow to the south. These parts seem to have been soon after made the head of the Danish settlements in Leinster, and from them Fingal took its name, as much as to say, "the territory of the white foreigners or Norwegians," as the country to the south of Dublin was called "Dubh-Gall," or "the territory of the black foreigners," from the Danes. This last denomination is not preserved in history, that we know of; but it remains by tradition among the native Irish of these parts to this day. The Danes, however, were soon after driven out of Dublin. Turgesius, their principal commander, was slain in 845, and the greatest part of the Danes driven back to Norway, and the islands from whence they came.

(To be Continued.)

MAY-DAY and MIDSUMMER
IN
IRISH FOLK-LORE.

By N. O'KEARNEY.

La Bealtine, the day of Baal's fire, as the first day of the month of May is called in Irish, was unquestionably a day on which a solemn festival was held by the Druids; possibly the most solemn festival in the Pagan calendar—the festival of La Samna the first day of November, excepted. It has been frequently alleged that little or no trace of Druidical religion can now be discovered, because the reminiscences relative to it found in authentic Irish manuscripts are too meagre and insufficient to found anything like a rational theory upon their authority. There is, it must be confessed, strong ground for this argument, especially in case there were no other aids to fall back on; but if we look carefully around us, examine Ireland as we find her, attend to the traditions that yet remain among us, and compare them with the strange customs still prevalent in many places, and with such extraneous rites as we find analogous with them, a theory may yet be formed which will throw much light upon many mystic passages found in Irish manuscripts, as well as on Irish history itself, though it may not be found sufficient for the full development of the ancient Druidic religion. In elucidation, it is necessary to give a few of the strange customs that were practised, and many of which are still practised, at the periodical return of May-day and midsummer.

On the morning of Bealtine, it was customary with such as possessed cattle, especially herdsmen, who were skilled in the old practices, to omit lighting their fires until midday at least, when the sun was at his meridian altitude, or until they found that their less cunning neighbours had lighted theirs; for then no danger, as they supposed, was to be apprehended. The reason they assigned for this custom was, that witches and other malicious creatures, invisible as well as visible, possessed power to rob them of the produce of their dairies, and to do great injury to their cattle and other substance. Those who were addicted to these customs would on no account permit any person, even their most intimate friend or dearest relation, to take away any portion of their fires, when lighted, outside of their houses on that day, because they imagined that it would be unlucky and would militate against their prosperity; and to such a degree of exactness was the prohibition carried out that a mother was known to have refused her daughter, who lived in the neighbourhood, and whose "fire went out," as the phrase goes, an ember to kindle her fire to dress food for her children and husband. This absurd practice, it is clear, did not emanate from any principle of Christianity, but was a relic of the Druidic prohibition, which forbade any person to light a fire on that day, or derive an ember to kindle a fire from any other source, except from their own sacred fires, for which each family paid a certain tax. An extract from the Leabar Breac, given in the "Book of Rights," published by the Celtic Society, (1) will throw some light on the nature of the prohibition respecting the Druids' fire "Patrick goes afterwards to Fearta Fear Fiecc. A fire is kindled by him at that place on Easter eve. Laegaire is enraged as he sees the fire, for that was the geis (prohibition) of Teamhair among the Gaedhhil; and no one dared to kindle a fire in Ireland on that day until it should be first kindled at Teamhair at the solemnity," by the Druids, it may, perhaps, be added. It little matters whether the fire described above was the Baal fire, or any other Druidical fire, since the sacred fire was lighted more than once in the year, under equally stringent prohibitions, as appears by an extract from St. Patrick's Life by St. Mochta (2):—"Erat quoque quidam mos apud illos per edictum omnibus intimatus ut quicumque in cunctis regionibus sive procul, sive juxta, in illa nocte incendissent ignem, antequam in domu regia, id est, in palatio Temoriæ, succenderetur, periret anima ejus de popula suo." It was in consequence of the fear inculcated by the threat of this very severe penalty, and the dread of supernatural evils, with which the Druids threatened the people as a judgment for the clandestine violation of their ordinances, that the superstitious practices of neglecting to kindle fires, or give any portion of fire to light that of their neighbours, prevailed

It seems probable that the Druids consecrated water, as well as fire, on the eve of Baal, and possibly prohibited its use, except what was drawn from their sacred fountains; and that it was a source of revenue to them, as well as fire. No authority, however, has yet been found for this assumption, except it can be inferred from a practice very prevalent, of drawing the first water after midnight, from wells and fountains; this was called ꝼɀaiṫ an ṫobaiꝛ (the purity of the well)—positively a Pagan superstition. The people of each village, or townland, usually sat up on the eve of Bealtine, that they might overreach one another in drawing the first draught or pitcher of water from their wells and fountains. As the water should be drawn furtively, many an ingenious plan and cunning stratagem would be devised and used to outwit the rest of the neighbours in procuring the ꝼɀaiṫ. Whoever succeeded usually cast a tuft of grass into the well, which warned all others that that well had been robbed of its ꝼɀaiṫ. This first water was carefully preserved during the year, and was looked upon as a powerful charm or antidote against witchcraft and other imaginady evils which impeded; it was also considered very lucky to keep it in the house.

Another custom was scrupulously observed after sunset on the eve of Bealtine. Farmers, accompanied by their servants and domestics, were accustomed to walk around the boundaries of their farms in a sort of procession, carrying implements of husbandry, seeds of corn, ꝼɀaiṫ an ṫobaiꝛ, and other requisites, especially the sacred herb, bean fin (vervain), if any person were fortunate enough to possess a sprig of it. The procession always halted at the most convenient stations facing the four cardinal points, beginning at the east, and went through several ceremonies, particularly that of digging a sod, breaking it fine, and then sowing seed, after which they sprinkled the glebb with ꝼɀaiṫ an ṫobaiꝛ. They then drove all their cows into one place, and examined their tails, lest a witch or evil-disposed person might there conceal a sprig of the rowan tree, or some other bewitched token. If any suspicious bramble were found attached to a cow's tail, it was immediately taken and burned, and a sprig of vervain, if convenient, or a branch of the rowan substituted instead; for the rowan was potent for good as well as evil, if it were cut before sunrise on Bealtine morning. The cows were afterwards sprinkled with ꝼɀaiṫ an ṫobaiꝛ, preserved since last May-Day, which ended the ceremony.

It cannot be conveniently denied that these customs, too, were remnants of the superstitions practised in the olden time. The Hindus of the present day look upon the Cusha grass as sacred, and use it in almost all their lustrations. Our species of grass, called ouisheag, was once used for similar purposes, if we may credit herb-doctors and charm-mongers; and the casting of a tuft of it into the wells, on the night of Bealtine, was, possibly, once a sacred rite. The Hindus, too, have their cow-festival, called Gosht'hashtami, which is held on the 8th of Cartica; on this festival cows are attended to the pasture, hand-fed, and caressed; and the Hindus walk round them with ceremony, keeping them always to the right (3). These customs in Ireland, and similar ceremonies in Hindustan, were performed with the view of conciliating the moon, which was represented by the cow, in order that the deity represented by that animal, which was also a type of the earth, like the Rhea of the Latins, and Rae of the Irish, would deign to insure them a prosperous harvest. This is clearly shown by the following: Prithu having been churned from an apereure made in the right arm of his father Vena, was, unlike his wicked brother who had been churned from the left arm, a beautiful boy, and proved to be the form of Vishnu. "Gods and men came to make obeisance to him, and celebrate his appearance on earth. He married a form of the goddess Lacshmi. In his time, the earth having refused to give her wonted supplies to mankind, Prithu began to beat and wound her. The earth, assuming the shape of a cow, went to the high grounds of Meru, and there laid her complaint before the supreme court, who rejected it; as she acknowledged, that she had refused the common necessaries of life, not only to mankind in general, but to Prithu himself, whose wife she was in human shape. Prithu and his descendants were allowed to beat and wound her in case of non-compliance with the decree of the supreme court. The earth submitted reluctantly, and since that time mankind are continually wounding and beating her, with ploughs, harrows, hoes, and other instruments of husbandry (4)." Though this is an allegorical legend, it is singular that this Prithu was the sun, since he is said to have been a form of Vishnu; for Vishnu was the name of the sun at night, or when in the west. The sun is Brahma in the east, while it is morning; and from noon to evening he is Siva, a circumstance which throws some light on the Irish custom of breaking up a sod of turf at the four cardinal points, on the eve of Baal, or the sun's festival, a ceremony which originated, no doubt, from a more rational cause than can be, at present, discerned. It, too, is worthy of remark, that the Hindu triad, Brahma, Vishnu, and Siva, like Baal, Budh, and Grian of the Irish Druids, is nothing more, despite the compound mystification of their mythology, but the one and same object, namely the sun, the great deity of the Pagan world, whose festival was wont to be held on La Bealtine by the Irish Druids.

It may also be remarked that the same Lacshmi, the earth, moon, or goddess of prosperity, is frequently invoked as a cow. A cow is held by the tail, an approximation to the Irish custom, and the following prayer repeated, according to Hindu ritual:—"1. May the goddess, who is the Lachsmi of all beings, and resides among the gods, assume the shape of a milch cow, and procure me comfort. 2. May the goddess, who is Rudrani in a corporal form, and who is the beloved of Siva, assume the shape of a milch cow, and procure me comfort. 3. May she, who is Lachsmi reposing on the bosom of Vishnu; she, who is the Lachsmi of the regent riches; she, who is the Lachsmi of kings, be a boon-granting cow to me. 4. May she, who is the Lachsmi of Brahma; she, who is Swaha, the wife of fire; she, who is the exerted power of the sun, moon, and stars, assume the shape of a milch cow for (my) prosperity (5)." Hence, it is clear that this goddess of prosperity, who was invoked to assume the shape of a cow, was considered to have been the wife of fire or the sun and moon; and, the cow, on account of

her productiveness, was made the emblem of both in compound sense, since the moon was always considered to have great influence over the earth, its fruits, and the seeds committed to the earth, and, therefore, the cow was the most fit and tangible object of ceremony.

That the Druids looked upon the bovine species as sacred animals, some may doubt, nay deny; but if we attend to tradition, we can easily learn that they held the species in veneration, if they did not actually pay divine honours to the animal, like the old Egyptians. It would, indeed, be tedious to mention even the titles of the legends relative to mythic bulls and cows still extant: suffice it to say, that such animals as the Fionn Beamnach, the celebrated bull of Connaught, and the more mythic Donn Cuailgne of Ulster, whose extraordinary powers are set forth in the "Tain Bo Cuailgne," were certainly not ordinary animals; for had the Donn Cuailgne, as an animal, taken the gold medal at all the cattle-shows in the island, since the very day he had been calved, were he nothing more than a bull, it is absurd to suppose for a moment that the Connacians were so foolish as to wage bloody war for seven years with the Ultonians to obtain possession of the animal. (6). Such an inference may be drawn from the traditions of the people—who believe in the existence of an aerial bull, called by some Tarbh Conaire, and imagine that a certain disease incident to horned cattle, called geimneach, and urgartha, is caused by hearing his lowing in the air—from topographical terms, with which numerous legends of mythic bulls and cows are associated, and, lastly, from the practices of the people with respect to their cows. It is possible to presume that the Druids were the originators of those customs, since we find that they used to drive cattle between their sacred fires:—"Beltine, i.e., Biltine, i.e., lucky fire, i.e., two fires which used to be made by the lawgivers or Druids, with great incantations, and they used to drive the cattle between them (to guard) against the diseases of each year. Or, Beldine; Bel was the name of an idol god. It was on it (i.e., on that day) that the firstlings of every kind of cattle used to be exhibited as in the possession of Bel" (7). Hence it appears that the Druids made use of cattle at their sacred fire, and exacted an offering of their firstlings to their deity. It is, perhaps, in commemoration of this offering, that some old folks, for no reason that could be assigned, except that some invisible being of the spiritual world required some nourishment which through their tenderheartedness they could not refuse, used to pour the first milk drawn from a newly-calved cow at the foot of a solitary or sacred white thorn. Analogous with this is the Hindu custom of offering milk, curds, etc, to the manes of their ancestors. The hawthorn is still considered to be under the tutelage of the "good people," or fairies; and it is a branch of it that is used as a May-bush, circumstances almost sufficient to warrant the inference that the hawthorn had been sacred to Bel, or the sun.

The Baal-fire was lighted by the Druids at Tlachta, on the first day of the month of May: it is still lighted in Dublin and its vicinity on that day; but in all other parts of Ireland on the eve of the festival of St. John the Baptist. A few say that the change was caused by St. Patrick with the view of doing honour to the precursor of the Redeemer; the most prevalent account, however, is that fires had been lighted on that eve as a preconcerted signal for the Irish to make a general onslaught upon the Danes, who grievously oppressed them at that time. This has some show of probability, and may account for the Baal-fire being continued in Dublin on the eve of Bealtine. If the fires had really been lighted on midsummer-eve, as a signal for a general massacre of the Danes throughout Ireland, it is possible that, since Dublin was the principal stronghold of the foreigners in Ireland, fires were not lighted there on that occasion, or, if the Danes were massacred, it is reasonable to suppose that those of Dublin would prohibit fires being lighted to commemorate the anniversary of the slaughter of their countrymen—reasons strong enough to warrant the prevalence of the practice of lighting the Baal-fire on the day of Baal in Dublin only. But there are reasons to suspect that the midsummer fires were originally lighted by the Druids on that night as well as on the eve of Baal. It is, indeed, possible, may probable, that on that day, when the sun reached the zenith of his annual glory, a festival was held in his honour. On that eve many strange practices are still prevalent, such as gathering the seed of the common fern or filix major vulgaris, performing certain kinds of divinations, competent, as they are supposed, to reveal the names, and manifest the personal appearances of the destined helpmates of the performers, and other absurd mummeries, which are never known to be practised, except on days dedicated to Pagan rites.

It was a general practice, about eighty years ago, in most villages, to erect long poles called May-poles; but these, too, fell into desuetude, except in a few places, especially in the village of Finglas, near Dublin, where the pole stood, until the clergy of the parish caused it to be destroyed and the "fun" dispensed with, some two or three years ago. The pole was evidently used in the Druidical ceremonies, since it is so used in the East to the present day, and was held in such vogue by the Irish to a late period, as shall be hereafter shown.

In most places the poles of Baal's day were, like the Baal's fire, set up on midsummer-day; and these are the poles that can be best described by personal observation, though there is sufficient living evidence to testify to the amount of apparently meaningless mummery exhibited in connection with the poles of La Bealtine. It must be observed that the poles set up on St. John's day were always erected where fairs, "patterns," or any other merry-makings took place; perhaps the assemblies were originally instituted in consequence of setting up the poles in those places. The midsummer-pole was always called craebh, and was dressed with considerable taste with flowers and silk kerchiefs and ribbons; it was generally as lofty as the mast of a sloop, and on its top a small basket of cakes or gingerbread, and a large bunch of parti-coloured worsted garters were tied. The best musician attending the assembly was always selected to perform at the foot of the craebh, or pole; and the best dancers vied with one another for the honour of winning the gingerbread and garters—the young man got the garters, and the lady the gingerbread. The winners were held in as high estimation as if, in days of yore, they had won the first prize at the Olympic games; for they were said—"gur bhuain siad an chraebh as far an aenaich," i.e., that they bore away the prize from the whole assembly; and many a sweet Irish ditty resounded their praises; and it was always their own fault if they remained unmarried to contest for the next anniversary prize. It is a pity that the local clergy found excuses sufficiently strong to suppress these innocent amusements—for innocent they certainly were, in the absence of extraneous vice, since the performers knew not the origin of their diversions.

The May-pole ceremony was evidently of very ancient origin, since tradition itself does not pretend to reach it, and, therefore, conjecture as to its original use may be pardonable. A gentleman of varied learning and of splendid talents, who has made large collections of the legendary and traditional lore of the country, and taken much pains to reduce them to a system, and who, if this sketch meets his eye, as probably it shall, will kindly pardon the unwarranted use of his remarks, writes concerning the May-pole:—

"Having given much attention to the subject, I am quite satisfied that such was the fact (viz., that lakes were considered as types of the youi); for every lake in Ireland was considered, and still is, as druoidheach, and that all islands in lakes had reference to the same. In Hindostan, as lakes are types of the youi, so islands are types of the Lingam. Mountains also—surely all the Sliabh Budhs in Ireland at least—were named from the idea of this object. As to the May-pole, I give you an extract concerning India:—'Poles to represent the Lingam are set up before the houses, and, where timber is not to be had conveniently, they form large heaps of earth or mud, to represent that object.' In Ireland the same practice was observed 200 years ago, as may be seen in Vallancey's "Collectanea," vol. i., p. 123. In a description of Westmeath, by Sir Henry Piers, is found:—'On May-eve every family sets up before their door a green bush, strowed over with yellow flowers, which the meadows yield plentifully; in counties where timber is plentiful, they erect tall, slender trees, which stand high, and they continue almost the whole year, so as a stranger would go nigh to imagine that they were all signs of ale-sellers, and that all houses were ale-houses.' This passage refers directly to Westmeath, but would indirectly appear to comprehend many parts of Ireland.

"It remains, however, to be shown that the ancient Irish understood the May-pole as a type of the Lingam. In the absence of direct proof, I think we have strong inferential evidence that they did so understand it. Those who have inquired into the habits of the peasantry must perceive that absurdities, I shall not say obscenities, are either openly or covertly intended in that section of them which relates to the procuring of husbands. The search for worms—the plan of separating two of them—the use made of the knife employed for that purpose, are all, unquestionably, highly obscene, deserving of general censure, and referring to the May-pole, or May-bush, as a type of the Lingam." It is, indeed, well known that the May-bush, like the heap of mud, represented the pole in localities where timber was scarce. May-bushes are, or were, at least, some twelve or fourteen years ago, set up before almost every door in the counties of Louth, Cavan, part of Meath, and Monaghan; the custom was rather on the decline then, and, possibly, is now entirely neglected. The people could not tell the meaning of this custom, except that it was merely an ancient one; and yet, it must have had some meaning, since it was considered an omen of some misfortune should the bush droop, fall from its place, or be otherwise removed, before sunrise on May day.

It appears that on the festival of Bhavani, generally held on or about the first of May, according to the state of the moon, the May-pole custom is prevalent in the East, as may be seen by a paper in the "Asiatic Researches," by Colonel Pearse (8):—"I beg to point out to the Society, that the Sunday before last was the festival of Bhavani, which is annually celebrated by the Gopas, and all other Hindus who keep horned cattle for use or profit; on this feast they visit gardens, erect a pole in the fields, and adorn it with pendants and garlands. The Sunday before last was our first of May, on which the same rites are performed by the same class of people in England, where it is well known to be a relique of ancient superstition in that country; it should seem, therefore, that the religion of the East and the old religion of Britain had a strong affinity. Bhavani has another festival; but that is not kept by any one set of Hindus in particular, and this is appropriated to one class of people; this is constantly held on the ninth of Baisac'h." There can be no doubt that the Druidical tenets of Britain and Ireland were the same, and had a strong affinity to the religion of the East, since between the relics of it lingering both in Ireland and Britain, so close an affinity to the Hindu rites of the present day is found.

The sun was Vishnu; and Chrishna was another term in religion for the same planet, as may safely be inferred from Hindu theo-

logy, as well as from the Irish word cṡeaṙ, a name for the sun. The reason for worshipping Crishna, or the sun, by shepherds and shepherdesses in the East, is much more intelligible from the nature of the Irish ceremonies than even from that of those who actually profess that form of worship to this day. The Hindus assert that Crishna was the son of Devaci and Vasudeva; and it was found necessary to conceal his birth from the tyrant Cansa, to whom it had been predicted that a child born at that time would destroy him. He was fostered by a herdsman named Ananda, and his wife, Yasoda, who tended the dairy. The constant companions of the god were a crowd of Gopas, or cowherds, and Gopis, or milk-maids, and he is represented as spending a pleasant life among his rustic companions. Hence the veneration paid by cow-herds and milk-maids to Crishna, and the frantic rollicking of the same class of persons in some parts of England up to the present time.

On the fifteenth of Aswina, flowers were offered to Syama, or the Black, an epithet of this same Bhavani, who appears in the Calijug, as a damsel twelve years old. Analogous with this is the custom, not many years ago prevalent in some localities, of carrying around from house to house the figure of a baby or lass, apparently about the same age, on May-day. This female figure, which was usually decked out with great taste, was called baibin Bealtaine—in English, May-baby; though there are reasons for suspecting that baibin should not be translated "baby." The baibin was always carried by young girls, who usually sang the old Irish pastoral, "ċuȝamaṙ ṗéin an ṙaṁṙa linn" (we have brought the summer with us), when the procession reached any dwelling-house, the attendants used to exclaim to the persons inside, "Seo ċuȝaiḃ an ṙaṁṙa—ḃeannuiġe umlaċt ḋon t-ṙaṁṙa" (here cometh summer, do ye salute the summer), a circumstance strong enough to warrant that the baibin ceremony was a religious one, descended from the dark days of Paganism.

Though this paper has been drawn out to too great a length, it should not be omitted to state, that such as assembled at the bonfires on midsummer-eve, were wont to dance around them, and, as it were, in imitation of the old Druidical custom of dispensing the sacred fire to the people, each person carried home a lucky coal or ember from the bonfire. The same custom is said to have prevailed at the Baal-fires in Dublin about a century ago. This bonfire dance is analogous with that performed by the Ammonian priests round a large fire in honour of the sun. Bryant (vol. i. p. 336) says:—"The Ammonian priests used to dance round a large fire in honour of the sun, whose orbit they affected to describe. At the same time they exhibited other feats of activity, to amuse the votaries who resorted to their temples. This dance was sometimes performed in armour, especially in Crete; and being called Pyrric, was supposed to have been so named from Pyrrus, the son of Achilles. But when was he in Crete? Besides, it is said to be practised by the Argonautic heroes before his time. It was a religious dance denominated from πυρ (fire), with which it was accompanied." It is very probable that dances similar to those of the Ammonian priests had been anciently practised at May and midsummer fires, and degenerated to the common country dances; for old folk used to relate that rustic performers, armed with a pair of cudgels, used to go through a kind of military dance with great dexterity, around bonfires, May-poles, and craebhs. It was called, "Colla Ciotach's march," and generally supposed to have been introduced by a member of the MacMahon family, named Colla Ciotach, or Colla the left-handed; but the supposition appears to have been erroneously founded; for none could tell on what occasion it was invented, or even when this Colla himself flourished. Whether or not this military dance was the same as the "Droghedy dance," cannot be exactly determined, since neither ever came under my personal observation. A gentleman who has had an opportunity of collecting many wanton orgies which disgraced wakes in Munster, says:—"The highly obscene manner of the performance of the 'Droghedy' is very objectionable: in it one party is supposed to be killed, whereupon the music becomes plaintive; but when this party revives every symptom of rejoicing ensues. I may remark concerning this dance, that each performer uses two short sticks, and in a Hindu painting, Crishna is represented dancing, with a stick in each hand; he is depicted nine times—once with each of his nine Gopis. In this curious picture he plays a flute sitting in the centre, the performance being enacted by the Gopis and himself. To return to the 'Droghedy,' it is the Morris-dance, which I have seen performed in Portugal and England—the same in tune and action. The common notion is, that it was introduced into those countries by John of Gaunt, son of Edward III., but I think it was practised in both England and Ireland before the Romans came to Britain."

Tradition also relates that females used to perform on these occasions as well as men. The principal female was called Amiud shugach, and used to dress in a very fantastic costume, and perform a very frantic, meaningless dance. This character has long since ceased to perform her merry pranks in Ulster, where the practice is said to have principally prevailed. It may be remarked that the title Amuid bears a close resemblance, both in character and name, to the Amida of the Ethiopians, around whose statue they were accustomed to dance. Here we come again to sun and moon associations; for Budda and Amida are the principal deities of the Siamese, and generally supposed to have been the sun and moon.

THE ORIGINAL MRS. GRUNDY.

Everybody knows that "What will Mrs. Grundy say?" is a question which corresponds to "What will general gossip say?" But few people know anything about Mrs Grundy herself.

The character of Mrs Grundy originated in Thomas Morton's comedy of "Speed the Plow, which was first acted in London in 1798. The garrulous old lady does not appear upon the scene at all, but is often mentioned by Dame Ashfield in her conversations with her husband, for she is jealous of Mrs Grundy's good luck. Farmer Ashfield, quite exasperated, exclaims: "Be quiet, will ye? Always dinning Mrs Grundy into my ears! What will Mrs Grundy say, what will Mrs Grundy think? Canst thou be quiet and leave her alone?"

The audience took up the cry, "What will Mrs Grundy say?" and the invisible Mrs Grundy began to be considered a garrulous and critical old woman, typical gossip of the town.

A capital story about Lord Kelvin is told by Dr. Gilman, president of John Hopkins University, Baltimore, in "Scribner's Magazine" In 1884 his lordship (then Sir W. Thomson) gave a course of addresses at the University. "The lectures," says Dr. Gilman, "went on from day to day upon topics that occurred to the lecturer, or were suggested by the questions of his hearers. Everyone capable of following him was enchanted. 'How long will these lectures continue?' asked one of the audience. 'I do not know,' replied Lord Rayleigh, who was a listener, 'I suppose they will end some time, but I confess I see no reason why they should,'"

OUR WEEKLY STORY

HOW GAFFNEY BROUGHT THE LETTER.

Perhaps the story I have to tell is not really a story at all. It is an incident in the career of James Gaffney, marine postman; not an every- day incident, to be sure, but none the less true. Indeed, the facts of my story may be found in a certain volume of the Post-Office Department Reports for the year 189—.

The tonnage which passes through the Detroit River in a year is enormous. Huge, lumbering freighters bound for Cleveland and Buffalo steam lazily through the river from the opening of navigation in the early spring until the forming of the ice in early winter, bearing their loads of timber, ore, and grain from Duluth, Sault Sainte Marie, Escanaba, and other great shipping points of the north.

Seldom do these "freighters" touch at Detroit. But mail is sent to them, and this mail the United States Post Office Department undertakes to deliver. As all boats pass Detroit bound for the east, whether they stop or not, Detroit has become their post office, and Gaffney is the postman.

In a little launch named the Florence B., with no companion but old Thomas Scoggins, the engineer, Gaffney, has these ten years past, from the opening of navigation until its close, bobbed out on the river through sleet and snow and rain, amid crunching, floating cakes of ice to deliver his mail. Tourists on board the big passenger steamers bound for the famous resorts of Northern Michigan have often watched him when, on the approach of a big freighter down or up stream he has slipped off the launch into the little rowboat tender, and pulled sturdily into what seemed the direct course of the lofty ship.

Then they have seen him hook a bucket containing the mail to a line thrown him from the dock of the freighter. Two minutes later they have seen the rowboat drift back behind the vessel and attach itself to the launch, over the rail of which Gaffney would clamber, to await the coming of another boat.

It is a pretty performance—that is, in the daylight and summer. But at night, or when the ice has just broken up, or the autumn rains are thick and heavy, his work is attended by many dangers. For instance, a line might part; or he might be run down by the very steamer he seeks to serve; or a cake of ice might break up his boat.

But it was none of these accidents that befell him when he sought to deliver a letter on a memorable March day a few years ago.

At ten o'clock on the morning of that day Thurber, the receiving clerk of the Detroit Post Office, entered the postmaster's room with a long, yellow, unstamped envelope, which he tossed upon his chief's desk, remarking as he did so, "There's a nice job for Gaffney, with the river full of floating sponge ice."

Postmaster Stevens took up the envelope and glanced at the address, which was this—

THOMAS CROWLEY, Esq.,
Third Assistant Postmaster-General,
Down Bound Str. "North Wave,"
By Marine Post. Detroit.

In place of a stamp in the upper right hand corner, the envelope bore the clause defining the penalty for its use for other than official business. It was, however, neither the address nor the clause that interested Postmaster Stevens, but rather the one word "Sure," heavily underscored, followed by three exclamation points, that stared up at him from the lower left hand corner of the yellow envelope. He regarded that word curiously for a moment, then glanced out of the window and up at the leaden sky.

"It'll be a dirty job for Gaffney, and no mistake," he said. Then the regard for duty brushed aside all other considerations, and

pushing the letter across his desk, he pressed a button at his elbow.

"Tell Gaffney I want to see him," he said to the clerk who answered the ring.

"Yes, sir."

The postmaster looked up from the work that engaged him as Gaffney entered a moment later.

Gaffney is not a handsome man. His head, slightly bald, is set low on his narrow shoulders. His thin red beard extends down to the tip of his chin, and is thinnest at the point it makes there. His moustache is scraggly, but neither beard nor moustache serves to hide the firm jaw and the straight determined mouth. His blue eyes are clear and set wide apart, and his arms are of extraordinary length; when they hang lax the tips of his fingers almost touch his knees.

As Gaffney stood just within the swing of the door, he removed his round-crowned cap and fumbled it awkwardly.

"Gaffney, look at this." The postmaster held out the yellow envelope. The postman crossed to the desk, took it, and glanced indifferently at the address.

"Well, sir?" he said, lifting his eyes and handing back the letter.

"You've got to deliver it, Gaffney," the postmaster replied, quietly. "I'm sorry, but there isn't any way out of it that I can see. It appears that the "North Wave" is the first boat down. How Crowley happens to be on her I don't know, or care, for the matter of that. I wish he weren't, but he is, and this letter must be delivered, that's all. You notice it's marked 'Sure'?"

"Yes, sir. When's she going to pass? Have you heard, sir?"

"No. Here, telephone the marine reporter and find out." The postmaster pushed the desk telephone toward the postman and listened attentively to the one-sided conversation that ensued between Gaffney and the marine officer.

"What do they say?" he asked, as Gaffney lowered the receiver.

"She left the Soo on the twenty-sixth, at noon. They say she ought to pass about five."

"That's all right, then. How's the Florence B?"

"That's just it, sir, Gaffney replied, a little frown gathering on his forehead. "They said she'd be ready yesterday. We weren't expecting navigation would open before the first, and we didn't hurry 'em. Maybe she's ready, but I doubt it."

"Well, what will you do if she isn't ready?" inquired the postmaster, eagerly.

"Have to go out in a small boat," was the indifferent reply.

"And the river full of ice!" the postmaster exclaimed.

"Oh, it ain't bad. I went down and had a look at it this mornin'," Gaffney said. "The river above is free, and what ice there is is passin' down fast. Probably pretty bad out in Lake Erie, but I guess a big boat as big as the North Wave could get through. She wouldn't try if she wasn't pretty certain of makin' Cleveland. Of course, there's the honour of bein' the first boat of the season, but she wouldn't take chances for that."

"Well, you'd better get right up to the shipyards and telephone Scroggins, and be all ready," the postmaster suggested.

"Yes, sir," and Gaffney withdrew as quietly as he had entered. It was shortly after half past two that afternoon when he returned to his chief's office.

"Well?" the latter inquired.

"I guess the Florence B. will stand it. They ain't through with her yet, but I guess she'll do. I saw Scroggins. He's ready. We can't take a rowboat. It wouldn't do no good, come to look it over. She'd only get jammed between a couple o' cakes, an' we couldn't no more move her than we could a house.'

"All right, Gaffney; just do your best, that's all," the postmaster said. "You don't have to be told that when the department sends out a letter to be delivered 'Sure,' it means it."

"No, sir," Gaffney replied, turning away.

"He'll do it!" Stevens muttered, bending over his desk.

He did; and the extraordinary manner of the doing makes this story.

When Gaffney left the post office that afternoon, he slouched off down Wayne street towards the dock. He had arranged with Scroggins to run the Florence B. down stream to Wayne street. The plan, further, was to make for the middle of the river and wait.

Snow was in the air, and the sky was leaden. Reaching the dock, Gaffney gazed off up the river. He made out the launch steaming slowly down and hugging the shore; then he shifted his gaze out to midstream and shivered. Broken, jagged cakes of ice bobbed, overlapped and splashed as they slid upon and off one another. It was rotten ice, dirty white in colour, and Gaffney knew it was as porous as a sponge, and almost as light.

The trim Florence B. came alongside the wharf, and Gaffney jumped down upon her deck.

"Is she making it all right, Tom?" was the first question he asked the grizzled old man who had poked his head out of the window of his little engine and wheel room.

"To be sure," was the reply. "Easy as clear water, but I don't like it, all the same."

Gaffney laughed.

"I suppose we'd better get right out to midstream and wait, and trust to heaven she don't run us down," the old man added.

"I guess she won't run us down," Gaffney replied; "not us, Tom!"

The other shook his head. "Well, 'tain't just the job I like!" he grumbled.

To the precise middle of the stream they made their way slowly, among the myriad cakes of crunching, crumbling ice.

Gaffney gazed off up the river to the lower point of bleak, gray Belle Isle. "Little ahead," he called. "We ain't quite in the channel yet." He waited a moment, then added, "We can afford to get right in the way; she won't be comin' down fast, likely."

In the middle of the channel Scroggins turned the launch and steamed lazily upstream.

"Get a pretty good idee now what it would be like up to the North Pole!" Gaffney shouted.

"Detroit's good enough for me!" Scroggins called back. At the point of the island he turned the launch and steamed slowly down, endeavouring merely to hold the little craft steady in the current. As he made another turn, crunching through the breaking ice, the huge, black hulk of a broad-beamed freighter loomed up in the gray above.

"Here she comes," Gaffney cried. "Get back up as near as you can to the ferry course."

"All right!" came the answering cry, and the launch forged ahead mightily. Scroggins held the boat steady in the course. Nearer and nearer came the high, black boat.

"She looks big!" he shouted.

"I should say so!" Gaffney called back. And it was not an instant later that he realised something had happened to the launch. He cried, with great excitement:

"Tom! Tom! What's the matter? We're turnin' and driftin' down stream!" As he spoke the old man's head again came out of the little window. His face was strangely pale. He gazed round a moment, then drew back. Gaffney heard an ominous crunch, followed by a report, sharp and snappy.

"She's busted her steerin' gear!" Scroggins cried.

The huge freighter was not six rods away up stream, and her approach was steady. She gave no sign of lessening her speed.

The engineer's face was at the window again. "What are you doin'?" he screamed, for as he looked he saw his companion strip off his gray coat. There was no reply. "Gaff!" he shouted. "What are you goin' to do?"

The man replied with a keen note of determination in his harsh voice, as he folded a long yellow envelope and placed it between the sweat-band and lining of his hard cap: "I'm goin' to deliver this letter!"

And before the old engineer could rush on deck and hold him back, Gaffney had flung both legs over the low rail of the launch, and clung for an instant, half his body in the icy water. A broad cake of the dirty white ice was floating alongside, and just as Scroggins reached the rail and stooped to seize the postman's hands, Gaffney released his grip. He clutched the cake, and Scroggins saw the distance between the man in the water and the drifting Florence B. grow greater and greater each instant.

"Gaff, you'll freeze!" he cried. There was no answer. He changed his cry to one of encouragement. "Can you make midstream?"

"I can try," was the half-smothered answer.

Scroggins, forgetting his own position and the uselessness of the launch, gazed in wonder at the man in the water. Gaffney's head and shoulders were above water, and his cap was jammed low about his ears. Scroggins saw a big cake of ice bearing down upon him. "Look out on your left!" he screamed. With a great confusion of water, the postman kicked his own cake clear of the other, and for the moment was safe.

The freighter was now hardly two rods away. Gaffney seemed directly in its course. He was being carried down stream by the current, but his own efforts made the cake go at an angle and bear him into the channel. Scroggins screamed. He saw that the men on board the freighter had taken notice of the launch, and—yes, and of the man in the water. He saw several persons running along the deck of the big steamer to the bow. And then he heard that fine cry sung out across the ice, "Watch the line!" and saw the rope whirl through the air and fall, weighted by the "doughnut" life-preserver that it carried.

The old man had expected to see the big cakes of ice that were thrust aside by the freighter in its passage tossed upon the one to which Gaffney clung. But with fine presence of mind, the postman seemed to have anticipated this and conducted himself accordingly.

The launch was so far down stream and toward the shore now that the old man, standing at the rail, could not see where the line had fallen, and because of the piled ice he could not see his associate. But he knew he was out there somewhere, for the freighter had slackened speed. Then he heard a cry, and turning, saw that a puffy little tug had put off from the nearest dock and was making for the launch. He realised that his own position had been observed, and that the drifting of the mail-boat had occasioned alarm.

He turned again to the river. Of a sudden the pile of ice out there gave way, and he made out Gaffney, still in the water. He saw him lift one hand, and then, as he watched breathlessly, beheld him raise himself, as it were, over the cake to which he had clung. And then the old man fell involuntarily upon his knees in thankfulness, giving way beneath the strain, for he saw a strange, long, kicking thing pulled up the vertical side of the freighter and over the stern rail. And a moment later the tug bumped resoundingly into the launch.

What happened on the North Wave as that long, kicking thing fell over the rail is a matter of lake and river history.

Almost frozen, Gaffney was carried down into the engine-room. Rough but willing hands, working under the direction of the big captain, had quickly stripped the soaking gray clothes from his body.

Above him bent a tall, full-bearded man, whom he heard say, as he opened his eyes, "What under the sun was the matter out there?"

Gaffney's breath hissed as he drew it in,

and he shook as with the ague. He felt many pains, but he was hot and sleepy. Then he opened his eyes. He looked up and started.

"Crowley," he muttered. "Where's Crowley—assistant post—" He got no farther. He closed his eyes again.

The bearded man was on his knees now. "I'm Crowley," he said. "What is it?"

The man lying there on the blanket spread upon the engine-room floor made an heroic effort to tear off the cap, that till now no one seemed to have noticed. The fingers of the hand he raised touched the vizor; that was all. The arm fell back, a groan escaped his purple lips, and his mouth opened.

Cowley snatched off the cap, saying as he did so, "I guess it was too tight; it seemed to hurt him."

As he set it on the floor he happened to glance inside. He saw a folded yellow envelope between the band and the lining, and removed it gingerly. He spread it out and saw it was addressed to himself. Hastily he tore open the envelope, and drew out the letter it enclosed. He ran his eye rapidly down the single sheet. He looked up into the eyes of the men about him, then down at the still figure on the floor.

He was smiling, but mistily. "Boys," he said, with a little catch in his voice, "he's lost his life delivering this letter to me!" He hesitated a moment, looking down, then added, "Here's a sample of the men that do our work!"

But Gaffney had not lost his life. As he is wont to say, "The idea of me gettin' drowned in the river! Why, that wouldn't be an novelty!"

They took him on to Cleveland. It was Scroggins who reported his achievement to the postmaster that evening, and it was the postmaster who gave the story to the morning papers later.

As for Gaffney, they sent him back from the Ohio city that night, his life restored by the severe but kindly treatment they had given him; and he entered the postmaster's office early the next morning, sheepishly, to report for duty. And all the postmaster did was to go to him and take his hand and say, "Gaffney, I knew you'd do it." Whereat Gaffney grinned, and looked more sheepish still.

"TOM MOORE."

Maybe it takes a poet to describe another poet. Gerald Griffin, the Irish poet and novelist, once wrote a precious letter to a friend, giving an account of a visit to Thomas Moore.

"In the morning," wrote Griffin, "we set off to Sloperton in a drizzling rain, but through a most delightful country; such a gentle shower as that through which Moore looked at Innisfallen—his farewell look. And we drove away until we came to a cottage of gentility, with two gateways and pretty grounds about it. We alighted and knocked at the hall door; there was dead silence, and we whispered one another; my nerves thrilled as the wind rustled in the creeping shrubs that graced the retreat of Moore. I wonder I ever stood it at all, and I an Irishman, too, and singing his songs since I was the height of my knee.

"The door opened, and we were shown upstairs, where we found our hero in his study, a table before him, covered with books and papers, a drawer half open, and stuffed with letters, a piano, also open, at a little distance, and himself, a little man, but full of spirit, with eyes, hands, feet, and frame forever in motion, looking as if it would be a great feat for him to sit for three minutes quiet in his chair. I am no great observer of proportions, but he seemed to be a neat made little fellow, tidily buttoned up, young as 15 at heart, though with hair that reminded one of the Alps in sunset; not handsome, perhaps, but something in the whole cut of him that pleased me. Finished as an actor, but without an actor's affectation; easy as a gentleman, but without some gentlemen's formality; in a word, we found him a hospitable, warm-hearted Irishman, as pleasant as could be himself, and disposed to make others so. Need I tell you that we spent the day delightfully, chiefly in listening to his innumerable jests and admirable stories and beautiful similes, beautiful and original as those he throws into his songs and anecdotes that would make the Danes laugh?"

THE PARISH CHURCH OF THE OLD IRISH PARLIAMENT

By C. LITTON FALKINER.

(Copyright: All rights reserved.)

III.

Dr. Travers' successor, the Rev. Robert Dougatt, was a nephew of Archbishop King, by whom he had been appointed Archdeacon of Dublin, and through whose influence he was afterwards nominated to the Precentorship of St. Patrick's and the Keepership of St. Mark's Library. Dr. Dougatt's ministry lasted only three years, and is noticeable only as reviving the bygone connection between St. Andrew's and the Cathedral in the person of its minister. It is curious that he was also appointed Vicar of St. Mark's, notwithstanding the recent Act of Parliament. On Dr. Dougatt's death in 1730 the Rev. Alexander Bradford commenced an incumbency of twenty years, which, although the new Vicar was not a man of special distinction, is remarkable from our present point of view as having witnessed the first formal acknowledgment of the existence of close official relations between the parish of St. Andrew's and the Irish Parliament.

Neither the journals of Parliament nor the records of the parish inform us at what precise period the practice grew up under which the church of St. Andrew's came to be used as the place of worship of the Houses of Parliament on important public occasions. The Irish Parliament first met within the limits of the parish in 1661, when the first of the Parliaments of Charles II. was opened at Chichester House. That building was in 1674 leased by the Crown from its then owner, Dr. John Parry, Bishop of Ossory, for the use of the Parliament, but inasmuch as Charles II. summoned no second Parliament, from the dissolution of the first one in 1666 to the end of his reign, it is impossible that the church, which was not completely built till 1673, could have been so utilised prior to the Revolution. William the Third's Parliament of 1692 lasted for seven years, during all which time it continued to sit at Chichester House. But neither during this Parliament nor during those called by Queen Anne and George I. is there any evidence that the church was used for State purposes; and it is possible that the practice did not begin until after the demolition of Chichester House, in 1728, and the erection of the Parliament House. But at whatever precise date the custom originated there is no doubt that long before the first half of the eighteenth century had run its course St. Andrew's had become the recognised place of worship of the two Houses, and that it had become customary for the House of Commons to attend in state on certain anniversaries. The earliest mention of such attendance appears to be in 1733, when the "Commons' Journal" contains the entry under date November 5—"The House met in order to go to church, and then adjourned until next day," the occasion being, of course, the commemoration of the Gunpowder Plot. The entry does not mention St. Andrew's, but it was almost certainly the scene of the service, for in the same month official recognition was given to the claims of St. Andrew's to be the parish church of Parliament in connection with the petition of Dr. Bradford to be compensated for the loss of Ministers' money through the rebuilding of the Parliament House and the consequent removal of several houses which were cleared for the purpose, and which had formerly contributed to the parochial assessment. At the instance of Mr. Wesley, afterwards the first Lord Mornington, and grandfather of the great Duke of Wellington whose residence, Mornington House, stood until the other day in the parish, and who was an active member of St. Andrew's Vestry, as well as of the House of Commons, Parliament undertook to make good these losses, and to pay the assessment to the parish for the future. From this period allusions to the attendances of the House of Commons at St. Andrew's are frequent in the journals, and in the year 1745 there occurs as many as three entries, in each of which the church is specifically mentioned. On October 9, 1745, Dr. Marmaduke Phillips was desired to preach before the House of Commons at St. Andrew's Church, Dublin, on the 23rd of that month, being the anniversary Thanksgiving Day for the deliverance from the horrid rebellion which broke out in this kingdom on the 23rd day of October, 1641," and on the 24th Mr. Phillips received the thanks of the House for his excellent sermon on the occasion, and was requested to print the same. The Rev. Benjamin Barrington received a like command and a like compliment for a sermon on November 5th following; and on November 6, in a petition to Parliament for assistance in re-roofing the church, the parishioners prayed that, "inasmuch as the House doth on all public occasions resort to the said Church of St. Andrew's, the House may please to take this petition into consideration." The Committee to which the petition was referred held that the claim of the parish had been proved, and a sum of £500 was accordingly voted in aid of the work. This was the first of a series of contributions by Parliament in aid of the repair or restoration of the fabric of the church, in all of which the position of the parish in relation to Parliament was fully acknowledged, and when in 1794 it was found necessary to rebuild the church the petition for help from the Commons besought "such aid as will enable the parishioners to accommodate the House in a manner suited to its dignity," inasmuch as "the House of Commons on public days compose a considerable part of the congregation." That the members of the House of Lords also attended appears from the language employed in an address presented to Lord FitzGibbon, the Lord Chancellor, whose aid was solicited on the ground of his occasional presence in the church in his capacity as Speaker of the House of Lords.

The closeness of the connection between Parliament and the parish is traced with great fulness in a petition presented to the House of Commons of the United Parliament on January 22, 1805, by Mr. Foster, the ex-Speaker of the Irish House, in which help was sought to enable the parish to complete the restoration of the church, begun in 1793. This document opens with the assertion that "Hitherto, and until the Act of Union, both the Houses of Parliament of Ireland were situate in the said parish, to the church of which the Speaker and members of the House of Commons always resorted on public and solemn occasions." It recalls the instances already enumerated of the extension of Parliamentary patronage to the parish, and cites the reports of several Committees of the Irish House in 1796, 1798, and 1799, in which financial assistance was rendered on the express ground that the parish could not, by its own

THE IRISH PARLIAMENT HOUSE.

WITH VIEW OF DAME STREET 150 YEARS AGO.

exertions, render the church fit for the reception of the parishioners and members of the House. The work of rebuilding the church was spread over a period of fourteen years. Commenced in 1793, the work was frequently interrupted for want of funds, notwithstanding contributions of £500 and £1,000 respectively from Parliament, and in 1798 was entirely suspended during the period of the Rebellion. The original intention had been to rebuild the church de novo from the foundation on an entirely fresh design, and plans drawn by Mr. George Hartwell on this understanding were approved by the Vestry. It was soon evident, however, that the funds for so extensive an undertaking could not be raised, and, it being ascertained that the old walls from below the level of the windows were in a perfectly sound condition, it was decided to retain the original shape, and the Round Church on the plan designed by William Dodson a hundred and thirty years earlier was thus preserved. Hartwell having resigned his commission as architect, the work was confided to Francis Johnston, by whom the new front was designed. The interior arrangements, which all authorities concur in eulogising as extremely handsome and convenient in all respects, save as to the acoustic properties of the building, were carried out by the father of the celebrated novelist, Charles Lever.

But even to this reduced scheme the resources of the parish were soon found to be inadequate, and it is doubtful whether the church would ever have been restored but for the munificence of the Imperial Parliament on the one hand and a fortunate windfall to the parish on the other. The petition presented by Mr. Foster was favourably entertained, and a sum of £6,000 voted for the completion of the church. About the same time a suit which had been long in progress respecting the allocation of the sum paid into the hands of trustees by the Wide Streets Commissioners in respect of the old churchyard was brought to a conclusion, the parish establishing its title, through the lapse of the lease formerly given to Sir William Fownes, and the fund being divided by decree of the Lord Chancellor between the Vicar and the parish. The money thus made available was devoted to the building fund, and, so aided, the work was at last brought to a completion fourteen years after its inception, and the church opened for Divine service on March 7, 1807, in presence of the Viceroy and a distinguished congregation. The total cost, inclusive of the organ and of the fine statue of St. Andrew executed by Edward Smyth, which long stood over the entrance, but which now, in a much battered condition, lies in a corner of the churchyard, amounted to £22,000.

Long before the building could be finished the Parliament on whose honourable connection with which the Parish of St. Andrew's will always pride itself had disappeared. But for many years the church continued a valuable memorial of the days when it was the Parish Church of the Houses of Parliament. Through the graceful act of the Viceroy, Lord Hardwicke, the parish was presented with the handsome gilt candelabra which had hung in the Irish House of Commons. This relic now adorns the Examination Hall of Trinity College, to which building it was fortunately transferred, in view of some contemplated repairs to the roof of the church, a year or two before the great fire of January 9, 1860,

Space is lacking to dwell on the history of the parish under the rule of its successive Vicars in the last half of the 18th century. Dr. Bradford was followed by Isaac Mann, afterwards eminent as Bishop of Cork, who after seven years was succeeded in turn by Dr. William Brown, and the Hon John Hewitt, Dean of Cloyne; nor is it possible to exhibit here the mode in which the Parish Records illustrate life in Dublin during the 17th and 18th centuries. Many particulars appear in them which throw light on the social condition of the city. The parochial regulations for the relief of the poor, especially a plan for lodging beggars according to the parishes to which they belonged, which is the subject of an animated paper in Dean Swift's Miscellaneous Writings, occupy several entries. There are also many references to the mode of lighting the streets, to the inefficiency of the watchmen, and the frequency of street outrages, and other like matters. But these and other topics, such as the contents of the parish registers, the eminent persons connected with the parish, and the charity sermons of Dean Kirwan, who preached some of the most eloquent sermons in St. Andrew's, cannot be set forth here. Equally impossible is it to recall the story of St. Andrew's in the 19th century. But it is the less necessary to do so from the fact that by the close of the 18th century the parish had assumed very much of the appearance it presents at present. For though a succession of handsome banks and other buildings have altered the south side of Dame street, the thoroughfares are in the main unchanged. From an archæological and antiquarian point of view the more recent history of the parish has no special claim on our attention; while the one conspicuous event in parish history for which the 19th century is memorable, the destruction of the old Round Church by fire on the morning of Sunday, January 9th, 1860, is well remembered by many persons who would resent being called old. It must suffice to mention for the benefit of younger persons that the existing building, which replaced the Round Church, was built at a cost of above £10,000 from the design of Messrs. Lanyon, Lyne, and Lanyon of Belfast, that its foundation was laid by the Viceroy, Lord Carlisle, on August 11, 1862; and that it was consecrated on St. Andrew's Day, November 30th, 1866, by Archbishop Trench, in presence of the Lord Lieutenant, the Duke of Abercorn.

Some apology is due to the readers of the "Dublin Penny Journal" for a paper in which, from the length of the record which this parish can boast, it has been necessary to summarise in the baldest way much that might well seem to some more interesting than the rather dry details chiefly dwelt upon. But its main object has been to interest some who may not hitherto have given much attention to such subjects in the antiquities of a peculiarly attractive part of Dublin; to indicate a few of the many sources of interest which lie but a little way beneath the surface of our crowded streets; and in doing so to stimulate in however small a degree an intelligent and sympathetic interest in the story of our city.

[THE END.]

THE

PANTHEON OF THE GAEL.

BY L. McMANUS,
Author of the "Silk of the Kine," "Lally of the Brigade."

THE mythology, as we know it, of the pagan Gael has not that distinctive form or clearness of detail that we find in those of Greece and Rome and the Teutonic races. There is, in fact, as first sight, little or no trace of a circle of gods regarded as such, where each divinity is equipped with its special power and attribute. And the reason is this: Pagan Ireland dethroned her gods in the course of centuries, and turned them into kings and heroes, races and nations, a process exactly opposite to the almost universal one of turning the hero into a god.

There are three principal cycles in early Gaelic literature, which are known as the Mythological, the Red Branch, and the Ossianic. In the first we have definite reference to the gods, who appear sometimes in the fullness of their power, sometimes already half euhemerised, and have become races and mortals, but races and mortals who are still gifted with supernatural powers and surrounded by the mysterious. One of the earliest of these races were the Formorians, pirates and ill-doers, small, dark men, who were ultimately conquered by a second race, the Tuatha De Dananns, who in their turn were subdued by a fresh wave of immigrants, the Milesians. Now every Gaelic family can trace itself to one or other of the three sons of Milesius, Ir, Eber, and Eremon, or to his brother Ith; but no Gaelic family has ever claimed a descent from the people of the Tuatha De Danann. The latter—Celtic scholars show us—were the gods.

We are told in our early literature that they had the gift of magic, and used it to prevent the landing of the Milesians, but were finally driven to the hills and lakes and enchanted dwellings under the raths and the waters. In their battles with the Formorians, the eternal strife between the powers of good and evil, of light and darkness, is portrayed, and in the defeat of the dark, evil men the ultimate triumph of light foretold.

Here, then, we find the gods; vague, half divine, half human, their divinity showing through the euhemerism to which they have been subjected. Dana, "mother of the gods," known, too, as the Morrigan (Great Queen), was chief war-goddess of Erin. She appeared in the camp before the battle with helmet and shield, bearing two spears in one hand, and gave a shout which was like that of ten thousand men. Sometimes the heroes saw her in the form of a red or grey backed cow; sometimes she came as a beautiful woman, fair and blue-eyed. The hero, Cuchulin, met her in her chariot, her eyebrows red, a crimson mantle on her shoulders, which, falling between the wheels, trailed on the ground. Her metamorphoses were many; she appeared as a white red-eared heifer, as a black eel, as a rough grey wolf. Twelve principal mountains in Ireland were ready to do her bidding and fall upon the Formorians. The Irish-speaking peasant to-day, as he points to the two hills of Slieve Luachra, in Kerry, will tell you that they are "Da chich Danainne," the two Paps of Dana.

Her husband was the Dagda, "Good God," who played an important part in the mythological cycle. He fought the Formorians, and did mighty feats. Once he went to their camp to demand a truce, and appeared there "in a less dignified but more clearly mythological position."* On leaving, the wheeled fork he bore, as it trailed behind him, left a deep track, "large enough to mark the frontier mearin of two provinces." He brought men the various foods of earth, which he carried in a caldron slung on his back; when he played on his harp figures sprang from it, the months and seasons with their gifts. Another god was Lugh-Lamfada (the long-handed), who is called the Ildana, master of arts, and is the sun-god, giver of life and fertility. It was he who slew Balor, the Formorian, of the Evil Eye, whose glance killed men. Lugh had a hound brilliantly white, which changed periodically into a dark yew tree. Sometimes the god rode on the steed of the god of the sea, Mannanan Mac Lir clad in the armour helmet of Manannan, so that he could not be wounded "under, over, or through it," and when the helmet was removed his face and front were dazzling. He carried, too, a mighty spear, from whose head fire rushed. To prevent it slaying all who approached, it had to be dipped in a mixture made of mandrakes and poppies. This sun-god of the Celts has given his name to two Continental cities, Lyons and Leyden.

The god of the sea, Manannan, was the son of Lir, that Lir whom Shakespeare has made a King in Britain. The Isle of Man—the Isle of Manannan, preserves his name to-day. He was master of the ocean, and knew where the weather lay in the sky. He drove a shining chariot across the sea, "which to him was a flowery plain." The sea is spoken of in the sagas as "the land of Manannan," the land where Tir-na-n'og was to be found, and the magic isles of delight. He possessed a sword, which he gave to one of the heroes, which left "no relic of stroke or blow behind." Cormac, King of Cashel, in his glossary written in the ninth century, says that he was "the sea's son—Mac Lir, that is, son of the sea."

The god of love and youth and beauty was Angus Og. The Dagda was his father, and his dwelling was at Brugh, on the Boyne. He went on the wind accompanied by three birds, invisible to mortals, but whose divine singing set the heart on fire. These birds were his own kisses, to which he had given form; and he carried a golden lyre from which he drew enchanting music. He came to the aid of Diarmuid of the love spot, one of the heroes of the Fiana, and when later, Diarmuid was slain, brought his body to the Brugh, and sent a soul into him so that he, the god, might talk to the hero every day.

Dianacht was the god of health, the healer of men's bodies. Cormac calls him "the sage of the leech-craft of Ireland." He is one of the five gods who came together to consult how they might defeat the Formorians. Ogma was of the number, whose attributes were strength and eloquence. To Ogma the Gael ascribed the invention of the Ogham writing. He is the same as Ogmios, mentioned by Lucian, who saw him depicted in Gaul as an old man with a smiling face, leading a crowd by golden chains, which were hung round their ears, and the ends fastened to his tongue. In Ireland he was called Ogma grian-aineach, Ogma of the shining face. At the battle of Moytura, he fought against the Formorians, and there rolled a stone too heavy for eighty pair of oxen to move.

Some of the gods had kingdoms over the men of the sidhe (fairies). Bove, son of the Dagda, ruled in Munster, and Orchill in Connaught. Brigit, "very noble," was the goddess of the poets, and daughter of the Dagda. "She was a goddess," says Cormac, "whom poets worshipped, for very great and noble was her superintendance, whose sister was Brigit, woman of smith-work, and Brigit, woman of healing, namely goddesses." The Gallo-Roman inscriptions found in Great Britain to Brigantia are to this goddess. Cliona was queen of the southern gods; and there are numbers of lesser divinities, lovely immortal women, and sons of the gods, each of whom had their place and power. Among the queens are Eire, and Fola, and Banba, names that have been given to Ireland. Other war-goddesses were Babh, Fea, Macha (of whom it was said she was mast-feeding, "meaning the heads of men who were slaughtered"), and Neman. They, together with Dana, show greater signs of antiquity than the Norse Valkyrs, and have been thought to personify the emotions aroused in battle.

A belief in rebirth was a feature of the pagan Gael. Again and again the gods are re-incarnated in some hero. Cuchulin, the great hero in the second cycle, the Red Branch, was a re-incarnation of the sun-god, Lugh. The gods re-appeared, too, in the forms of animals, and there are stories of mysterious births, of metamorphoses, of immortals passing into the bodies of birds and beasts. It is round a mighty bull, in which a god is incarnated, that the saga of the Capture of the Kine of Cuilaigne (Tain bo Cuilaigne) centres. The doctrine of rebirth was taught by the Druids of Gaul to make men brave. It may have been also taught in Ireland by the Druids there.

The Gael's Elysium was Tir-na-n'og, the Land of Youth. It lay to the west among magic islands. The gods went thither, and thither, too, the heroes were enticed by the enchantment of some goddess. Sometimes a hero would be seized with a longing to sail westward and see these islands; to pass through the door of the mysterious, and behold the heart of beauty itself. From the pagan Gaelic fantasy of enchanted islands and magic voyages sprang the tale of St. Brandon's voyage towards Hy Brazil. Tennyson has also used the conception in his voyage of Maelduin. Here is a picture of the Land of Youth as shown in one of our Irish MSS. The hero, Maelduin, and his companions have sailed for thirty days seeking the islands; and having passed by many, at last reach one, "around which was a fiery rampart, and it was wont ever to turn round and about it. Now in the side of that rampart was an open door, and as it came opposite to them in its turning course, they beheld through it the island and all therein, and its indwellers, even human beings, beautiful, numerous, wearing richly dight garments, and feasting with golden vessels in their hands. The wanderers heard their ale-music, and for long did they gaze upon the marvel, delightful as it seemed to them."*

The brief, elusive glimpses of the Land of Youth, the haunting memory, the nearness of the supernatural world which reveals itself for a moment, the inner beauty and mystery, as given here, are full of the Celtic glamour. There are other descriptions of Tir-na-n'og. In the "Voyage of Bran," we hear of it as a distant isle, "a lovely land on which many blossoms drop," where is an ancient tree in flower, "on which birds call to the hours." Wailing and treachery are unknown there; it is "without grief, without sorrow, without death." Crystal drops fall from the waves that wash its shore. Wealth and treasures are there. "It is a day of lasting weather that showers down silver on the land." It is a land of wondrous beauty, "incomparable in its haze." Men and women are there "without sin, without crime." The goddesses invited men to the Land of Youth. One of the conditions imposed upon mortals who set foot on those islands was that they must not return to Erin. They remained young and strong in Tir-na-n'og,

* Hyde's "Literary History of Ireland."

*Translation in Alfred Nutt's "Happy Other World."

but if they went back they fell again under the law of mortality. Ossian, the poet, in the third cycle, left his companions, the heroes of the Fiana, and followed a beautiful immortal to the Land of Youth. Three hundred years passed and the desire came to him to see Eire and the battle-champions, his comrades, again. So he returned, and old age fell on him as soon as he touched the shore. There are many references in the Irish MSS. to the divinities who invite men to Tir-na-n'og. They appeared suddenly in the king's court, and summoned the hero upon whom they had set their heart to follow them to a mysterious land where "there is neither death, nor sin, nor strife." Connla, son of Con of the Hundred Battles, was thus summoned, and though the king got his druid to drive the enchantress away by his incantations, yet she came again. Finally the prince sailed with her in her boat of pearl to the west, and no man saw him more. Bran, too, was summoned, and went on his mystic voyage. Cuchulin, the hero, as he lay on his sick bed, was called thither by the deserted wife of Manannan, and sent his charioteer to report upon the beauties of the land. Dunlang, also, the warrior, visited the magic halls within the mounds, enticed by a goddess. Murough, his friend, was of a sterner mould, and though often addressed by some lovely lady of the Sidhe, yet resisted their enchantments, and fell at the battle of Clontarf.

There are still people in Ireland who believe that men and women and children are beguiled away by the fairies to their homes in the raths and loughs and hills. The gods "are dethroned but not dead." They have become fairy men and women whose mode of life is similar to ours. But all those things that they possess are richer, more delightful, more perfect than anything that we can have. They sell and buy, marry (sometimes with mortals whom they beguile to their habitations), and make war. Their name in Irish is duine sidhe (dhinna shee)—people of the fairy mounds. One of their occupations is to kidnap mortals. The young are often taken; young women at the birth of their first children are in danger of being carried away, and young men about to marry. The old are rarely taken—and here we see the difference which the centuries have wrought between Tir-na-n'og and the fairy raths of Christian Ireland—being carried off by the fairies does not confer immortality on the person captured. The baby stolen from its mortal mother grows up in the rath, becomes mature, old, and dies. Occasionally, however, an old man may be taken to be a herd to their cattle, or an old woman for a nurse.

On certain nights it is dangerous to give water or a light or food to any person who asks for them at the door, for the stranger is invariably one of the duine sidhe. Those who give will be carried off before long. The mysterious visitant who comes to entice the mortal to the raths is seldom described as a young woman. The lovely ladies who sang their songs of enchantment in the ears of the heroes whom they wish to beguile to Tir-na-n'og, have changed their guise in the course of centuries. They have become old and withered; they dress like beggars. But they still whisper in the ears of those whom they desire a tale of a land of magic, "a land against which laughter peals," where rich and beautiful things are to be found.

The duine sidhe have been so long a power in Ireland that we can trace their influence for centuries on the thought of the Gael, and link them with the pantheon of the Mythological cycle. The word sidhe constitutes or begins the names of about seventy townlands, besides forming the designation of innumerable hills and raths. There are hundreds of place-names that tell of the days when men held that the gods of the earth built their homes in the hearts of the round green hills, or reared cities of delight deep in the bosom of the loughs. Thence they emerged to intermingle in the lives of men, some still retaining the dignity and power of the god, some sunk to mere capricious beings. Their higher attributes fade as the years pass; their actions take more the whim of mortals. But enough remains to show that they were once enthroned and ruled as divinities. The Land of Youth, whence they came, is not wholly forgotten. It lingers a vague remembrance from the past in the mind of the Gael, and Tir-na-n'og may still be found in the raths and gleaming lakes.

The study of the three cycles is one of deep interest. The traditions of Ireland, rooted in the Irish language, preserved in the ancient manuscripts, are of peculiar value. "Geographical circumstances," says a writer in the "Century."* "are such, that habits, traits, customs, laws, legends, and religious ideas, which once existed in Europe at large, are now to be found alive only in remote places like Ireland, or imbedded in such a literature as Ireland owns—one of the most wonderful in Europe." Those, therefore, who desire to obtain glimpses into the past, not alone of the Gael, but the past of the Celtic race on the Continent—a knowledge of their gods and customs—will find them in the cycles and sagas recorded in our literature.

HASSAN NAZAR (DAMASCUS).

By the gateway gray and grim
All day sits Hassan Nazar,
Till the golden west grows dim,
And above the peaks afar
Burns eve's amethystine star.

Under overhanging brows
Darkling eyes inscrutable,
Watchful, though they seem to drowse;
And a smile whose quiet spell
Holds you—why you cannot tell.

Then a voice as varied as
Barada's, that singing stream,
In whose flow as in a glass
You may follow every theme,
Interwoven dream on dream:

"Truth, Howadji! Verily!"
You who list must fain believe;
For that manner, frank and free,
Velvet voice and eyes like eve—
Soothly, they could not deceive!

How the djinns and genii still—
Errant spirits of the air—
Work their good or evil will;
Where they dwell and delve, and where
Up and down the earth they fare.

Miracles Mohammed wrought;
How the wondrous Kaaba cures;
Sapient subtleties of thought,—
Why the soul of man endures,
Hate repels and love allures.

This will he relate, and more,
For a few piasters' hire;
Flood you from his ample store,
With your hearkening heart's desire;
"Truth!"—you likeable old liar!

Nay, imagination's brew!
Fancies fettered to a star!
What, then, if they be not true?
Marvellous we know they are.
Here's your health, Hassan Nazar!

Here's your health, O, cunning one,
Smooth of lip, and deep of eye!
May your deft web long be spun!
And, albeit you love a lie,
May the Dark One pass you by!

NOTES AND QUERIES.

BOYNE VIADUCT AT DROGHEDA.

In the "Freeman's Journal" of June 10th, 1858, there appears a long letter asserting that J Barton and not Sir John M'Neill was the designer of this great work. Can any reader tell me?

ANTIENT CONCERT ROOMS.

Why is the first word in this title not spelled according to our modern usage, Ancient? Is there any curious or strange tale in connection, to account for the keeping up of this custom?

T. O'C.

CHAPELIZOD.

To the Editor "Dublin Penny Journal."

Sir.—In Mr. Julian Moore's contribution to the "Athenaeum," it is stated that Chapelizod was named from Izod, or Isolte the fair, and that a tradition exists in the village that the church tower was built by "La belle Izod." The name Chapelizod could mean "Chapel of the Izods," and the Izods, whose residence in the county of Kilkenny is named Chapelizod House, claim that the Dublin Chapelizod was named from them, just as the modern Chapel Russell, in the county of Limerick, was named from the Russell family.

Lewis says that Chapelizod is supposed to have derived its name from La Belle Isode, a daughter of one of the ancient Irish Kings, who had a chapel here; but this is absurd. Lewis makes numerous blunders re meanings of Irish place-names. Isolde or Ysonde is not mentioned in the Irish tales, but she as Isolde (Ysonde) the Fair, daughter of an Irish Queen, and wife of King Mark, of Cornwall, and the beloved of Tristram, and healer of his wound, belonged to the mythology of the Celts of Britain, while as Isolde (Ysonde) of the white hand, daughter of King Howel, of Brittany, or of Duke Florentin, and the despised wife of Tristram, and healer of his wound, she belonged to the mythology of the Celts of Brittany.

Then, Tristram, waiting for the quip to come,
"Good now, what music have I broken, fool?"
And little Dagonet, skipping, "Arthur, the King's";
For when thou playest that air with Queen Isolt,
Thou makest broken music with thy bride,
Her daintiest namesake down in Brittany—
And so thou breakest Arthur's music, too.

—Yours faithfully,

J. F. LYNCH.

NELSON'S PILLAR, DUBLIN.

To the Editor "Dublin Penny Journal."

Dear Sir.—In reply to enquiry by Mr. Thomas O'Connor, of 32 Vince street, Smithwick, Belfast, as to the building of Nelson's Pillar, Dublin, the following description of same, taken from the Rev. G. N. Wright's work, entitled "Ireland Illustrated," may interest him and such other of your readers as are unaware of its origin: "In the year 1808, as early as arrangements could be completed (Feb. 15th), his Grace the late Duke of Richmond laid the first stone of a lofty column, raised at the public expense, to perpetuate the fame and public services of the great naval hero of the British Isles. Coins of various values were deposited in the stone, beneath a brass plate, bearing the following inscription, which is cut in capital letters:—

"By the Blessing of Almighty God.—To commemorate the transcendent heroic achievements of the Right Hon. Lord Viscount Nelson, Duke of Bronti, in Sicily, Vice-Admiral of the White Squadron of His Majesty's Fleet, who fell gloriously in the Battle off Cape Trafalgar, on the 21st day of October, 1805, when he obtained for his country a victory over the combined fleets of France and Spain, unparalleled in naval history.

"The deposition of the foundation-stone was accompanied with much ceremony and great

respect. The design, which is neither very happy nor very novel, resembles that of the Nelsonic Memorial at Yarmouth, and is by the same individual, W. Wilkins, Esq., of Cain's College, Cambridge. It is a fluted Doric column, 121 feet 3 inches in height, restin gupon a plain square pedestal, and surmounted by a colossal statue of the naval hero, 13 feet high, appropriately leaning against a man-of-war's capstan. The statue, which is a very clever, spirited production, was executed by Thomas Kirk, Esq., R.H.A. The capital is finished with an abacus, enclosed by an iron balustrade, affording a secure observatory, and commanding an extensive prospect. The shaft, which is hollow, contains a special staircase of 162 steps, leading to the platform, an elevation of 108 feet from the surface of the street. The entablature around the pedestal is inscribed with the names Trafalgar, St. Vincent, Copenhagen, Nile, and the panels beneath bear the dates of each respective victory engraven thereon.

"A sarcophagus, of a heavy-looking character, stands above the cornice, inscribed 'Nile,' having our hero's name carved upon it. The sum of £6,856, all raised by voluntary subscription, was expended in the erection of this commemorating column."

In Whitelaw and Walsh's "History of Dublin" (1818), the dimensions of the Pillar are given as follows:—

	Feet.	Inches.
The pedestal, whose diameter is 20 feet, is.....	30	1
Shaft of column, diameter 20 feet at bottom 71 8		
Capital of do. 7 0		
	78	8
Epistilion and plinth at top for the statue.....	12	6
Statue	13	0
Total height of column and statue	134	3

The materials, expenditure, and receipts are given as follows:—

22,090 cubic feet of black stone, and 7,310 do. of cut mountain granite, with stone cutters' bill, per contract	£4,876	11	3
Flagging, railing, painting, and carpenters' bill	710	15	8
	£5,587	15	8 (a)
William Kirk, Sculptor	300	0	0
Portland stone, model, scaffolding	329	2	3
Cost of statue (£629), with lamps and flag staffs	83	0	9
Total cost of pillar and statue	£6,299	18	8 (b)
Contingent expenses	556	9	7
Total expenditure (c)	£6,856	3	3
Amount of subscriptions	£6,608	16	6
Concert at Rotunda	137	9	10
Interest on money lent	499	7	3
Entrance money to ascend the column for one year, at 10d. each person, deducting cost of attendance	92	13	7
Total receipts	£7,138	7	2 (d)
Total expenditure	6,856	8	3
Balance, Cr.	£281	18	11 (e)

Laid out in stock, which, with the entrance money, is to keep the monument in repair.

The entrance to the Pillar at the present day is somewhat altered, as in the year 1894 the steps at the entrance were taken away, a doorway inserted, and new iron railings erected, the architect being Mr. G. P. Beater.—Yours truly,

A. W.

Dublin, 17th May, 1902.

(a) Should be £5,587 6s. 11d.
(b) Should be £6,299 9s. 11.
(c) Should be £6,855 19s. 6d.
(d) Should be £7,338 7s. 2d.
(e) Should be £481 18s. 11d.

THE

FIRST IRISH AERONAUT.

RICHARD CROSBIE AND HIS BALLOON.

A SUBSTITUTE'S PERILOUS ASCENT IN 1785.

(From a Contemporary Account.)

The Mr. Crosbie referred to in the following account of one of the very earliest balloon ascents, was born in the County of Wicklow in 1775, was one of the first, if not the first, native of the British islands to make a balloon ascent. [The first ascent ever made was by Pilatre de Rozier, in a balloon of Mongolfier's, at Paris, 21st November, 1783; and the first in England was by Lunardi, an Italian, in London, on the 21st September, 1784.] Crosbie was of a mechanical genius, and reading of Mongolfier's success, and having made preliminary experiments by sending up cats in cars attached to small balloons, he ascended on 19th January, 1785, from Ranelagh Gardens, near Dublin, and descended safely on the North Strand. The "Annual Register" says: "The balloon and chariot were beautifully painted, and the arms of Ireland emblazoned on them in superior elegance of taste. . . . His aerial dress consisted of a robe of oiled silk, lined with white fur, his waistcoat and breeches in one, of white satin quilted, and morocco boots, and a montero cap of leopard skin. The Duke of Leinster, Lord Charlemont, Right Hon. George Ogle, . . . attended with white staves, as regulators of the business of the day." We are not furnished with any particulars of Crosbie's life, further than that he devoted attention to aeronautics.

"The Town and County Weekly Magazine," published in Dublin by Smith of Bridge street, gave in its issue dated Saturday, 21st May, 1785, the subjoined account of an ascent in which Mr. Crosbie was to have been the aeronaut, but in which for the reasons stated below he had to find a substitute, who had rather a trying experience:—

BALLOON INTELLIGENCE.

As many contradictory reports have been circulated relative to Mr. Crosbie and Mr. M'Gwire, a Correspondent, well acquainted with all the facts previous to ascension, and informed of the subsequent ones by Mr. M'Gwire, sends us the following account, which may be depended on as authentic:—

At eight o'clock on Thursday morning, Mr. Crosbie found his balloon sufficiently inflated, and made no doubt of its being able to carry up one hundred weight of ballast. The proposed signals were made, and he waited with the greatest impatience for the arrival of his friends, but it was half past one before they assembled.

Two gentlemen were appointed to determine his power of ascension; the boat was loaded with twelve stone of ballast, in twelve bags, a grapple and rope, a fly, a speaking trumpet, a compass, a barometer and thermometer, and a basket of provisions, and a machine to measure its ascent was suspended from its bottom. Mr. Crosbie got into it, but finding it too heavy, even when the ballast had been taken out, he expressed the utmost disappointment and despair. Rather than disappoint the public, which had shown him such repeated indulgence, Mr. Crosbie determined to give up the fruit of his expense, labour, and expectations, and generously offered to let a lighter person ascend in his place. Numberless competitors crowded round the boat. But Mr. Crosbie gave the preference to Mr. M'Gwire, whom he had promised to take with him, if he took a companion. Mr. M'Gwire prepared for his ascent, one of his friends tore off his ruffle and fastened it to the valve cord to distinguish it; Mr. Crosbie gave him particular instructions relative to the use of it; ballast was thrown in, and the two gentlemen who held the boat were just going to launch it into the air, when Mr. Crosbie eagerly returned, and desired to resume his feat; he had hopes of procuring more inflammable air, and upon reflection determined rather to delay his ascent than to leave anything undone that was possible. The conflict between justice and ambition were but momentary in the mind of Mr. M'Gwire; he knew that gratitude to public, and private friendship for him, had obtained him a seat which he was going to relinquish, and with that modesty which is the companion of merit, he resigned his pretensions to Mr. Crosbie.

The balloon was again adjusted to the apparatus for inflation, and after the last drop of vitriolic had been expended, a second attempt was made by Mr. Crosbie to ascend. All the interior work of the boat was torn out, several feet of the balloon itself were cut off, all the ballast, his provision, and his last bottle of wine, were thrown overboard, and under all those disagreeable and dangerous circumstances, Mr. Crosbie undauntedly determined to ascend. The gentlemen who held the boat, pushed it upwards with all their strength, but in vain: it rose a few feet from the impulse it had received, but fell again, with no small danger to Mr. Crosbie, at the other side of the square.

In a moment another gentleman of the name of M'Gwire, jumped into the boat, and had he not been prevented by the spectators, and Mr. Crosbie, would have instantly ascended; but Mr. Richard M'Gwire's claim was too strong to be resisted; seven bags of ballast, a barometer, thermometer, a flag, a speaking-trumpet, and half a French roll, were put into the boat, and by throwing out four bags of ballast, he mounted as high as the roof

of the Barracks; perceiving his danger, with the utmost presence of mind, he gradually emptied another bag, and proceeded majestically over the park. Another higher current of the air carried him towards the sea, when upon remarking the distension which had taken place in consequence of the rarified atmosphere in which it then floated, he endeavoured to relieve it by opening the valve; he pulled the valve rope gently, and kept his eye steadily on the barometer, but perceiving that the mercury still continued to fall, he concluded the valve had not opened, and upon applying a greater force, the cord broke at the staple of the valve, presently the balloon burst just above the cord which was tied round the lower part of it. At this interesting moment, with steady composure, he marked the barometer and thermometer, and noted them in a paper, which was wafted away; but the same unruffled calmness which enabled him in so critical a juncture to commit it to paper, enabled him also to remember it. the barometer stood at 20 inches, and the thermometer at 32. This latter being the freezing point, surprised him much, as he did not perceive in his person a corresponding degree of cold, which induced him to repeat the observation three different times. His situation became more critical every instant, driving to sea with a damaged balloon, and but two bags of ballast; perceiving by the barometer that the balloon, notwithstanding the fissure, still continued to ascend (probably for the impetus not yet counteracted), he determined if it were practicable, to let more gas escape; the balloon was too high for him to reach it with his arms; fortunately he had in his pocket a small gimblet, with which he had been that morning making some alterations in the barometer, which he carried to the Barracks for Mr. Crosbie. This gimblet he tied to the flag-staff, and this latter he made fast to the speaking-trumpet, and standing on the seat he was enabled to make several punctures, in consequence of which he descended with considerable rapidity into the sea, nine miles E. N. E. of Howth.

When his boat took to the water, the impetus of the balloon brought it so near to the boat as to slack the suspending ropes, his body was thrown out, but before his legs were cleared, the balloon re-ascended so much as to make the ropes hold him fast by the ankle, his head lying in the water; being fortunately an excellent swimmer, he disengaged himself, and tried to grapple the boat, he failed in his attempt, and endeavoured to overtake it, but finding this fruitless, he thought it prudent to reserve his strength, he turned on his back, and after thirty-three minutes in this critical situation, heard the cheer of a boat's crew, "never fear, my lad, you are safe," when turning suddenly on his face, he saw them at the distance of forty yards, already holding out their hands, and straining for his relief; he then swam towards them, and was happily taken up, the boat then pursued the balloon and recovered it, and he was soon brought on shore, where their Graces the Duke and Duchess of Rutland received him with that politeness and good-nature for which they are so justly distinguished; their Graces' kind anxiety can never be forgotten by Mr. M'Gwire and his friends.

He was brought to town by Mr. Uniacke, in her Grace's carriage, and set down at Dr. Usher's house, amidst the acclamations of thousands, in perfect health, and but little fatigued.

N.B.—The barometer stood before his ascent, in the Barracks, at 30, 31 inches, and the thermometer at 63 deg. of Fahrenheit.

A MOUNTAIN LAKE.

BY THOMAS WISTAR.

Bright gem upon fair nature's breast,
Far gleaming with resplendent ray,
When morning gilds the mountain crest,
Or stars look down on dying day;

No sound disturbs thy calm repose,
No bird the hush of morning breaks;
The slumber thy fair bosom knows
Alone the fitful zephyr wakes.

Beneath the cloudless summer sky
So pure the crystal depths appear,
With heart attuned, I wish that I
Might look above with soul as clear.

Of sombre cast or joyous sheen,
If sparkling with the sapphire ray,
Or emerald, as thou now art seen,
Or clad in livery of gray,

Thou catchest from above, around,
The choicest hues of earth and sky:
The tints thy leafy borders bound
My every changing mood supply.

And thine it is such peace and rest,
Such health and happiness to give;
I would my own lot were as blest,
I would as pure and bounteous live.

The submarine torpedo boat "Fulton," during the course of her coastwise trip to the South from New York Harbour, made a successful run to the mouth of the Delaware, but, unfortunately, as she was rounding the Breakwater, there was an explosion of gas within the boat, which more or less seriously injured five of the crew. The run seems to have been fairly successful, the "Fulton" having made several dives during the night as she was passing down the Jersey coast, on one occasion remaining submerged for a distance of two miles. Probably it would be unjust to ascribe the accident to any special features of the submarine as such, since explosions due to the same cause occur in gasoline launches. At the same time it cannot be denied that the use of gasoline as a fuel becomes particularly perilous in this type of torpedo boat, where the chances of escape in the case of accident are very remote.

The fastest run ever made by a railroad train for the distance was that accomplished last month on the Burlington and Missouri River Railroad, between the two stations of Eckley and Wray, Colo. The two towns are 14.8 miles apart, and the run was made in an even nine minutes, which works out at the rate of 98.66 miles per hour. The train was made up of a small mail car, baggage car, two chair cars, three sleeping cars, a dining car, and a private car, or nine cars in all. It was drawn by a ten-wheel engine with 19-inch by 26-inch cylinders, and 72-inch drivers; the line is on a down-grade, with a maximum of 32 feet to the mile. The timing of the train was done in the observation car by five watches, one of which was held by the conductor, and the record is considered to be so accurate and well authenticated, that it has received the official confirmation of the Chicago, Burlington, and Quincy Railroad.

CANCER AND THE X RAYS.

So many irresponsible accounts of the treatment of malignant growths by the X rays have been published that it is interesting to note in the New York "Medical News" a report of cases so treated, read by Dr. William J. Morton at a recent meeting of the Harvard Medical Society of New York City, at which Dr. William B. Coley presided.

Dr. Morton's first case for discussion was that of a patient suffering from an epithelioma of the cheek, which had run a very persistent course. It was first noticed over fifteen years ago, and then, as the result of cauterization, improved somewhat. Afterwards it was treated with arsenic paste for a time, and was so much improved that it seemed to be cured. Later it broke down again, and for this last year produced great disfigurement. Before treatment with the X rays there was hardening of the tissues for three-quarters of an inch beyond the edge of the ulcer, all of which has softened as the result of about three weeks of treatment with the X rays. The case is not cured, but so much improvement has come and there is so much less discomfort that the patient is enthusiastic over the new method of treatment.

Another case was a sarcoma of the temporal bone. This had been operated upon and as much as possible of the malignant growth removed. The recurrence was treated as carefully as possible with caustics, but without any lasting effect. "Coley's Fluid" was then employed, the tumour reduced in size, and the patient's general condition much improved. Later, however, the sarcoma again returned, and the patient suffered so much that large amounts of morphine had to be used to induce sleep. After three treatments with the X rays the patient was able to sleep at night, and to cut down the usual dose of morphine to less than one-fourth. In a week the tumour was very much reduced in size, and the case is evidently progressing toward a cure.

Other cases were cited by Dr. Morton, who called special attention to the fact that the X rays produced almost immediate and complete relief from pain. In this matter they are much better than any of the ordinary analgesics; one patient, who had had considerable experience with both, said that the relief they afforded was as great as that produced by morphine, and was much more lasting. This points to the fact that the nerves of sensation of the part are entirely benumbed. The most important feature of the new growths that are amenable to treatment by the X rays is superficiality. If the growth is situated in the skin itself or if it is not covered by skin because of ulcerative processes, then the X rays are sure to be useful. Referring to one case, carcinoma of the breast, where the tumour had disappeared completely after three weeks' treatment by Dr. Morton, Dr. Coley said that he had not a single doubt as to the malignant character of the growth, and when it had recurred the third time the case had seemed hopeless.

Dr. Morton called special attention to the dangers of the use of the X ray in such cases as these, especially that from gangrene. Dr. Gibson said that the experience at St. Luke's Hospital with the X rays shows that very probably there is some great service to be expected from their use in the treatment of malignant disease, and that further opportunity for the employment of this method of treatment should be looked for so as to decide the possibilities and the limits of their application. Dr. Walker said that this method of treatment is in the hands of experts as yet, and that, while results are promising so promising as to be almost alluring, the profession must await further results at the hands of men who thoroughly understand the application of the method.

The workmen digging the foundations for the enlargement of a religious building in Turin discovered, at the depth of about six meters below the soil, a number of articles of great archaeological interest. The most important is a hollow bronze head, life size, and a masterpiece of art, in excellent preservation. The hair, the ears, and the eyes show traces of gilding. It is supposed, from comparison with other heads of the same period, to represent Tiberius. It is hoped that further research may lead to the discovery of other parts of the statue.

LITERARY NOTES.

The "Berliner Tageblatt" announces the death of Herr Julius Grosse, the well-known poet, while staying at Lake Garde. Julius Waldemar Grosse was born at Erfurt, Prussia, April 25, 1828. He was a journalist at Munich from 1854 to 1870, when he became secretary of the Schiller Stiftung at Weimar. Since 1862 he published many poetical and dramatic works and novels.

✧ ✧ ✧

There appears to be indications of a Carlyle boom this year. Messrs. Chapman and Hall have a new edition, to be called the "Edinburgh Edition," in preparation, which is to be printed on India paper and to be completed in fourteen volumes. There are rumours, also, of other issues. It is obvious that Carlyle still sells largely, for Messrs Chapman and Hall, during the past three years, have sold on an average thirty thousand copies of his works a year. But is he so largely read? We suspect, remarks the "Academy," he is amongst the "presentation authors" who occupy a good deal of shelf room. Yet the appeal of "Sartor Resartus" and "Heroes and Hero Worship" can hardly, to the young at least, ever fail.

✧ ✧ ✧

The Booklover's Library, which claims to be the largest circulating library in the world, was founded in Philadelphia no longer ago than March, 1900. It has fifty branch libraries, and delivers books in nearly all towns in the States having a population of a thousand or over. The membership is limited to a certain number in each locality, and the corporation guarantees to "deliver new books in the best bindings, always clean and pleasing to handle." The latest development of this remarkable institution is called the "Tabard Inn" service, and consists in placing revolving bookcases, the contents of which are frequently changed, in drug stores and shops. We feel, says the "Academy," commenting on this piece of enterprise, that there are some developments of literary enterprise from which this country is happily free.

✧ ✧ ✧

The Anglo-Russian Literary Society has printed quite a bulky volume of its proceedings during February, March, and April. The Society, which meets at the Imperial Institute, appears to be doing a good deal to promote a better understanding between Russians and Englishmen. During the three months which the "Proceedings" cover, papers were read by both Russians and Britons, on such varied subjects as "Maikov" (Russian poet), "Two Anglo-Russian Philanthropists" (John and Walter Venning), "Russia and the Russians," "Godol's Celebration," "How to Improve Anglo-Russian Relations," and "Russian Waterways." The "Proceedings" contain also a number of translations from Russian poets. Among forthcoming papers is "A Journalist's Scamper through Siberia and Manchuria," by J. Foster Fraser, to be read on June 1.

✧ ✧ ✧

Apropos of an article on "The Coming Novelist" in the "Daily Mail" by Mr. Justin M'Carthy, Mr. G. K. Chesterton writes in the current "Pall Mall Magazine" concerning the over-production of novels. Mr. Chesterton is optimistic; he holds that the critics are not really afraid of literary degeneration—they are frightened by mere numbers. "It is not," he says, "because the novels are weak, but because we are weak, that we seek to arrest this impetuous progression." And he proceeds to assert that people write and read novels because they have discovered that life is fundamentally romantic. This, no doubt, the "Academy" remarks, is one very good reason, though it is no new discovery. But Mr. Chesterton hardly touches that very large class of novels which would almost appear to be written for the purpose of misrepresenting life. Now true romance never misrepresents.

✧ ✧ ✧

M. Xavier de Montepin, the eminent French novelist, who died lately, had, like most of his craft, experienced hard times at the beginning of his eventually very successful career. To one experience he always referred with particular zest. On concluding a long and elaborate tale of adventure, he took it full of hope to a publisher, who promptly declined it on even the most advantageous terms, to the writer's poignant mortification. Twenty years afterwards this identical publisher besought at his hands a sensational story—one of those serials which were the delight of grisettes—offering any price within reason. "Well," said Montepin, "I will oblige you, but my terms must be somewhat heavy; I want £4,000." After many protests it was paid. In telling the story de Montepin added: "The best of the business was that it was the very same story which he had previously rejected, and which I had in various directions endeavoured to dispose of."

✧ ✧ ✧

In the "Cornhill Magazine" for May Mr. Charles Whibley tells over again the now almost forgotten story of the literary forgeries of Vram Lucas, which imposed for so long upon the credulity of the amiable M. Chasles, a distinguished member of the French Academie, and even duped the Academie itself. In the course of a few years Vrain Lucas sold to M. Chasles 27,472 forgeries for the comfortable price of 150,000 francs. To give the names of the correspondents would be to exhaust the roll of fame. They belonged to all countries and all ages. The letters of Sappho, Thales, Virgil, Julius Caesar, Zeno, St. Luke, Lazarus, Montaigne, Rabelais, the Cid, Moliere, Newton, Galileo, Pascol, Louis XIV., and countless others jostled each other in the ample chests of M. le Comte de Boisjourdain. This was the gentleman who, according to Lucas' story, had rescued the collection at the Revolution from the famous Cabinet of the Chevalier Blondeau de Charnage.

✧ ✧ ✧

The question as to whether Mr. John Bright, who was in his day the prince of Parliamentary orators, used to prepare his speeches by writing them out beforehand or otherwise, is finally set at rest by a letter which Mr. H. W. Lucy publishes in his "From Behind the Speaker's Chair" in the "Strand Magazine" for May. The letter is from Mr. John Albert Bright, the great "Tribune's" eldest son, and is as follows:—

Dear Mr. Lucy—I see in an article in the "Strand Magazine" you say that my father used always to write out his speeches and commit them to memory. You are quite mistaken in that. I have seen him prepare his speeches scores of times, and he never wrote them out. In a letter published in the volume of his public letters, and written in 1874, he says—"I have never been in the habit of writing out my speeches—certainly not for more than thirty years past. The labour of writing is bad enough, and the labour of committing to memory would be intolerable. . . . It is enough to think over what is to be said, and to form an outline in a few brief notes."

✧ ✧ ✧

"£4,000 for a Bible!" This was the price paid not very long ago in a London auction room for a copy of the Bible. The fact of so high a value being placed upon a single copy has led Mr. J. Cuthbert Hadden, an industrious literary investigator, to tell the story of the "£4,000 Bible and others" in the May number of the "Gentleman's Magazine." The Bible in question is what is known as the Mazarin Bible, because of the discovery of a copy in the library of Cardinal Mazarin; but it is more properly called the Gutenberg Bible, coming, as it did, from the press of the inventor of the art of printing from movable types. The date is supposed to have been prior to 1456. It is a folio of 641 pages, printed in black letter, double columns, without title-page or pagination. Various prices previously paid for the Mazarin Bible were—A vellum copy in 1825, £504; and a paper copy, £199 10s. The former sold for £3,400 in 1873, and the paper copy for £2,690. The purchaser of the former was the Earl of Ashburnham, and when his library was sold in 1897 the Bible brought £4,000. In 1884 Mr. Quaritch also paid £3,850 for a copy.

✧ ✧ ✧

The current "Century" publishes "A Little Essay on Books and Reading," by Mr. Dooley. Here is one of his deliverances:—

Hardly a day passes but some lady fri'nd iv mine stops me on me way to catch a car, an' asks me if I don't regard Morse Hewlett as th' gr-reatest an' mos' homicidal writer iv our time, an' what I've got to say about Hinnelly's attack on Stevenson. "Madam," says I, "I w'u'd n't know Morse if I was to see him goin' down th' sthreet ax in hand, an' as f'r Hinnelly, his name escapes me, though his language is familiar to anny wan who iver helped load a scow. Stevenson," I says, "does n't appeal to me, an' if he sh'u'd I'll revarse th' decision on th' ground iv th' bad prevyous charackter iv th' plaintiff, while," I says, "admittin' th' thruth iv what he said. But," says I, "th' on'y books in me libr'y is th' Bible an' Shakespere," says I. "They're gr-reat f'r ye," says she. "'So bully f'r th' style. D' ye read them all th' time?" she says. "I niver read thim," says I. "I use thim f'r purposes iv definse. I have niver read thim, but I'll niver read annything else till I have read thim," I says.

The "Essay" is illustrated, and has clever realisations of Mr. Dooley and Mr. Hennessy.

✧ ✧ ✧

Lord Crewe justified a literary name in the chair at Mr. Herbert Paul's lecture on "Style," delivered at the Speaker's house recently in aid of Mr. Watts Hughes's home for boys at Barnsbury. The rustle of evening cloaks as the beautiful room filled almost made one scent a hidden joke in the subject of the lecture, but Mr. Paul kept his gravity even when he assumed that we all knew Sir Thomas Browne and John Dunne as well as Louis Stevenson. We were all (remarks a correspondent) "Macaulay's schoolboys." He came to courageously close quarters, too, with his subject in giving us four masters of style among poets, and four among prose writers ("you can draw no real distinction between style in poetry and style in prose"), and in sifting them for common qualities. It may be interesting to give the names which Mr. Paul defensively qualified as names which no list could leave out. In poetry Sophocles ("the chiselled perfection of human thought"), Virgil, Dante, Milton; in prose Plato ("the greatest master of style who ever lived"), Tacitus, Bacon ("one of the least Shakesperian of writers"), and Pascal. And their common qualities he put down as dignity, lucidity, and strength. It is perhaps particularly unfair to a lecturer on "Style" to pick out "good things," but Mr. Paul tempts one. Swift, "the perfect prose of plain common sense;" Shakespeare, "who exists to show that rules have only a limited application"; "Unto this last," which Mr. Ruskin supposed to be a refutation of what he took to be political economy; "Our language I believe to be even a finer language than the French, but we don't care so much about it." Louis Stevenson, "who after all was a man of genius." These are a few of Mr. Paul's own touches; and in broader vein were the stories of Flaubert, who passed a sleepless night because of a double genitive in "Madame Bovary," and the victim of examination which paraphrased "Canst thou not minister to a mind diseased?" into "Can you wait upon a lunatic?"

SCIENTIFIC TOPICS.

Lamp-black, which for hundreds and hundreds of years has been the chief ingredient in dark pigments, may perhaps be eventually displaced by acetylene-black. The chief merit of the new substance lies in its freedom from grease and, therefore, in its more ready manipulation. It is said that acetylene-black is admirably adapted for the uses of the manufacturer of printing inks. The high cost of acetylene-black is the only obstacle that bars its general introduction. A field is, therefore, opened to inventors in devising a method of producing the substance cheaply in large quantities. At present the black pigment is obtained by decomposing acetylene through the medium of an electric spark.

✧ ✧ ✧

Among the most interesting of the exhibits at the Royal Society's soiree were the manuscripts of the late Professor J. Couch Adams, relating to the discovery of Neptune. Adams determined in 1841, while still an undergraduate in his second year, to attack the problem, and in 1846 the planet was discovered. The earliest, though necessarily the least perfect of the papers, is perhaps the most interesting. In it the orbit and mass of the unknown planet that was disturbing Uranus are calculated, and the final result set down in Adams's handwriting at the end of September, 1843, "three years before the planet was observed with the telescope," and two years before Leverrier had taken the matter in hand. Adams died in 1892

✧ ✧ ✧

The House Committee on Coinage, Weights, and Measures, which is now considering the advisability of adopting the metric system in the various departments of the United States Government, had two distinguished witnesses before it recently in the persons of Lord Kelvin and George P. Westinghouse. Lord Kelvin advocated the passage of the Bill warmly. He remarked that he had long hoped that England would take the lead in this matter. If the United States were the first to adopt the system, he had no doubt that England would soon follow suit. He was glad to see that the Committee intended to allow a suitable time for the adoption of the standard before making it effective in order that the public at large might familiarise itself wth metro terminology. Mr. Westinghouse also advocated this system.

✧ ✧ ✧

In the valley of Camonica, in northern Italy, electric furnaces have been erected for the purpose of manufaoturing pig iron under the Stassano patent. There are three furnaces, taking 500 horse power each, in each of which furnaces electrodes are employed, placed in the lower part. The ore is pulverised before being put in the furnaces, and a sample carefully inspected and analysed with the object of ascertaining how much carbon will be necessary to reduce it successfully, likewise the required quantity of fluxes. After a determination of the lime, carbon and silicate, the proper proportions are added to the pulverised ore, and briquettes are formed, to which are added from 5 per cent. to 10 per cent. of coal tar. The furnace heat developed around the electric arc decomposes the iron ore, the oxygen with the carbon uniting to form carbon-dioxide. The figures given show that 3,000 horse power hours of the current, costing 13s. 9d., are required to make one metric ton of iron.

✧ ✧ ✧

The extraordinary dust fall in Europe a year ago (March 9-12, 1901) has been studied by Hellman and Meinardus, whose memoir has lately appeared in the Abhandlungen of the Royal Prussian Meteorological Institute It is shown beyond dispute that the dust came from the Sahara, and not from South America, as the famous Ehrenberg concluded for similar dust-falls many years ago. Dust storms were observed in the Algerian Sahara during the days immediately preceding the dust fall in Europe. South of the Alps there was a stormy sirocco; further north, the lower air was relatively quiet, but the higher currents were strong from the south, their velocity of 70 kilometers an hour agreeing with the rate at which the dusty area was extended northward. The microscopic analysis of the dust showed it to be a mineral composition such as the Sahara would furnish. Around the Mediterranean the dust fell during the dry sirocco, but further north, especially in northern Germany, the dust came down with rain and snow. Most of it fell south of the Alps. Further north the size and the specific gravity of the particles were reduced. The average weight of a grain of quartz dust in northern Germany was 1-3,200,000,000 gramme. The total fall is estimated to have weighed 2,000,000 tons.

✧ ✧ ✧

An interesting lecture was recently delivered before the Society of Arts in London by Mr. William Jago upon "Chemistry of Confectionery." In flour confections or cakes—not sugar confections or sweets proper—the principal substances used are flour, milk, eggs, and sugar. For confectionery the weaker and softer flours, containing much starch and little gluten, are preferable. Milk is used as a moistener instead of water, because of its richness, average pure new milk containing 4.0 per cent. of fat, 3.6 per cent. proteids, 4.5 per cent sugar, 0.7 per cent. ash, 8.8 per cent. non-fatty solids, and 78.4 per cent of water. It is not only the fat in the milk that is of service to the confectioner, but also its proteids, which, though like the white of eggs have no very pronounced taste, yet confer a fullness of flavour which a simple solution of lactose in water would not possess. In baked goods the proteids of milk produce a moistness and mellowness of character, and new milk, therefore, gives to confectionery richness to its fat, sweetness through its sugar, and mellowness through its proteid.

✧ ✧ ✧

Next to milk, eggs are one of the most important moistening agents to the confectioner. In composition the white of eggs consists of proteids dissolved in water, while the yolk contains in addition to the proteid, fat and colouring matter. The white of eggs may be viewed as a solution of one part albumen in seven parts of water, while in the whole egg about two-fifths of the solids consist of fat and three-fifths of proteid, while the water of the whole egg amounts roughly to three-quarters of its weight. Another moistening agent used by confectioners is glycerine. If exposed to the air glycerine increases in volume through absorption of moisture. Chemically glycerine is a compound of carbon, hydrogen, and oxygen, belonging to the alcohol type. When used in small quantities in cakes the result is that drying is much retarded, and the cake remains fresh and moist for a considerable time longer than would otherwise be the case. Many aerating agents are used by confectioners, the chief of them being ammonium-carbonate, usually called "ammonia," or volatile sodium bicarbonate, tartaric acid, and cream of tartar. The chemical action of these on the confectioner's paste is to change the sugar present by fermentation into alcohol and carbon-dioxide gas, which has the mechanical effect of distending and lightening the dough.

✧ ✧ ✧

The advantages of the twin-screw system of propulsion of steamships have been proved once more in the case of a disabled Atlantic steamship. In this case it was the Deutschland, the fastest of the Transatlantic liners, that got into trouble, her rudder having been carried away at a point 400 miles west of Bishop's Rock. To a single-screw ship this disaster would have meant complete disablement; for although smaller vessels have been steered by jury rudders consisting of floating spars towed astern of the vessel, no such makeshift device could be rigged up that would control a 23,000-ton liner. As it was, however, by means of signals sent down from the bridge to the engine room it was possible to keep the great vessel on a true course, the port or starboard engine being given more or less steam to counteract the veering of the vessel as she sheered to port or starboard. It is conceivable that in ordinary weather a twin-screw ship would experience but little delay from an accident which, happening to a big liner of a dozen or fifteen years ago, would have rendered her completely helpless.

✧ ✧ ✧

The United States Weather Bureau has long been experimenting with suitable instruments for the transmission of wireless telegraphic messages. Recent experiments made by Prof. Willis B. Moore, the superintendent of the Weather Bureau, have demonstrated the feasibility of the new apparatus which the Department of Agriculture will probably adopt. Prof. Moore stated that over water of wide expanse wireless messages could be sent accurately and quickly, and more rapidly than if wires were used, but that it was a matter of some doubt whether aerial communication would prove very successful on land. The Department used a new wireless receiver, in which a telephone is employed. The recent experiments showed that this apparatus operates faultlessly and rapidly. Prof. Moore states that he sent a message which, to be transmitted over a wire by electric telegraph, would require two or three minutes, and which was sent without wires at about the fastest rate of wire telegraphy over a land wire. What the particular construction of the Department's wireless telegraphic apparatus may be has not as yet been disclosed.

✧ ✧ ✧

The members of the Babylonian expedition sent out by the German Oriental Society, have, in spite of the heat, wind, and dust, held out steadfastly at their post, and have brought to light many valuable memorials which, with those already unearthed, will some day give a faithful picture of the ancient metropolis, its streets, temples, and palaces, and its social, intellectual, and religious life. Up to now four hundred inscribed clay slabs have been found in the centre of the ruins of Babylon. Of only two of them are the inscriptions yet deciphered, but they are pearls of Babylonian literature. One tablet contains a great part of a celebrated Babylonian compendium, which explains the Babylonian cuneiform characters. It is a very ancient dictionary, of great linguistic interest, and of exceptional value practically. The second tablet contains no less than the litany which was chanted by the singers of the Temple of Esagila on the return of the god Marduk to his sanctuary. Marduk, or Merodach, was the son of Ea, and one of the twelve great gods of the Assyro-Babylonian Pantheon. His temple, Esagila, "the exalted house," became the national sanctuary of the whole empire. He had also a sanctuary at Sippar. He is twice mentioned in the Book of Jeremiah, and in Isaiah, as Bel. It was the custom to sing the litany which has now been found after the periodical procession to that grand pantheon which has been brought to light by the expedition, and which, it is hoped, by the winter will be completely excavated. In the meantime Herren Koldewey and Andrae have made another important discovery, a temple of Ador, or Nineb, the tutelar god of physicians, hitherto quite unknown. The German Odiental Society's account of these discoveries, which has just been published, also gives a minute description of an amulet, supposed to protect the wearer from the machinations of the demon Labartu. Labartu was an ashen hued being who made people pale with terror, drank human blood, caused great sorrow, and was acompanied by a black dog. This amulet was once hung round a child's neck in order to drive off the demon.

GLIMPSES OF THE PAST.

From the Dublin Newspapers of 1793.

NOVEMBER 7.—Last Monday exhibited a spectacle in this city pleasing to every friend of virtue and humanity. A procession, formed of all the several parochial charity schools in the metropolis, conducted by their schoolmasters and mistresses, to and from St. Werburgh's Church, where an examination of the progress made by each in the principles of the Christian religion was held by the Rev. George Miller, A.M., F.T.C.D., before the Association for Discountenancing Vice, and promoting the practice of Virtue and Religion, by whom silver medals, with emblematic devices, Bibles, etc., were given as premiums to the best answerers.

The Association, we understand, intend holding such an examination annually in future, and also publishing the names of the successful children, as well as those of their respective masters, as the best means to excite emulation in both.

It is worthy to be mentioned that several most respectable members of the Association joined in the procession, walking two by two before the children; nor can any but those who were present at St. Werburgh's Church during Divine Service, conceive the sublimity of near five hundred youthful voices, raised in Hallelujahs to their Creator, expressive at once of gratitude and adoration.

NOVEMBER 9.—The Privy Council sat in Dublin Castle for the purpose of taking into consideration advices received from Philadelphia, that an epidemical fever raged there, which made dreadful ravages; in consequence of which we hear a quarantine is laid upon all vessels entering any of the ports of this kingdom from America. This pestilential malady is said to have been communicated at Philadelphia from a vessel arrived there from the island of Grenada.

NOVEMBER 13.—Monday last the Attorney-General moved the Court of King's Bench on the part of the King against Archibald Hamilton Rowan, Esq., for liberty to amend the information filed in the said cause in last Trinity term, by striking out of the engrossment the following words, that is to say—"meaning a proclamation issued under the great seal of the kingdom of Ireland, the 8th day of December, 1792, for repressing all seditious associations."

The Recorder, on the part of the defendant, made no objection to the motion being granted.

The Court ruled that the prosecutor be at liberty to amend the information as is desired.

The same day the Attorney-General moved the Court of King's Bench in the same cause, that the issue in this cause be tried at the bar of this court on the first Wednesday after the first sitting-day in the next term.

Yesterday, in the Court of King's Bench, in the case of the King, at the prosecution of the Duke of Leinster, against John Giffard, Esq., one of the present High Sheriffs of the city of Dublin, for a libel against his Grace, the court allowed the cause shown, and set aside the conditional rule.

DECEMBER 1.

Saturday last, in the Court of King's Bench, the Attorney-General moved the Court that a writ of habeas corpus might issue for bringing up John Fay from the goal of Trim, where he was committed some days ago on some charges of a capital nature. The Court granted the motion.

The Recorder, as counsel for Mr. Fay, moved the Court that the information against him be returned to the Clerk of the Crown, which was granted; and

Yesterday Mr. Fay, of the county Meath, arested on a charge of being accessory to the murder of the late Rev. Mr. Butler, and an abettor of defenders, was brought up here from Trim goal, escorted by a party of the English Light Dragoons, and lodged in the New Prison.

Mr. Fay is said to a dealer in flour, and worth a property of £30,000.

Yesterday, about two o'clock, a very serious occurrence took place on the north side of the river, a little above the new Custom House. The crew of a boat belonging to a tender in the Bay, under command of a lieutenant and a midshipman were proceeding with some fresh provisions for their ship's use, when perceiving, as they thought, a very favourable opportunity to impress some of the crews of vessels in that quarter, orders were given to board them. The consequences were such as might have been expected at such a period as the rash adventure was undertaken. The sailors belonging to the trading ships rose against, and by their numbers overpowered them; handpikes, and every instrument which presented itself, were used with dreadful effect on the agents in this injudicious business: the officers were precipitated from a vessel, they had entered into the boat, and being brought to the south side of the river, were there assailed by the sailors and coalporters, who cut and contused them in so cruel a manner, that their lives are in the most imminent danger. Several of the press-gang are desperately wounded. The beef which was conveying to the Bay being brought on shore, was hacked to pieces by a number of poissards, who hurried home with the spoils of this victory.

Detachments of horse and foot, headed by the Sheriffs, proceeded to the scene of affray as soon as information was received of the transaction, but arrived too late to obviate the consequences of what in the first instance seems to have been an act of temerity.

On Saturday last Mr. W. H. Thorpe's poem: "Ancient Rome considered in its rise, zenith, declension, as contrasted with its modern appearance," obtained in our University a premium for English verse composition.

Yesterday John M'Dermot, who stands charged upon a capital offence, alleged to have been committed in the county of Roscommon, and who has been removed here from the gaol of that county, was brought up to the Court of King's Bench, on the motion of the Attorney-General, in order that a day should be appointed for his trial; and the Court ruled that he should be tried at the bar on the 8th of February next.

Friday the election of a member for the county Down, in the room of the Earl of Hillsborough, now Marquis of Downshire, was held at Downpatrick, when Mr. Savage was unanimously chosen.

His Excellency the Lord Lieutenant hae been pleased to appoint Mr. Barrington to be one of his Majesty's counsel at law and also to the office of clerk of the ship entries, lately held by Mr. George Ponsonby and Mr. Coppinger.

The ticket, No. 32,882, drawn this day a prize of £5,000, was sold in shares, by Mr. Wm. Jones, Dame street.

DECEMBER 6.

On Saturday last a number of letters were received in town from Bordeaux, of various dates up to the 9th of last month, at which time the foreigners, subjects to the States at war with France, were still in confinement, pursuant to the decree of the National Convention, to the number of three hundred persons; but as a modification of this rigorous measure has just taken place in Paris, they all expected to be liberated in a very few days.

Of the above prisoners, one hundred and thirty-four are British; these have the ci-devant Carmelite Convent for their prison, where they are treated with all the lenity and accommodation their condition can admit of, having an unrestrained communication with each other, and the free use of large and beautiful gardens to walk in, with liberty to write letters, etc., to their friends either in France or foreign countries.

On the 6th ult., one of the conventional commissioners paid them a visit, and said he was directed to assure them that it was with the utmost reluctance the Convention had, through the direful necessity of circumstances, been induced to take so violent a step against persons whose good opinion they wished to cultivate; but, added the commissioner, none of you can be ignorant that a dreadful conspiracy was lately on foot to set up the standard of counter revolution in Bordeaux, as well as at Lyons and Toulon, by the means of foreign gold and domestic traitors; these last wretches are well known, and will shortly all meet the fate they deserve; against you we find no cause of accusation, and in consequence thereof, you shall in a few days be restored to liberty and the peaceful enjoyment of your property and business, under the protection of the Republic, while you demean yourselves as you have hitherto done.

THE MARKET PLACE, ATHLONE.

FROM A PICTURE IN THE DUBLIN PENNY JOURNAL, 1834-5.

HISTORY OF ATHLONE.

(rom Lewis's "Topographical Dictionary of Ireland," 1837.)

Athlone, a borough, market and post-vn, and an important military station, rtly in the barony of Brawney, county Westmeath, and province of Leinster, d partly in the barony of Athlone, nty of Roscommon, and province of naught, 12 miles (N.E. by E.) from llinasloe, 15¼ (S.E. by S.) from Ros-mon, and 59½ (W.) from Dublin; con-ning 11,406 inhabitants. This place ives its name from the words "Ath ain," signifying in the Irish language e ford of the moon," of which, pre-isly to the introduction of Christianity, ancient inhabitants were worshippers; according to some, from "Ath-Luan," in reference to the rapids at the bridge over the Shannon. After the erection of a town at this ford it obtained the name of "Bail-ath-Luain," or "town of the ford of the moon," by which, now contracted into "Blahluin," it is generally called by the Irish inhabitants of the neighbourhood. The town is situated on the river Shannon, by which it is divided into two parts, and on the great western road from Dublin to Galway through Ballinasloe. An abbey for Cistersian monks, dedicated to St. Peter, was founded, according to Ware, in 1216, on the western or Connaught side of the Shannon, to which in that year King John gave certain lands in exchange for the site on which was erected the Castle of Athlone, besides one-tenth part of the expenses of the castle, which afterwards become one of the principal military stations in the country. The castle was progressively increased in strength, and so important was it regarded by the English monarchs, that when Hen. III. granted the dominion of Ireland to his son Prince Edward, this town was expressly reserved with other principal cities; and when the same monarch granted the whole of Connaught to Richard de Burgo, he retained for himself five cantreds contiguous to the castle. In this reign another monastery was founded on the eastern side of the Shannon, by Cathal Croibh-Dearg O'Connor, Prince of Connaught, and completed by Sir Henry Dillon, who was interred in it in 1244. In the reign of Elizabeth this place was greatly improved, the fortifications were strengthened, and the castle was for some time occupied by the Earl of Essex. The castle became the seat of the presidency of Connaught, and when the insurrection

broke out in 1641, it was occupied by Viscount Ranelagh, then lord-president, with the usual ward of a royal castle. Independently of its several defences, the town was strong in itself, being built of stone; and the inhabitants having given assurances of their determination to defend it against all enemies, the president entrusted it entirely to their custody; but in a few weeks they secretly formed a design of enabling the insurgents to seize the president and his family, and to surprise the castle. For this purpose they admitted Sir James Dillon's forces within the walls on the night of Saturday, in the hope of surprising Lord Ranelagh on his way to church in the English town on the following day; but by some mistake in the appointed signal, the design miscarried. The Irish forces laid close siege to the castle for twenty-two weeks, when it was relieved by some troops sent from Dublin by the Duke of Ormonde, who strengthened the garrison; but with this reinforcement the president effected nothing more than an unimportant defeat of the Connaught men near Ballintobber. During the president's absence on this expedition, the insurgents of Westmeath under Sir James Dillon attacked the English town in such numbers that the garrison were compelled to abandon the walls, but they defended the houses till Captain St. George, making a sally from the castle, compelled the assailants to withdraw. By occupying the pass of Ballykeran, however, Dillon's forces cut off all communication from the metropolis, and reduced the town to a state of extreme distress for want of supplies, which an entire troop had to cut its way through his forces to Dublin to solicit. At length, all hope of assistance being extinct, the president negotiated with the enemy for a safe conduct for his wife and family to Trim, which was honourably granted; and so forcibly did Lady Ranelagh, at Dublin, urge the necessities of the deserted English in this town, that a convoy was sent to bring the inhabitants away. This convoy, which consisted of 1,100 foot and a few horse, summoned from the garrisons around Dublin, under the command of Sir Richard Grenville, arrived at Athlone in the latter part of February, 1642, and found the English there so much reduced in numbers as scarcely to muster more than 450 men, and many of these so wasted by famine and disease as to be unable to march. They fought their way home through the pass of Rochonnell, and the custody of the castle was assumed by Viscount Dillon of Costelloe. After the victories obtained by Cromwell, the castle was taken on a second attack by Sir Charles Coote for the parliament; and during the fury of the war the town was burned; though restored, it never recovered its former strength or appearance; and in the reign of Charles II. the eastern portion of it was destroyed by an accidental fire.

During the war of the Revolution, the town was held for James II. by Col. Richard Grace, an experienced officer, and a garrison, consisting of three regiments of foot, with nine troops of dragoons and two troops of horse in and around it. Immediately after the battle of the Boyne, Lieutenant-General Douglas was sent by William III. to assault the town. Colonel Grace, doubtful of his ability to defend the whole, burnt the eastern portion of it, and breaking down some of the arches of the bridge, fortified himself in the other part; and Douglas, after battering the castle for eight days without success, withdrew his forces in the middle of the night. Towards the midsummer of 1691, the main

SEAL.

body of William's army was led to the assault by De Ginkell, who first made himself master of the eastern portion of the town, of which, after the retreat of Douglas, the Irish had taken possession, and had fortified it with additional works. From the 20th till the 30th of June, a destructive canonade was kept up across the river by both parties from batteries successively erected; during this period, after expending 12,000 cannon balls, many tons of stone shot, 600 shells, and more than 50 tons of powder, De Ginkell destroyed not only the castle but every house on the Roscommon side of the river. New works were constantly, however, thrown up by the garrison, assisted by the Irish army under St. Ruth, which had encamped at a short distance for the especial defence of the bridge, the passage of which was perseveringly contested with frequent destructive losses to William's army. On the last day of the siege a council of war was held, when it was resolved to storm the town, and the ringing of the bells of St. Mary's church was appointed as a signal for crossing the river. This was accordingly effected the same evening by the army in three divisions, and such was the simultaneous velocity of their movements, that after an hour's sanguinary conflict the assailants became masters of the town, which was immediately evacuated by the garrison. A detachment, which had been sent by St. Ruth to oppose them, was repulsed by the victorious army, who turned the guns of the garrison against them; and St. Ruth, on their taking possession of the place, decamped with his forces to Aughrim, fifteen miles distant. During this siege the loss of the defenders amounted to 1,200; and their brave commander, Col. Grace, who had been chamberlain to James II., while Duke of York, and one of his most faithful adherents, was killed in the action. The English, on taking possession of the town, immediately directed their attention to its restoration and to the repair of its fortifications and works; and it soon became one of the principal military depots for arms, stores, and ammunition. On the 27th of October, 1697, the castle was, during one of the severest storms ever known here, struck by the electric fluid, which set fire to the magazine, in which were 260 barrels of gunpowder, 10,000 hand grenades charged, and a great quantity of match and other combustible stores, the whole of which exploded with so violent a concussion that all the houses in the town, except a few cottages without the gates, were shattered or destroyed: the loss of life, however, was comparatively small, only 7 persons being killed and 36 wounded.

The town, though at present the largest on the Shannon next to Limerick, still retains much of its character as a military station. On the Leinster side, one of the principal entrances near the river is through a gateway in one of the old square towers; and the ancient walls, though in a great measure concealed by buildings, extend for a considerable distance in that direction. On the Connaught side there are scarcely any traces of the walls or gates; but in this quarter are situated all the present military defences of the place.

The town was incorporated by charter dated Dec. 16th, 4th of James I. (1606), which was seized by Jas. II. on a judgment of forfeiture obtained in the court of exchequer, and a new charter was granted in the 3rd of that monarch's reign; but the judgment being subsequently declared void, the former has since been and still is the governing charter, and the latter has not been acted upon since the accession of Wm. III. Other charters confirming and extending the privileges of the corporation were granted on the 16th of Jas. I. and 17th of Chas. II.; and the "New Rules" made by the lord-lieutenant and privy council, in the 25th of Chas. II., provided that the appointment of the sovereign, recorder, and town-clerk should be subject to their approval. The style of the corporation is "The Sovereign, Bailiffs, Burgesses, and Freemen of the Town of Athlone;" and the officers are a sovereign, two bailiffs, thirteen burgesses (including the constable of the castle, Viscount Castlemaine), a recorder, town-clerk, serjeant-at-mace, and billet-master; and there is a select body called the common council. The borough sent two representatives to the Irish parliament prior to the Union, since which period it has sent one to the imperial parliament.

Out of the 4,200 species of plants gathered and used for commercial purposes in Europe, 420 have a perfume that is pleasing and enter largely into the manufacture of scents, soaps, and sachets. There are more species of white flowers gathered than any other colour—1,124. Of these 187 have an agreeable scent, an extraordinarily large proportion. Next in order come yellow blossoms, with 951, 77 of them being perfumed. Red flowers number 823, of which 84 are scented. The blue flowers are of 594 varieties, 34 of which are perfumed, and the violet blossoms number 308, 13 of which are pleasantly odoriferous.

THE INDIAN CADMUS.

In the beginning of the last century, when the herokee Indians still lived down in Georgia, ne of them completed as extraordinary an inven on as many which have given their originators eathless fame and ample fortune.

One day members of his tribe took a white ıan prisoner, and found in his pocket a scrap of aper with printed words upon it. The prisoner cplained its meaning to the wondering redmen, ho at once called it "the paper that speaks." here were some, however, who were sceptical, nd refused to believe the white man, while others eceived the message on the paper as the work f the Great Spirit. One only among them, by ame Sequoyah, comprehended the situation.

"We forget things," he said, "because we have o way of making paper speak. We should have way. I will find it."

The captive explained that letters stood for ounds, groups of letters for words or ideas. And equoyah said:

"My nation, too, shall have what you call an lphabet."

He worked for twelve years, the laughing-ock of his tribe, using birch bark instead of aper, always hopeful, always believing, until at ng last success came. He was a white-haired ıan of sixty when his task was done, but he had ot lived in vain; he had placed himself in the ınk of great inventors, and given a priceless oon to his people.

There are those who declare that Sequoyah's lphabet is better than the one from which he ained his inspiration. It is so simple and so ell adapted to the language for which it is ritten that young Indians easily master it in few weeks. When it was a novelty they looked pon it as some wonderful toy, and neglected all eir sports and occupations while they went to ork to learn how to write down words that ould fix their thoughts, as flies are imprisoned ı amber. Many of them took unaccustomed ourneys for the express purpose of writing to eir homes. Even old men nearing the grave eemed to grow young again in this strange and ascinating study.

Sequoyah's alphabet contained thirty-six let-ers, each one representing a sound, and having ıe value of a syllable. The inventor, unlike ıany others, received honours and appreciation uring his lifetime, being proclaimed Philosopher nd Prophet by the Great Council, and receiving medal, which he wore to the day of his death.

One would have thought a single achievement f this sort enough for one individual; but not ontent, he devised a scheme whereby all Indian ngues might be consolidated into one. To gain ıe knowledge of other languages which he would equire for his new undertaking, he set forth on long journey, and from this journey he never eturned. He was received everywhere with omage and honour, but the fatigue of the trip nquered him, and he died in New Mexico, work-ıg to the last.

More than half of the Cherokees are now speak-ıg English; so it is likely that their language, ne of the best used by Indians, will soon be ntirely superseded by that of their conquerors. nd when this takes place there will be no more se for the invention of the good Sequoyah.

THE MOUNTAINS.

owed unto silence and impassiveness;
Mute and immovable, by God's decree,
Through ages past, through ages yet to be,
ehold, how potent is their spell to bless!

holy quietude this rock and soil
Have communed with high heaven, and so attained
Wisdom humanity hath not yet gained
Vith yearning, heartbreak, and tumultuous toil.

angeless! Yet changed with ever-varying shades;
This crag, or that, enshrouded from our sight,
Then tow'ring forth, snow-crowned and bathed in light,
ve where soft mists 'broider deep purple glades.

riceless! Yet hark, how many a perfect song
Hath in the hills its inspiration found;
Yea, sweeter harmonies of thought and sound
ıan man can utter unto these belong.

auty and song are theirs, and peace divine,
While heaven bends low to meet them where they wait,
Patient, receptive; friends, not thralls, o' Fate.
rn to the hills, O restless heart of mine!

"GAELIC SUPERSTITION."

By GILLA GAEL.

I.

In writing of such a subject as the above I take it to mean a foolish or absurd belief in omens, prognostics, charms, spells, supernatural agencies, and the existence of such as Fairies, the Good People.

Gaelic superstition has been a very over-written subject. Writers have familiarised us with its ad nauseum; but few have taken the trouble to find what are, have been, or may be, the causes which led to it. The bigot cries, the Catholic religion; the sentimentalist calls it the beautiful mythical legendary tales handed down from generation to generation. The pedant calls it the barbarous survival of a Pagan time, the ignorance of the people.

In asking myself what may have been the origin, the cause of the so-called Gaelic superstition, I put away from my mind all I had read, all I had previously heard. I resolved not to indulge in vague theory or speculation, but to study the subject and inquire thoroughly amongst the people whether superstition did exist amongst them, and, if so, its probable cause.

My occupation peculiarly fitted me to thoroughly study the subject, and here let me enter a protest against the writings and opinions of those "birds of passage," the English residents in Ireland, whose knowledge of the Gael and his customs are very much on a par with that of the Irish exile "who knew New York well—he slept a night in it." Everything depends on one's point of view, and if people are credible enough to swallow the opinions of a literary parson living amongst a Catholic people and writing of them, yet completely out of touch, out of sympathy with them, not of their religious or race, I think they ought not refuse to hear the other side, the opinions of one whom the Gaels recognise as a friend, who has worked amongst them, has spent nights in their humble homes, knows their language, is of their race and religion—the dispensary doctor.

My inquiries were always met with the honest confidence that the overbearing sneer, the laughing ridicule would never come from me to hurt the sensitive informant. I knew every "wise woman" and every story-teller in the six parishes of my district, and I always took extreme pride in this—that "they forgot I was the doctor" before I had done with them. They were delighted that I did not, as is commonly done, sneer at their domestic cures, and when I told a village wiseacre that her tying with worsted thread the limbs of a patient bleeding from a wound was a survival of a practice sometime existent, to retain blood in the vital organs, she was triumphant in her pride; and when I found, to my astonishment, hysteroid convulsions in an adult, being domestically treated by liberal ablutions of water dashed on the sufferer, I may have laughed at the drastic treatment, but I could not deny that it was wonderfully efficient. I could not deny a tribute of praise to the acute observer, who could so readily distinguish between true epilepsy and the convulsions of hysteria, and when he gravely informed me that the water of a particular well possessed curative properties for this disease, I found on pursuing my inquiries that such reputation was founded on the fact that three generatons previously a "traveller" had made use of the said well to treat a sudden attack of the same disease in the immediate neighbourhood. That the "traveller" was supposed to be a very learned man goes without saying—that, like every quack, he made the most solemn prophecies about what would have happened had he not been available, so as to better his reputation, is not to be surprised at, and that the poor ignorant Gaels would have believed him is not to be sneered at by the highly educated public which accumulates wealth in these days for patent medicine purveyors.

And is it to be wondered at that when I suggested that any other source of water would do as well, that they would hardly believe me. They referred me to the story-teller—the first porter that leads to the sanctuary of Gaelic superstition.

THE STORY-TELLER OF THE GAELS.

He is generally an elderly man, and yet you will find that all his tales have originated in his golden youth. He can neither read nor write; he would have been, if educated, possibly a literary genius—a beautiful fictionist. He has been a dreamer of dreams. His character is a mixture of characteristics—a fiery-souled hate of the rule of the conqueror, an ardent love for his native land; a soldier, yet not a soldier; a lover of peace, of beauty, of refinement, of the glamour of wealth, of music; filled with all the charm which springs from association with the past, in viewing near his home the ever-present ruins of fort or castle or church; soothed, saddened, and cheered by turns, as the seasons pass him by with their every-changing aspect on the country side, his mind peoples the old ruin standing in the island on the lake with a galaxy of splendour as he sees it rising from the summer morning's mist to greet the new-born sun; as he sees it in the gloaming, in the moonlight letting its shadow so softly fall, fall into the placid water, when around him all is still and silent, and he thinks of the olden time, and transfers himself back to stand amidst the now dead men who in days of old sung, slew and suffered. Winter comes, and the cold wind sweeps across the moorland; no soft foliage clothes the trees; no song of woodland bird hangs on the evening air to make music to the watcher's ears; the old ruin looks cold, and wet, and dreary—then it tells him another story—of ruin, of slaughter, of the days when Ireland fell.

Every acre of his country is hallowed in legend and song; his life is one spent in Nature's solitude; his eye is as observant as the wild, free creatures of the air around him; he is imaginative only as his surroundings give him food for reflection; all the material is there for the story-teller; but yet he is young; he is too modest, although his fancy is fertile, and his ideas brightly drawn. He creates a story, and says modestly it comes to him; he lives on it, dreams on it; it is

ever present with him; he must tell it, and he does tell it. He tells it thus. As around the great fires the youth of the village assemble, and story follows story, and the good man in the corner waits until they all have finished, until, with the respect due to age and wisdom, they shall listen attentively to what they now wish to be told. By sundry and various hints delicately thrown around, this youthful aspirant for honours blurts out the main facts of his own creation, he speaks awkwardly and unconnectedly, and with the modest avowal he heard it from another. The old man fixes the youth with his eye, and sees through the modest veneer; he sees the imagination, the ideas, which came to him when young, the same external pictures prompting the same internal consciousness, and the youthful story-teller, frightened at being so easily found out, and feeling a shame that it should be thought that he, a stalwart, active, athletic farmer, should possess such a thing as the higher intelligence inappropriate in the old man, remains silent, but stores his fanciful creations in the album of memory until he, too, is old and able to command the respect and attention that age deserves, when he will tell his tale.

Now, even when he is old, the story-teller well knows that did he tell his hearers that his fiction was self-born they would not for a moment believe him, and so he often boldly declared that it happened and that he knew well the man who saw—and here he introduced his readers by the common path of all the Gaelic unlettered fictionists.

His first words are generally God bless and protect all our hearers. This awes all the unknowing ones into the belief that the tale is about people who it is harmful to talk about—to the knowing ones it means that the story-teller is going to tell a tissue of lies only, as all fiction is lies, and that the introductory phrase is meant honestly in the hope that the listeners will not carry away with them anything that may be hurtful to them from the story to be told. And here let me say, if the author of the modern neurotic novel gave us an introduction headed, well, God bless and protect all our readers, it might serve them, if honest like the Gaelic story-teller, in keeping on truly moral lines, and might protect the morbid neurasthenic craving girl from carrying away horrible pictures and ideas of passionate vice and suggestive desire from her readings. The Gaelic story-teller loves to tell his story, but he would feel that he would commit a grave injury and transgress the commandments of his Faith if his tale was not a perfectly innocent one. As the writer of "She" first leads us to a University before he brings us by swift steps to the African Palace, the story-teller brings us to every-day, ordinary commonplace life; and then swiftly, suddenly he brings us to the homes of "The Good People," or the "People Good," those popular folk in Ireland.

THE PEOPLE GOOD.

Shakespeare's "The Patricians Good" are good in worldly wealth; the Gaelic story-teller's "People Good" are people good in worldly wealth. They are those from whom he loves to pick the heroes and heroines of his tales—lovely women, stalwart men living in lordly homes, in wealthy halls, surrounded by beauty, loveliness, music, all the charm of youth, of golden summer; they are the creatures of his fancy, the dead men and women of the old ruins. He seeks only those as his characters, and this is the reason why: He will not paint with the brush of his fancy as lovely, beautiful and good, those in his land who have wealth, and dress in silk attire—for the aristocracy of the country are not of his race; they are the sons and daughters of the conquerer; he cannot, he could not praise them; they could never be his heroes or heroines. Perhaps, as I have often known his beautiful daughter of the People Good was but the dark rippling haired and blue-eyed Irish girl, the graceful slender girl who walked barefooted across the mountain heather to her humble home, and who, perhaps, is sitting attentive listening now to the old man, who describing her, clothed in all the glory, the sheen, the splendour of wealth, leads her to the People Good, a heroine, a lovely girl, a very queen.

But the audience pay no attention to particular items in devouring the splendid generalities. The career of the earthly one who carried the tale of that other great, wealthy, gorgeous, lovely world to them is closely followed. But now comes the story-teller's difficulty—his Kallikrates (to borrow a name from "She") leaves the home of the People Good, but how is he to be driven from it that the way may remain unknown to any aspirant afterwards, or in a way that may raise no hope in any of the listeners of pursuing such a futile path, if they are credible enough to believe the tale that is solemnly asserted to be true only to engage attention.

Sometimes he is killed outright, but not until he has divulged all that he has seen or heard. More commonly he is afflicted with a lingering sickness—"He never did a day's good from that day until the day he died"; and sometimes—"He went off to live with them a year and a day after, and they said he died, but, sure, it was the lady that loved him that drew him away and put something in his place at home." Now, the story-teller's tale must be morally good, for he would not and could not be allowed to tell amongst a circle of his young acquaintances anything that would offend or be indecent. He stands in this relationship to the educated writer of fiction.

His imagination is more fertile; he draws from the "character evolution of internal consciousness," and not from real life. He creates a tale, not for an army of readers unknown to him, or ignorant of his private and domestic life, character, but speaks to a limited circle of acquaintances, and is limited by their knowledge. He fears to do harm, because he speaks to a few whose prosperity and welfare he has good wishes for. He tells the story for amusement both to himself and his audience. He tells it not to reap a financial benefit by it. He often does good, as the author of a good book does good, by pointing a moral and illustrating the evil of vice and injury of man to man, and as the author often creates a morbid fancy, the Gaelic story-teller does.

It is not his fault more than it is the literary fiction author's fault. In one case it depends on the listener; in the other on the reader.

I have known an emotional girl made a superstitious slave by her belief in the imaginative tale of a Gaelic story-teller, but—and which is worse—I have known a young, highly-educated, and well-bred girl absolutely ruined, becoming a debased, destroyed woman—a slave to vice—through an acquaintance made with the books of a modern author, whose suggestive freedom from social and domestic customs in her heroines has set a fashion in the neurasthenic passion craving literature of the day. The Gaelic story-tellers have been the cause, the innocent cause, of part of what we hear as Gaelic superstition, and what we hear commonly as folk-lore, etc., is Gaelic imagination. The tales of the Good People are but romances sung to the dead men of our native land. That "the good people still live" is a pleasant association to us uneducated poor people with the halls of the wealthy, the music-loving, the refined, the beautiful, our ideals. That we believe in Deirdre or Chreena or Una the Fair is true, but they are our ideals of the sex we chivalrously admire, protect, and love to sing of. They are the heroines of our unwritten fiction. If we speak about them, if we sing about them—if a maid far beyond us as the skies strike our fancy, and yet that we must view from afar, and yet may flee an exile from our land. Does it matter, because when our hairs are grey and our children around us, we speak of her, the sweetheart of our youth, whom we loved as man can only love woman, and who is lying now, perhaps, in her cold grave, or away beyond in that other land, towards which the very sods of Irish turf do spring? We tell of her, and adorn her, as we would what we love, and if some poor half-witted fool or fools take too seriously our tales, and cry that "they are taken in the fairies," is it because they say so, and we laugh that we should no longer paint up the old ruins when the summer moon shimmers its silver sheen across lake, rivulet, and stream? Not we; and we shall tell our tales; we shall create high ideals, and let the materialist scoff; let the library scribe or bird of passage pitch down finished the cleverly-written fiction of an English author, and then seek his desk and drawing-pen and paper, write until the grey morning flits across the eastern sky, on "the traits and characteristics of the Gaels," "their gross superstition," and all the usual cant about the Catholic religion, the Pagan traits, and the sidhe or fairy religion. Educate them Gaels; then it will possibly be a sin to be a Catholic novelist. to be an author of works. Doubtless the people who now write the delirum tremens stories of the Martians and the voyages to planets beyond will beg to draw attention to the "gross superstitious imaginations of the Gaels."

Ah, poor Ireland! uneducated Ireland!—your every virtue is a cardinal sin. Your happiness would be to have but a demented people, who would eat, drink, sleep methodically, for dare you think you are superstitious—dare you have a fancy. You are a Pagan. Dare you possess any virtue. That virtue is a vice!

(To be continued.)

BUILDINGS THAT MOVE.

Experiments made in the Capitol at Washington, started originally to show the physical properties of the pendulum, brought out some strange facts in regard to the movement of the Capitol itself. The movement is due to the influence of heat and cold, producing expansion and contraction. A wire was hung from the top of the dome to the floor below, and on the end of it was a specially prepared plumb-bob with a lead pencil inserted in its lowest point. The point of the pencil just touched the floor, on which there was a paper. Every day the dome moved and carried the pencil with it in an elliptical track averaging 6in. long.

The dome starts moving in the morning as soon as the sun's rays strike it, and the pencil draws its curved track until sundown, when a reaction takes place, and it moves back to its starting place; but not over the same track, for the cool air of the night makes the dome contract, so that the pencil draws the other half of the eclipse. When the experiments were being conducted it was said that the time of day could be approximately told by the extent of line drawn. The Washington monument is so noted for nodding its head at the sun that the Government engineers have rigged up a permanent device there to show just how much it may be out of plumb at any time.

It may sound fanciful, but it is nevertheless a fact, that the Liberty Statue in New York Harbour literally waves a welcome and farewell to the vessels that ply up and down the bay, the tall office buildings bend their heads, and the Brooklyn Bridge rises and falls every day, having a special device to compensate this motion. There was not a sufficient accommodation for the great heat of last summer, and as a consequence certain irons gave way and impaired the safety of the structure.

All of us know how railway rails have their ends close together in summer time and open in winter: and when tracks are laid either in extreme cold or hot weather allowances have to be made for this change. The roofs of large buildings have to be supported on wheels or other bearings in order to allow them to expand in the day and contract at night without spreading the walls on which they are supported; and the famous Britannia tubular bridge is also provided with a similar safety device, or it would have racked itself to pieces long ago.

DUBLIN CANALS.

By T. O'C., BIRMINGHAM.

Surely our ancestors were easily satisfied when, on the completion of the Grand Canal to Monasterevan, something over a hundred years ago, they found they could journey from thence to the Metropolis, or vice versa, a distance of 30 miles, at the astonishing rate of some three miles an hour! A packet boat sailed from James's street Harbour (I quote from Watson's Almanack of 1792) every morning at six o'clock, and arrived at Monasterevan in the evening. Evidently the fly boat described by Mr. and Mrs. S. C. Hall, and which is illustrated in the "Dublin Penny Journal" of May 3rd last, was a much more modern affair, as the speed then was accelerated to seven Irish miles per hour. According to a time-table of 1804, referred to in an article in the "Evening Telegraph" about six years ago, accommodation was provided for first and second class passengers in the fly boats of that period, and the rate of travel was four miles an hour. A trip to Athy or Tullamore being a good day's journey, it was, of course, necessary to provide creature comforts for passengers, and so it was possible to dine for 1s. 6d or 2s 2d, according to class. A bottle of porter cost 6d, Dublin cider 10d, port wine (restricted to those who travelled first class and who ordered dinner) was 2s. a bottle. Smoking was not allowed; dogs, if brought into the cabin, were charged for as if they were human passengers, but, even in this respect, they had an advantage over servants in livery, who were forbidden to enter the first class cabin at all. In 1835 we read of the employment of iron fly boats on the Royal Canal between Dublin and Mullingar, and in the same year the City of Dublin Steampacket Company announced the conveyance of merchandise by means of steamboats, plying both on the Grand and Royal Canals. It does not appear that packet boats were propelled by steam at all, for, even to the year which witnessed the competition of the "iron horse," the Canal Companies guaranteed the contract speed of seven Irish miles an hour to be upheld, and this object was gained by the use of three horses to each boat, and the division of the entire length of waterway into easy shages, fresh relays of horses being provided at each stage. On the Athy line these stages were as follows:—1, Hazlehatch, 8 miles; 2, Sallins, 14 miles; 3, Robertstown, 20 miles; 4, Rathangan, 26 miles; 5, Monasterevan, 31 miles; 6, Vicarstown, 37 miles; and 7, Athy, 42 miles. The line to Shannon Harbour branched off at Robertstown, and was divided into the following stages, the distance being computed from Robertstown, which was the third stage from Dublin:—4, Ticknevin, 5 miles; 5, Edenderry, 8 miles; 6, Ballybritten, 11 miles; 7, Phillipstown, 17 miles; 8, Tullamore, 24 miles; 9, Cornolor, 31 miles; 10, Gillen, 37 miles; 11, Shannon Harbour, 41 miles.

The banks were in many cases bordered by rows of elm trees, which added greatly to the charm of a walk along the canal side, and rendered it one of the most popular promenades in the vicinity of Dublin. On certain evenings each week a band would perform in Richmond Barracks, and then, if the weather happened to be fine, might be seen a throng of people of all classes, young and old, enjoying the fresh air and listening to the strains of the music, softened by the proximity of the water. Innocent flirtation, just as prevalent then, as now, of a band evening at the Depot or Drumcondra Park, would be the principal attraction to the young people of both sexes, while, no doubt, their elders would gossip of the stirring incidents of the times. Occasionally there would be a display of fireworks at the neighbouring Vauxhall Gardens, at Ranelagh.

Frank Thorpe Porter, in his "Gleanings and Reminiscences," mentions that for some years prior to 1842 a very large number of persons were found drowned in both the canals, indeed, so numerous did they become that public attention was drawn to the matter, but it was only by a mere accident that the cause was discovered. It happened that on the 11th March, 1842, a few minutes before 10 o'clock, that a young man named Kinsella, who was employed in a distillery at Marrowbone lane, was proceeding, after his breakfast, from his residence, at Dolphin's Barn, to resume his work, when, on approaching the canal bridge, he was stopped by a constable, who informed him that the Coroner required his attendance, as a juror, on an inquest that was about to be held on the body of an old man, just taken out of the canal. Kinsella vainly expostulated against the detention. He was told it would be a very short business, for there were no marks of violence on the corpse; it would merely be a case of "found drowned." The man was accordingly sworn on the inquest, and the coroner having informed the jury that they were required by law to view the body, they were conducted to the apartment where it lay. As soon as Kinsella beheld the corpse he rushed forward, dropped on his knees beside it, seized the stiff and frigid hand, and exclaimed, "My father! my poor, dear father! We buried him on this day week, decently and well, in the Hospital Fields. He had no business in the canal, and them old clothes never belonged to him; he never wore a stitch of them." The coroner and the doctor vainly endeavoured to persuade Kinsella that he was mistaken, and his recognition of his parent produced an inquiry, which resulted in bringing to light some very extraordinary practises on the part of the county functionary and his medical satellite. They were paid by public presentment, according to the number of inquests held, and they had recourse to the expedient of having bodies disinterred, clothed in old habiliments, and thrown into the canal. Such bodies were almost always discovered very soon, and were taken out on the county side of the canal, to swell the coroner's next presentment for inquests on persons who were "found drowned." A crush from a passing barge afforded an additional profit, as the bruises constituted a plausible reason for a post mortem examination, and thereby doubled the doctor's ordinary fee. The coroner and his associate were convicted of conspiring to defraud, and consequently were deprived of their functions. It must be acknowledged that if their mode of procuring inquests was not honest, it was certainly novel and ingenious.

Nearly all the bridges spanning the canals, in the Dublin district were named after directors of one or other of the companies, thus over the Royal, there are Newcomen, Clarke's (at Ballybough road), Binn's, Blaquiere, and Reilly's bridges, and over the Grand Canal, Macquay's (at Grand Canal street), M'Kenny's, Huband, Macartney, Eustace, La Touche, Camac, Harberton, and Griffith bridges. Most Dublin people will know that the building at Portobello harbour, now used as a private hospital, was built as an hotel for the accommodation of passengers arriving and departing by canal boats.

A SPRING MADRIGAL.

Faint flutes at morn I heard
When April spake the word,
And bade her choir invisible across the moorland sing.

Then, louder on the air,
As if each blossom fair
A burst of utterance had found, I heard the earth-psalm ring.

Unto the gates of May
Fair April led the way,
With all her fairy host allured and my heart following.
Free from the thought of pain,
We trooped, a joyful train,
And sang ourselves, and sought to make the mournful worldlings sing.

Far from the haunts of man,
Out where the great god Pan
Lifts his wild reed and lures us on, we minstrels troop and run;
Flushed with the fire of spring
We only seek to sing,
And bathe ourselves in dreams of love beneath the April sun.

So runs my heart away
Toward the white hills of May,
Where daffodils and daisies are the springtime snow, I ween;
The sweetest life we know
When April's trumpets blow,
And all her courtiers call to us to follow with their queen.

Charles T. Schoen, of pressed steel car fame, announces that the pressed steel car wheel has demonstrated its utility by a severe test in actual service, and the new plant projected for the manufacture of the wheels will have an initial capacity of five hundred wheels per day.

OUR WEEKLY STORY

THE DAY OF THE FIRE.

The trainmen of the main line called the L. and B. Branch "the family cinch." It was a twenty-mile spur, running north from the State Central, and connected Lovell Junction with the village of Baxter. Its trains were four a day: passenger down in the morning, mixed back at noon, mixed down at half-past three in the afternoon, and passenger back at six.

One train crew did all the work, and the crew "was all in the family." Jotham Hale was the engineer, and had tooted for cows and crossings on the branch ever since the days of the "cow-lily stack" wood-burners. Seth Hale, his eldest son, was conductor; Asa, his youngest son, was fireman, and another son, Ira, was station agent at Baxter, where all the Hales lived.

Asa was seventeen years old, and was the family pride on account of his ingenuity, a word that expresses a great deal in Yankee land. From the time when he could first run about he had devoted to the trains and the station all the hours he could get from his school.

So it came about that even before he was hired as fireman he could "spell" any member of the family, which was convenient for the family, for the father and brothers had several rather engrossing personal interests, such as gardens and horses and positions in the village fire department.

"Old Man" Hale was, quite naturally, the chief engineer of the steamer. Seth was foreman of Hose No. 2; and the station agent, Ira, was chairman of the citizens' committee, whose duty it was to look after property removed to the street during a fire.

We are now qualified to understand what happened when the "big Baxter fire" broke out.

The noon train had been in at the station ten minutes. Jotham Hale had backed the uncoupled engine down opposite his house below the station. He owned a tract of land half a mile down the line, and his big barn was close beside the track. Morning, noon, and night the train arrangement exactly suited his chore time.

Half an hour before leaving time in the morning he was in the habit of loading his pails of swill into the cab and running the locomotive down to the barn. Noon and night he did the same. The neighbours used to smile and say that pretty soon "Old Man" Hale would be using the engine to pull his mowing machine and his harrow.

Now on this day the engineer was just hoisting two pails of steaming provender into the cab. All at once came a clamour of voices from up in the village. Then dong! dong! the Methodist bell boomed out. It was followed, cling! clang! cling! by the bell on the Congregational Church.

"Fire, boys!" shouted the chief engineer, running to the house for his rubber coat. As he came out he cried to Asa, "Look out for Old Hoss!" "Old Hoss" was the family name for the locomotive.

Behind his father ran Seth, buttoning his fire coat. "Lock up my ticket-box, Asa," he yelled back.

Then Ira, of the fire committee, bolted out of the station and came running down the long platform.

"Tend the office while I'm gone, Asa!" he gasped, as he ran past. "Keep your ear out for messages."

Asa was quite unaccustomed to being sole ruler in the station. He took a look at the gages in the engine, sprinkled fresh fuel on the quivering bed of coals, slowed down the pump till it breathed its "oo-o-wough" as slowly as a tired man asleep, and then he went up to the station.

"That fire looks rather savage," he thought.

A great dun column had gone straight up, pushing a mighty, balloon-shaped, yellow and black knob. The knob had begun to "blossom" into rolling, puffy, ominous convolutions and tumbled high above in the upper air-currents.

Ten minutes later the first selectman came slewing around the corner of the station in his Concord wagon. He sprang out before the horse had fairly stopped, and thrust a telegram under the wicket.

"Here, Asa!" he shouted. "Send it as quick as lightning will take it! Baxter is spoken for, I guess."

As Asa clickety-clacked the Lovell office call, he read aloud—

"Chief Fire Department, Lovell—Baxter burning up. Can you send help on special?—O. Burrt, Selectman."

"That's right!" corroborated the Selectman. "Hustle it!"

As the message went rattling away the Selectman explained, "It caught in the sawmill and leather-board factory, and they're afire from stem to stern. The grease in the leather-board place flashed up like powder and oil. All the Main street blocks this side are ablaze, and clots of fire are dropping everywhere out of that first smoke cloud. There's no telling where it's going to stop."

"We ought to hear in five minutes," said Asa. "They'll telephone it to the chief."

He watched the smoke rolling higher and more dense. The selectman kept his eye on the mute telegraph-sounder. Suddenly it began to rattle. The Selectman could hardly restrain himself while Asa translated—

"Will start special as soon as can be made up.—Chief, Lovell."

"Good!" exclaimed the Selectman. Out he ran and galloped his horse back into the village.

"Let's see," mused Asa. "To get a permit for the special, to load and run up here, will take a good part of an hour, best they can do. But 'll slip Old Hoss off the main line now, to make sure." He hurried down and climbed into the cab. There were the pails of swill.

"Those poor critters ought to be fed!" he muttered, remembering the plight of the patient stock at the barn. Asa was a sympathetic and thoughtful youth in all cases where animals were concerned, and only a country-bred boy realises the importance of chores.

"I can do it in a jiffy," he thought. "There's no knowing when they will get fed if I don't take the time right now."

Without hesitation he pulled the throttle and started for the barn. The railroad man that he was, Asa realised that he ought to be at the telegraph instrument, but he hoped these few moments, stolen for the sake of the beasts, would make no difference.

Almost before the engine came to a halt at the barn he was out and down with the pails and inside the door. He slopped the swill into the troughs, frantically jammed hay into the mangers, and then ran out.

There was a heart-chilling blank in the landscape where Old Hoss had stood. Rods away down the track the locomotive was lumbering along slowly, its faint and moderate chuff! ugh! chuff! telling that the throttle-bar was out a notch or so.

Whether in his haste he had failed to drive the lever in securely, or whether the engine had started to roll on the grade and had jarred the throttle open, Asa's sudden, frantic conjecture could not determine.

But he fully realised that it was a case where haste had made waste. Old Hoss was travelling off leisurely, and already was rolling out upon the trestle and taking the long curve by the river.

Now, the topography of the land below Baxter is rather peculiar. On minor branch roads contractors build around hills and dodge ravines. Just below the village the L. and B. track is especially sinuous. It comfortably follows the river, which sweeps around a great hill and curves back towards the village like the tail of the letter S.

The distance around the hill to South Baxter is five miles by the railroad. Across lots, and along one of those old New England highways of the forefathers that went straight ahead regardless of hill or valley, it is less than two miles.

Asa, standing there by the track with the empty pails in his hand, thought quickly and desperately. It was useless to pursue Old Hoss down the track. Probably the station agent at South Baxter was then at dinner, otherwise Asa could have called him on the wire and asked him to shunt the engine.

With a great thrill of fear Asa tore a bridle from its peg in the barn, fiercely pulled an astonished horse from his dinner, and the next instant was clattering down the dusty road, pounding with fists and heels, and shouting into the frightened animal's flattened ears.

Already from the country to the south the farmers were hurrying up toward Baxter, summoned by the signal smoke of the conflagration. Rattling wagons were kicking clouds of dust behind, and under the drifting cover of it men and boys were running and puffing.

Yelling as he galloped, Asa narrowly missed riding down dozens of these dust-hidden pedestrians. Astonished farmers jerked their horses to one side as he thundered past.

When he galloped down the hill toward the white crossing-post at South Baxter his hands were clutching the mane and his heels were hooked against the animal's steaming flanks. The horse was fairly running away.

Time and time again was Asa nearly dislodged, for he was riding bareback without stirrups. But he gathered all his strength, and when the horse's hoofs struck the crossing planks he dragged the snorting beast back on his haunches.

He looked up and down the line. The curve above shut off the view except for a short half-circle. Below was a two-mile tangent. Old Hoss was not in sight. There was not even a whiff of smoke down the tangent.

"She hasn't passed!" was the sudden, wild, thrilling flash of thought that steadied Asa's swimming head. Then he galloped beside the track to the small station building. The agent poked his head out of the window.

"Has Old Hoss gone past?" gasped Asa.

"No, but it ought to be going past," snapped the agent; "that is, if your family expect to keep their jobs! Seems from what I hear that they got in too much of a hurry down in the Lovell yard, and the engine bumped off the track at the Y switch frog as they were making up. There's no other spare engine in reach on the division, and they've been drumming Baxter to send down your engine. Reckon the division super must be in a padded cell by this time if the operator has told him. Hear?"

Out from the open window came the angry cracker! chacker! of the instrument. Asa wheeled his horse.

"Break in and report special south according to orders!" he cried, and he dashed away up the track on the shoulder of the gravelled bed, the horse's labouring hoofs throwing the sand in jets like a fountain. He had seen Old Hoss just rounding the curve.

As he approached the advancing delinquent, he whirled about and waited till the engine rumbled down on him. Then, as the cow-catcher came abreast of the plunging horse, he drove his heels against the animal's ribs and raced along for a few feet.

The locomotive was travelling leisurely. As the step came past, Asa threw down the bridle reins, grabbed for the hand-rails, and dragged himself into the cab. The horse swung away into the field.

The next instant, throttle wide open, engine throbbling, and the white flames in the fire-box quivering with the exhaust blasts, Old Hoss roared past the South Baxter station, the whistle screaming for the crossing.

The station agent stared from his platform after the locomotive till it was far down the tangent.

"Well, I swan!" he gasped. "Has the H family got Old Hoss so well trained that t let him go out for a stroll alone?"

It occurred to him that he ought to repo and he hastened to his instrument. The soun had been quiet for a little while; but now, j as he was about to call Lovell, that po called Baxter once more with impatient rack Failing to get a response, the Lovell opera called South Baxter. It was a caution m sage.

"Hold track clear for fire special. L here 1.22."

The South Baxter agent gasped; then grabbed his sender-key and rattled this m sage:—

"Special engine just left Lovell."

"Hold at South Baxter," clacked Lov very naturally not dreaming that a spec could have been unreported as leaving Baxter terminal, a special that had not as officially acknowledged receipt of orders start.

"Has already passed," clicked South Baxt with a tremble in the sending hand. Betw South Baxter and Lovell there were only f stations, without agents or signals.

"That's what comes of dipping in where don't belong," said the South Baxter m drawing a quivering finger across his perspir brow. "It's going to be the worst smash ever was on this road!" he moaned. "A there's nothing to do but just sit here and things go. Reckon I'd better go climb a t and then pull the tree up."

Again the sounder began to rattle. snapped bitter reproach at the South Bax agent as the only victim in reach at the ti He broke in and sought partially to justify action.

The man at the Lovell end was the k agent. He informed the South Baxter n that not only was the division superintend on the fire train, but the general manager the system as well. In fact, it was owing the general manager's presence that the d culty of the engine had been arranged.

The Lovell operator explained that the nager's special had come along on the m line a little before; and when he learned of fire and the delay, he ordered his engine take the fire train. Naturally, he went alo too.

All at once the fierce "cnack" of this lo range colloquy was interrupted by a "bro in." The two white-faced men who w sitting fifteen miles apart listened with dr ing jaws to the nervous clack! click! cla As the staccato jerked out its informat each man started from his chair and shou with joy.

And this was what had happened.

All the way down the tangent below So Baxter Asa had been stoking and studying gages. As the jolting engine swung ro the first curve he climbed to the engine cushion and put his head out. The billow wind swept against his streaming face. troubles were clearing.

But suddenly he thought of the situatio the Baxter station that he had been compe to desert under such desperate necessity. realised that if telegraph calls were not swered at such a critical time, and that if superintendent arrived there and found place deserted by all the Halles, the fa would in all probability be retired to think matter over.

In some way his people must be appr Someone must be called to the telegraph strument. The livelihood of the whole fa depended on it.

Again Asa's ingenuity was equal to emergency. Tucked in the box under cushion he always carried a coil of wir telegraph instrument, wire-cutters and cl ers—a linesman's outfit. He jammed dow throttle, set the brake, and as soon as th comotive grated to a halt he seized his t and in thirty seconds was up a teleg pole. A few minutes sufficed for him t stall his relay box.

The wire was still busy, as the immediate chatter of his instrument indicated, and he waited a bit to learn the condition of affairs before he acted. His intention was this: To ask the agent at South Baxter to send a messenger post haste to Baxter and hurry his brother Ira to the station.

But Asa heard with bristling hair the despairing laments and bitter taunts passing between the two operators. He heard that the special had started from Lovell, and was then coming up the rails at a mile-a-minute speed.

With nervous haste he broke in. His hand trembled so with fear, joy, and excitement that he could hardly work the key. But his few jerky sentences sent two men out of their chairs, shouting with delighted surprise.

It must now be a race between lumbering Old Hoss, with only one slender youth as both engineer and fireman, and the great engine of the general manager's train, with its seven-foot drivers and its mighty reach of piston-rod.

Asa left his instrument still clicking, ran to his engine, swung himself into the cab, threw down the reverse lever, and started. His drivers throwing sparks as they whirled for a clutch.

He glanced at the chronometer now. The fire train must be close on him. His swaying, drooping trail of smoke obscured his vista down the track, but he knew that just beyond the veil the pursuing engine was quivering at the head of its train.

He screamed a shrill whistle warning for the crossing at South Baxter. When he roared past the station he flung a gesture of greeting to the agent, who swung his cap and danced in delight on the platform.

As Old Hoss wrenched round the curve, Asa, through the shredded smoke, perceived the fire special far down the tangent. By the white jets puffing against the pall of its smoke, he knew that it was hooting at his fleeing engine in hoarse and fierce protest at its presence on the right of way.

But Old Hoss gathered herself in renewed effort, and thundered on desperately along the snaky five miles between South Baxter and the terminal. The sign-board at the south end of the trestle warned "Slow!" But Asa rushed the engine across the groaning structure, and drove up the track in the yard limit to the roundhouse siding. Then he reversed and pulled Old Hoss to a stop that jarred her in every fibre.

Jerking out his keys as he ran, he flew to the switchpost, and in two minutes had his engine safely off the line. He stood there, still with his hand on the switch-lever, when the fire train rumbled past, men crowding its "flats" and massed around the gleaming steamer and host trucks.

The station yard was full of citizens, who were down to assist in unloading the equipment of their neighbours in the south. Asa hurried through the crowd and burst into the telegraph-room. Ira was there at the instrument.

"I didn't hear you had cleared out and left till twenty minutes ago!" Ira grumbled. "I happened to come down with the rest and found the office open. Since then Lovell and South Baxter have been filling me up on what has happened, and what will probably happen, as soon as the division super gets at us. What have you been trying to do?"

Asa interrupted his brother's complaints. "Old Hoss got away from me and I chased her; that's all there is to it," he panted, wiping the perspiration out of his eyes. "I just did the best I could, Ira, but I'm afraid the way things look now, there's going to be trouble when the management begins to investigate. There's no use talking; we've run things rather slack up here on the branch."

Then he told his story hurriedly, Ira listening with mingled wrath and amazement. Outside were the shouts of hurrying men, the squeaks of pulleys, and a tumult of excitement, as the equipment was unloaded.

Over all rolled the smoke from the conflagration that now had swept half way down Main street.

"There'll be no question asked until after this is over," said Ira.

He grabbed the telegraph-key, called both South Baxter and Lovell, and rattled off a long message. Asa listened, occasionally scrubbing his sleeve across his sooty forehead.

"Do you think that is the best way?" he asked, finally, his question inspired by the discussion over the wire.

"I don't know. Both of them say they'll back up any story we give 'em," "They know just as well as we do that if the manager gets a ripping things up on this branch it may mean a clear sweep. Just those two operators know how close a shave it really was. The only thing we need stick to, I suppose, is that we got the orders, sent the engine to South Baxter, and came back when the signals there blocked us. I dont want to do it, though. I never lied out of a scrape yet, and I don't like to begin now. Think it over, Asa, and I'll see you to-night."

Asa was very thoughtful during the remainder of the busy day.

That evening, while the steamers were extinguishing with hissing streams the last red fires among the blackened beams, Asa had his talk with the general manager in the latter's private car on the side-track. The manager had summoned him.

"Young man," said he, "I have been making some inquiries, and I find that your relatives left you to run this whole branch to-day, and that they have been doing the same thing for some time. Local public spirit is a good thing, but sometimes we need our men ourselves. I find you got the engine out alone and ran as far as South Baxter. You were here attending to your business, so I now promote you to the engineer's job.

"At the same time, I think we shall give the rest of your family an extended vacation, so that they can catch up in their public and private affairs."

The general manager swung around in his revolving chair and began talking with the division superintendent, signifying that Asa might retire. But Asa stayed, rolling his cap in his hands.

"I should like to say just a word," he requested, humbly.

"I'll listen to no plea for your father and brothers," said the manager. "They are discharged."

"I think I'm the only one who ought to be discharged," said Asa.

It was the most bitter humiliation of his life, but he had made up his mind to it long before. He told his story through, not seeking to shield himself. The manager surveyed him after he had finished, his fingers tip to tip and his eyes steely.

"Do you think that a simple discharge is punishment enough for imperilling fifty lives and a hundred thousand dollars' worth of property for the sake of some pigs and a few old cows?" he demanded.

Asa choked. He was merely a boy. "I realise what I have done, sir," he said.

There was a long pause. Then the manager leaned back and crossed his legs.

"But you had wit enough to save this road from damage suits that would have cleaned out our surplus and given us a floating debt," said the manager. Then he spoke more kindly. "My custom is to reward intelligence, honesty, and loyalty on this road."

He turned to the superintendent. "Peters," said he, "here is such a case as I have spoken to you about before. The thing that boy has been through to-day is a liberal education in the railroad business. Until a railroad man has been close to a thing like that he isn't an absolutely safe employe. Some people figure differently, but that's my notion. Young man," he said, "we need well-educated men, and I really do believe that the Hale family has taken the full degrees. You're all discharged, but your term of service will recommence to-morrow morning in season to take down the first train. Good night!"

To be sure, the railroad men of the State always have said that this general manager's great success in getting the most out of his men comes from his complete understanding of human nature. Here was another example.

The L. and B. Branch? Why, they are martinets in discipline and devotees to attention there now!

MEMORY.

Sad, as the waves of the low-moaning ocean,
Break in the light of the moon on the shore—
Fitful, as music, when winds set in motion
Strings of the air-lute their wings tremble o'er;
Pure, as the spring from its fountain-heart welling
Through the hot sands in the wilderness lone,
Come back again from their shadowy dwelling,
All the dear memories of days that are gone.

Childhood—its light-hearted sorrow and pleasure,
Smiles like the sunlight, and tears like the dew;
Youth—rich in love, as a vase filled with treasure;
Prime—with its dreams of the grand and the true.
Sunlight and dew-drop will come back at morning,
Night give new dreams, and the vase find new store;
Life! on thy stream there is no more returning—
Memory! oh, give back the sweet days of yore!

PICTURED ON ROCKS.

CLIFFS IN ARIZONA ORNAMENTED WITH MAPS CENTURIES OLD.

The oldest maps in America are to be found in Arizona and Texas. How old they are may not be said, but they date back many centuries. The Indian has left behind him many records. In his rude implements of peace and warfare—his knives, arrows, axes, spears, vessels, mortars, quoits, etc—we can read to-day the history of prehistoric races, their habits and customs, their social life, their tribal relations, their occupations and their pastimes. From picture writings we gain additional insight into the ways of these primitive people. It now appears that some of these early dwellers in the land were map-makers of no mean ability. The traditions of some of the tribes of Arizona and New Mexico point to a common origin with the Montezumas. It seems quite certain that the nations or tribes occupying the country now known as New Mexico, Arizona, Texas, and Mexico held intimate relations with each other, and their inhabitants travelled back and forth from country to country for centuries.

In Tenaja canyon, Texas, are unmistakable evidences of this. The lay of the land is such as to make this canyon the natural pass for a large area of country north and south of that point. The travel which has passed through this canyon has worn the solid rock of the trail to a depth of not less than three feet. Even though the region about were densely populated, it must have taken centuries to wear through the adamantine path. The walls of the canyon, which are perpendicular and smooth, are embellished with lines carved in the rock, and then traced over with paint of a vermillion hue, so permanent as to have lost but little of its lustre during the centuries it has ornamented the rock canvas.

The first discoverers of these markings were unable to decipher them or guess their import, but subsequently prospectors and plainsmen who visited the canyon discovered in these lines accurate maps of the country, with the trails, mountain passes, and water holes indicated thereon. The makers of these maps showed a thorough knowledge of the country and accuracy as to relative distances and points of the compass. Near Oatmans Flat, Arizona, are what are known as "Pedros Pintados," or painted rocks. The walls of the mesa are covered from base to summit with drawings of men, animals, reptiles, etc. Some of the figures are of so uncertain a nature as formerly to have failed of classification. It is now known that some of these are maps of sections of country, with trails, villages, water wells, etc., indicated upon them. It is somewhat remarkable that among the animals pictured on these rocks are camels so life-like as to admit of no doubt as to their identity. There can be little question but the makers of those pictures had knowledge of Egypt or Arabia, or that the camel was once indigenous to this country.

NOTES AND QUERIES.

KNIGHTS OF THE SHIRE.

Having recently seen in your journal an allusion to "Knights of the Shire" (I presume a Parliamentary appointment), could any of your readers state up to what period the same existed, and whether the courtesy title of "Sir" was added to the designation of the individual holding the same. —R.S.C.

DR. T. M. MADDEN.

In an obituary notice of the late Dr T More Madden, of Dublin, it was stated that besides the biography published in 1891, of his more celebrated father, Dr R R Madden, who was such a prolific writer in his day, and his History of the O'Maddens of Hy (Dublin, 1894), he also brought out a centenary edition of his father's work on the United Irishmen. By whom was the centenary edition published? It is curious how little seems to be known of Dr R R Madden, in spite of the above-mentioned biography by his son, and yet what career could furnish such material for romance for as he writes of himself in one of his books: "It has been my fate to have been taken for a spy in Syria, to have endangered my life in Canada for refusing to administer poison, to have been shot at in Canea twice, and once on the Nile by Turkish soldiers, to have been accused of changing the fragments of a broken statue into gold at Thebes, to have been charged with sorcery in Nubia for showing an old woman her face in a pocket mirror, and to have been captive with Greek pirates for wearing a long beard, when taken on board a vessel bearing Turkish property. In Syria I was repeatedly in the hands of banditti, and to good humour alone, unruffled temper, and cheerful demeanour, I am indebted for making Children of Mercy of those who proved pitiless enough to other travellers."—Elector.

THE EFFECT OF IVY ON BUILDINGS.
LETTER FROM THE SECRETARY OF THE BOARD OF WORKS.

We have received the following important letter in reply to the query lately printed in our columns:—

Office of Public Works, Dublin,
27th May, 1902.

Sir—In reply to your letter of the 12th inst, enclosing an issue of the "Dublin Penny Journal" for May 17th, I am directed by the Commissioners of Public Works to state that their experience is that ivy is most injurious to all ruins. Saplings, and all other forms of vegetation, especially when growing out of the walls are also injurious, but ivy is the cause of more harm than other forms of vegetation.

The practice of the Board is to remove ivy where it causes or threatens injury. In some cases it suffices to trim it, or remove only a portion of the growth.—I am sir, your obedient servant,

H. Williams, Secretary.

The Editor, "The Dublin Penny Journal," 90 Middle Abbey street, Dublin.

My observation as far as it goes leads me to the following conclusion:—If ivy is kept closely cropped it protects old walls from exposure to rough weather, and even binds the stones and holds them together, when they might otherwise fall away, but if ivy grows too thick and heavy on top or sides, or forces its shoots through walls, it becomes destructive to the ruins, and should be cut off. It is certainly pretty as a rule, and on plain walls ornamental, but should never be allowed to cover cut stone work, mullions, etc.

As no one else has replied to "Barn," I give my view for what it is worth, and so invite comment and discussion.—E. R. M'C. Dix.

THE TOWER NEAR LANDSCAPE.

There is an account, accompanied by a plate of this tower in the "Sentimental and Masonic Magazine" for January, 1795. The tower is said to have been built about the year 1741—a time of great famine in Ireland—by a Major Hall, for the purpose of giving employment, and was known during the eighteenth century as Hall's Barn. A similar structure known as the Wonderful Barn, was erected about the same time at Castletown, in the county Kildare. It has been described in the "Kildare Archæological Journal" by Lord Walter Fitzgerald.—F.E.B.

THE

LAMENT OF DEIRDRE.

By FRANCIS JOSEPH BIGGER

"My beloved, do not go with him, whose cry is sounding through the bushes and along the lake shore, my heart misgiveth me. Do not trust him nor listen to his winning words."

So spake Deirdre, the beautiful, the child of disaster, as she threw her arms around the neck of her spouse, and pressed hot kisses upon his cheek. "Listen not to his message nor his fair promises, which are like the galt nuts of our own sweet woods of Erin—fair without and deceitful within. Long have I dreamed that King Conchubar would press our return to his regal halls at Emain Macha that he might undo me and slay you, my heart's treasure. Are not the shores of Lough Etive a paradise to us, have we not here lived enchanted lives, is not the roebuck of Alba as swift as any in Erin, and is not my fleet one more than his equal in the chase; have we not here enough and to spare, and are not thy brothers with thee, and have they not treated me even as a sister?"

Then did the false Fergus, with his sons Buine, Borb and Ioltan Finn, and Callon, the shield bearer, step into the green booth of Naoise and Deirdre, and unfold there tidings from King Conchubar, and how they, the King's message bearers, were surety for their safe conduct to Royal Emain, where a great feast was prepared to welcome them.

Naoise and his brothers Ardan and Ainnle, the children of Usnach, doubted not the prince's promise, but Deirdre was very sad and sorrowful, for she had no trust in King Conchubar.

The high cliffs of Alba were parted from with tears, as the prow of their stout boat clave through the sounding waters of the Moyle until Benmore was neared and the track of the Fear liath* passed and the smoother waters to the west entered, where low shelving rocks jut out into the ocean known as Carrig Usnach to this day.

The children of Usnach leap ashore, wading through the strong surf, and upon their stout shoulders land Deirdre dry upon the beach, quickly followed by Fergus and his band. Then many a wild glad cry is given in joy for their safe return to Erin, but only tears brighten the face of Deirdre. Swiftly the strong fort of Dun Rainey is passed, beside whose desolate banks in later years the stout walls of Bunnamargie were to be reared by the brothers of Saint Francis, and up Glentaisi, where the birds sang sweetly amongst the copse, as yet unreddened by the blood of O'Neill and MacDonnell, which was in future days to run in rivulets, where now only the pure stream rushed over its stony bed.

"Fear not Deirdre, my heart's core, all will yet be well, thy fears of King Conchubar are groundless," said Naoise to Deirdre, but Deirdre only clasped her beloved more tightly, weeping as she did so.

And anon the palace halls of Emalin and the tents of the Red Branch Knights are reached, and Naisi, Arden, and Naili, with Deirdre, find royal apartments fitted for their use.

King Conchubar carouses in his hall amongst his knights and clansmen, until, inflamed with wine, he inquires if Deirdre's beauty is still upon her. His spies tell of her surpassing loveliness, and the King's desire hastens his plans.

His followers fall upon the children of Usnach, who are at first defended by Fergus' sons until King Conchubar, by offers of territory, obtains their desistance or they are slain.

*Now the Grey Man's Path.

Then Naoise, Ardan, and Ainnle fight t
the end to protect their Deirdre from the Kin
until all are slain, and Deirdre, with tea
and cries, falls dead upon the body of h
lord.

Dig the grave both wide and deep,
Sick I am, and fain would sleep.
Dig the grave and make it ready,
Lay me on my true love's body. (Fergus

A fateful disaster soon fell upon Kin
Conchubar, and his high halls were left des
late, and Emain Macha is now a field f
cattle, its proud past unknown to the he
who wanders around its well-nigh obliterat
battlements.

The waves still break on Carrig Usnach
and the roar of Moyle still dims the ear, a
the plaintive cry of the seabird is heard li
the ghostly echo of centuries, the voice
Deirdre weeping for the children of Usnach.

Ardrie, Belfast.

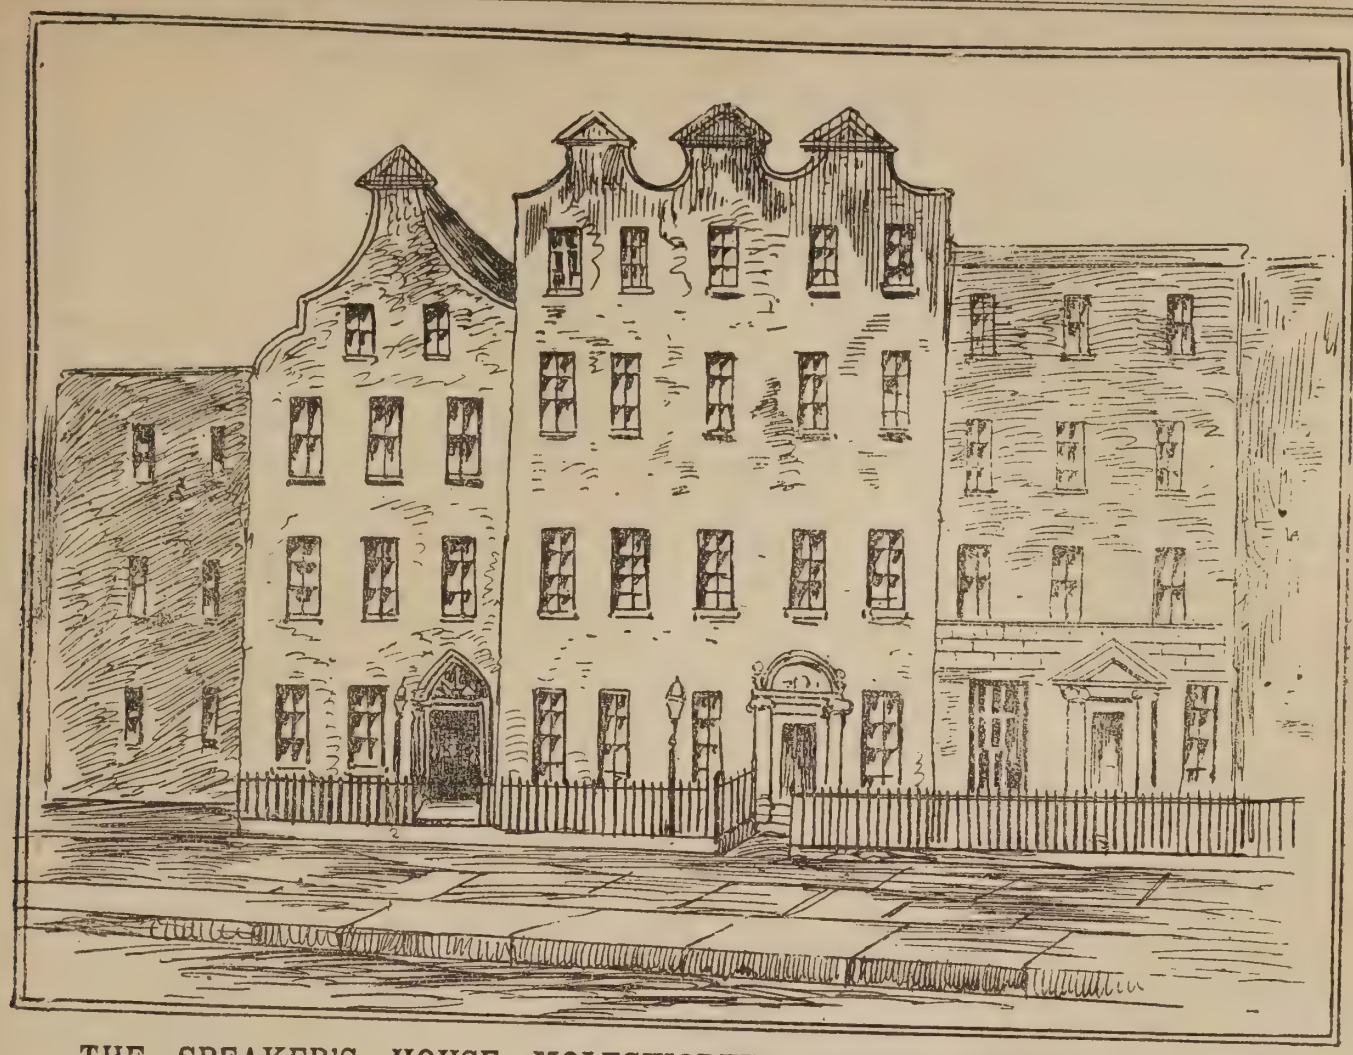
THE SUBMERSION OF THE TOWN OF I

(From the Barzaz Breiz, or Popular Songs of
Brittany.)

Aloud, then, cried the man of God to Grandlo
King of Is,
"O, yield not up to pleasure, for it has a bitt
bliss;
And the grief that ever follows, gives a pang
sharp as this—
Who eats the flesh of fishes, shall by fish be eat
up—
Who drinks of wine and mead, shall rue the ov
flowing cup!"

Then spoke King Grandlon: "Gentle guests, I
awhile to sleep."
"O, sleep at morn! but watch with us; for
must wakeful keep."
He went. Then, low, with honeyed words, li
music in her ear,
The lover to the Princess said—"The key? Dah
most dear."
"The key," she fondly answered, "shall be thin
the fountains flow,
And, as they leap beneath the stars, we'll dan
and revel too!"

Ah! see, there sleeps the aged King, upon h
purple bed,
His white hair falling like the snow, is o'er h
shoulders spread;
His chain of gold is round his neck; O, hush! w
cometh there?
Whose white feet glideth o'er the floor, li
moonbeam thro' the air—
She stoops, she bendeth on her knee, she tak
the key and chain—
Then, like a moonbeam thro' the air, she glide
back again!



O, hark! what shout of woe was that? "Awak
King Grandlon, fly!
The fountains spring, the Town is lost, the wat
mounteth high—
The dykes have burst, the sea rolls in, and
thy people die!"

Ah! who goes there? "O ranger bold, thro' mi
night, drear and deep,
O ranger! thro' the valley, hast thou seen the wi
horse sweep?"

"I saw no horse; but heard all night the wi
wave's moaning swell;
With 'trip and trep,' with 'trip and trep,' I kno
their voices well."

O, fisher, by the ocean's brink, hast seen the se
maid fair,
With golden comb, at noontide sun, array h
flaxen hair?"

"I saw the maiden of the sea. I even heard h
sing.
Her voice was like the coming waves—as sad a
murmuring!"

THE SPEAKER'S HOUSE, MOLESWORTH STREET, DUBLIN, IN 1834.

THE HOUSE OF THE SPEAKER OF THE IRISH PARLIAMENT

ITS HISTORY AND ASSOCIATIONS.

In Gilbert's "History of the City of Dublin," the following description of the building shown above is given:—

On the western side of Molesworth street stood "Kerry House," the residence of the family of FitzMaurice. Thomas FitzMaurice, twenty-first Lord of Kerry, was created Viscount Clan Maurice and Earl of Kerry, in 1722; in his house died, in the year 1707, John Lord Cutts, one of the most valiant soldiers of his time, who acquired the name of the "Salamander" from the great intrepidity which he displayed amidst a murderous discharge of artillery at the siege of Namur, in 1696. Cutts received the title of Baron of Gowran from William III., and during the part of Anne's reign, held the office of Commander-in-Chief of the British troops on the Continent, his withdrawal from which, by being appointed Commander of the Forces in, and one of the Lords Justices in Ireland, in 1705, was supposed to have caused his death. He published a collection of verses in the year 1687, under the title of "Poetical Exercises," and having obtained a captain's commission for Sir Richard Steele, the latter dedicated to him his theoretical treatise named the "Christian Hero;" and in the "Tatler" quoted his Lordship's love verses as those of "honest Cynthio, a man of wit, good sense, and fortune." Lord Cutts "hath abundance of wit," said a writer in 1703, "but too much seized with vanity and self-conceit; he is affable, familiar, and very brave. Few considerable actions happened in this as well as the last war in which he was not, and hath been wounded in all the actions where he served; is esteemed to be a mighty vigilant officer and for putting the military orders in execution; he is pretty tall, lusty, well-shaped, and an agreeable companion; hath great revenues, yet so very expensive, as always to be in debt; towards fifty years old."

The first Earl of Kerry married Anne, only daughter to Sir William Petty, through which alliance the estates and honours of the Shelburne family subsequently passed to the FitzMauricces. Lady Kerry was one of Swift's most intimate friends; and the following details, connected with this family, illustrate the style in which the establishments of the Irish nobility were maintained in the early part of the last century:—

"Dublin, March the 24th, 1732-3.—We have been informed that the Right Hon. John FitzMaurice, Esq., High Sheriff of the county of Kerry, received the Judges of Assize at the bounds of the county, in a most magnificent and splendid manner, the particulars of which are as follows:—Two running footmen led the way, being clothed in white, with their black caps dressed with red ribbons, and red sashes with deep fringes. Four grooms leading four stately horses with embroidered caparisons, their manes and tails dressed with roses of red ribbons. A puge in scarlet, laced with silver, bearing the Sheriff's white rod. The High Sheriff in scarlet, his sword hanging in a broad shoulder-belt of a crimson velvet, covered with silver lace, mounted on a very beautiful horse, having a Turkish bridle, with reins of green silk intermixed with gold, the caps and housings of green velvet, that was almost covered with gold lace, and bordered with a deep gold fringe. Two trumpets in green, profusely laced with silver. Twelve livery men, in the colours of the family, mounted on black horses, from £20 to £40 price, with long tails, which, as well as their manes, were decked with roses of red ribbons; the caps and housing having a centaur in brass, which is the crest of the Fitzmaurices. They had short horsemen's wigs of one cut, with gold-laced hats. Their back-swords hung in broad buff belts. Their cravats or stocks were black, fastened with two large gilt buttons behind. Each had a brace of pistols, and a bright carabine hanging in a bucket on his right side, with a stopper in the muzzle, of red mixed with white, that looked not unlike a tulip; his riding coat, with a scarlet

cape and gilt buttons, was rolled up behind him. The Earl of Kerry's gentleman of the horse single, mounted on a very fine bay horse. The steward, waiting-gentlemen, and other domestics of the Lord Kerry. This cavalcade of the Earl's own family, and all mounted out of his own stable, to the number of thirty-five, being passed, there followed another of the gentlemen of the country, which was very considerable, there being about twenty led horses, with field cloths, attending them. But the day proved very unfavourable, and all this pomp and gallantry of equipage was forced to march under a heavy and continued rain to Listowel, where the High Sheriff had prepared a splendid entertainment, consisting of one hundred and twenty dishes, to solace the judges and gentlemen after their fatigues, which it seems they greatly wanted, for the roads were so heavy and deep, by reason of the excessive rain, that the judges were forced to leave their coach, and betake themselves to their saddle-horses. But their repast was short, for tidings being brought that the River Fayl was swelling apace, they soon mounted, in order to pass over while it was fordable."

In 1768 "Kerry House," in Molesworth street, came into the possession of Anthony Foster, eldest son of John Foster, of Dunleer, appointed in 1765 Chief Baron of the Irish Exchequer, a post which he resigned in 1776; and was succeeded in his house here, on his death in 1778, by his son, John Foster, who was born in 1740, educated at Trinity College, Dublin, elected member for the borough of Dunleer at the age of eighteen, and called to the bar in 1766. In 1768 John Foster was returned as representative for the county of Louth, ten years subsequent to which he was appointed Chairman of the Parliamentary Committee of Supply. Under the predominant English influence, Foster, for a time, opposed Irish Free Trade and Independence; but he subsequently was the author of excellent measures, supporting the corn trade, the linen and cotton manufactures of Ireland. In 1785 he was elected Speaker of the Irish House of Commons, by his curtailment of the gallery, of which he acquired an unpopularity augmented by his opposition to the emancipation of the Catholics, and his violence towards the people in 1798. Foster's energetic opposition to the Union gained him the public favour in 1799, and after the debate in the Commons in January of the latter year, the Lord Mayor, Aldermen, and Common Council of Dublin, went in state to his house in Molesworth street, amidst the acclamations of thousands of spectators, the band playing "Long Live the King," to present him with a complimentary address. On the same day a numerous body of the merchants and traders of the city of Dublin went in procession from the Royal Exchange to Foster's residence, and also presented him with a most respectful address. As a speaker, he was calm and firm, possessing little eloquence, but reasoning with calmness and accuracy. Foster was appointed Chancellor of the Exchequer of Ireland after the retirement of Isaac Corry, and was created Baron Oriel of Collon, county of Louth, in 1821. The Royal Dublin Society possesses a full-length portrait in oil of Foster, whose likeness was engraved in oval by Maguire; also at full length, in the Speaker's robes, by C. Hodges, in 1792, from a painting by C. G. Stuart. Foster's only son, Thomas Henry, Viscount Ferrard, having married Viscountess Massareene, assumed the name of Skeffington, and died in 1843. His eldest son, now Viscount Massereene, enjoys also the titles of Baron of Lough Neagh, Viscount Ferrard, Baron Oriel in the Peerage of Ireland, and Baron Oriel, of Ferrard, in the Peerage of England.

THE CROSS OF TUAM.

By RICHARD J. KELLY, B.L.,
HON. SECRETARY OF THE GALWAY ARCHÆOLOGICAL AND HISTORICAL SOCIETY.

The Cross of Tuam, which stands to-day in our market place, is one of the finest specimens of that particular kind of sculpture in Ireland. Despite the ruthless ravages of time it is to-day in a wonderful condition of preservation, the figures upon its base and shaft being still remarkably well defined.

This Cross was erected in the episcopacy of Aidan O'Hoisin, or Edmund O'Hession, who was Archbishop of Tuam from 1150 to 1161. In the Annals of Innisfallen he is called Æda Va Deisin. He succeeded Bishop O'Duabhai (O'Duffy), and was the first Archbishop of Tuam. He was invested with the Pall at the Synod of Kells, presided over in 1152 by Cardinal Paparo, and seven suffragan Bishoprics in Connaught were assigned to his archiepiscopal see at Tuam, namely, Mayo, Killala, Roscommon, Clonfert, Achonry, Cluan, and Duach. Mayo afterwards was united to Tuam, as was the See of Enaghdune, or Annadown, which it does not appear was originally assigned. Roscommon was afterwards "translated" to Elphin, and Cluan, or Clonmacnois, was annexed to Armagh after a long litigation over its possession, carried on by suit in the ecclesiastical court of Rome between the Archbishops of Armagh and Tuam. Archbishop O'Hoisin convened a Synod at Roscommon in 1158, and at this assembly many good canons and disciplinary regulations were made. He died in 1161, and was buried in his own Cathedral in Tuam under a monument on which (according to an old writer) was inscribed in Irish an epitaph describing him as the comarbain, or successor, of St. Jarlath. "Our historians," says an old chronicler, "have not been backward in celebrating the fame of his piety, learning, and liberality." The same year in which he died Roderick O'Connor, King of Connaught, built a castle of stone at Tuam, which, "as a thing new and uncommon among the Irish at that time, grew famous by the name of the wonderful castle." Catholicus, or Cadla O'Dubhai (Duffy) succeeded Archbishop O'Hoisin (Hession). He was "a man of weight, and learned according to those times." The Annals of Leinster tell of a great Synod held in Tuam in 1172 by this Archbishop, when he consecrated three churches there. It was principally through this Archbishop's instrumentality that King Roderick O'Connor of Ireland and King Henry II. of England came to terms in 1175. The Archbishop, along with Cantbred, Abbot of St Brendan, and Lawrence, Chancellor of Roderick, went to Windsor as the Irish plenipotentiaries and concluded the first treaty ever come to between an Irish and an English King, which, of course, was broken when it suited the English convenience, but observed with what proved fatal fidelity by the Irish. Dr. O'Duffy attended the Lateran Council, and on his way to Rome through England he and the other Irish Bishops had to take an oath not to do any hurt to the English King's interests and rights in Ireland. Dying in 1201, after being Archbishop for forty years, he was buried in the Augustinian Friary of St. Fechlin at Cong. During his pontificate Tuam was destroyed by fire.

The inscription on the base of the Cross has been deciphered to read thus;—

ORDO U OSSIN; DOND
A BBAID; LA (SA) N DERN (A.D.).

This line has been translated to mean:—

Pray for O'Hoisin by whom was made.

On the other side of the square base runs this line:—

OR DO THOIRDEL
BUCHUCHONCHOB
UIRDONT . . . UR . . . 1
ARLAH (F) SINE (F) (N)
ADINSAER.

This, with the obvious literal omissions and gaps filled in, has been translated thus:—

"Pray for Turlough O'Conor for the . . . . of Jarlath by whom was made this:

The inscribed figures represent the Crucifixion on one side, a figure of a Bishop with his crozier on the other; a funeral procession apparently on the reverse.

The sculptured and inscribed stone of Christian Ireland are generally (so far as they are known) divided into the following groups, viz.—200 Og ham stones, 250 tombstones, 7 pillar stones, 4 altar stones, 1 Mass stone, 1 quern stone, and 45 high crosses. Tuam belongs to the latter class, and, as the inscription on the Kill-na-saggart cross states that Ciaran bequeathed a place under the protection of St. Peter which was marked by this stone, and the inscriptions on the Tuam, Kells, and Clonmacnois crosses show that these were commemorative. They all date from the tenth to the thirteenth centuries. As Archbishop O'Hoisin died in Tuam in 1161 and occupied the See of St. Jarlath from 1150, we may fairly put the date of the cross as between those two terminal dates—say, 1140. It is, therefore, at least 760 years since it was carved and erected, and its present fairly good condition despite the neglected way it was allowed to remain for years, shows how well those men carved in those days—evidently meaning their splendid work to last for all time as it seems destined to. The winds and rains and frosts of nearly eight centuries have dashed against it, and still it stands in a wonderful state of preservation. Many years ago it was knocked down and broken up. The shaft was carried to the Protestant churchyard, and there it lay unminded and uncared for over the grave of the Burtons, at the west side of the church. The base was taken up to the Cathedral grounds by the Catholics, and it stood on the very spot where now stands the beautiful statue of the late Archbishop M'Hale. It was there for some forty years when, about the year 1870, the late Bishop Bernard generously consenting to the removal, the parts of the separated cross were once again joined and it was erected in the Square of the town. A part of the shaft was found in Mr. Burton's old house in the Mall, and a section yet remains

missing, the defect in some degree marring the beauty of its appearance and symmetry. It probably is hidden away under ground, perhaps over some grave, as was the other part, or built into some house a chimney piece (as one of the restored portions was), or a lintel of a door plastered and mortared over. It is a thousand pities that it cannot be found, for the completed cross, as may be seen by the model standing to-day in the National Museum in Kildare street, Dublin, and which was at the great Exhibition in London in 1855, would be a most beautiful and imposing monument. Even as it is it is a credit to the artistic genius of our ancestors and an ornament to this historic and ancient town.

ON REVISITING—IN THE COUNTY MEATH.

BY Z. Y.

So the river mirrors the castle walls,
Just as it ever did!
Half seen, half ivy-hid,
And there they are, those old ruined halls
As haughtily facing the autumn blast,
And wearing as royal an air,
And looking as jealous of glory past,
As I knew them in days that were.

The lightning, and time, and the wild-night wind,
All then have passed them by,
And left their green towers still dark out-lined
On the blue and quiet sky!
They have scorned to bow to the storms' strong grasp,
Which hath hurled things down more frail:
Scarce a grey stone stirred from the moss-wreath's clasp,
At its whistling and dirge-like wail.

And like silver sparkling in the sun,
The bright river rolls on yet;
And gem-like its graceful sweep upon
The grassy isle is set;
And in emerald freshness the still banks lie:
Oh! I remember all;
How such things live while young hopes die,
And air-built castles fall!

The names too engraven here years ago
On the young tree's sun-gilt bark,
Now in the crims'ning evening's glow,
A memory-saddening mark;
I meet them as I roam along
O'er the yellow rustling leaves,
And thoughts, how many! o'er me throng
Of other autumn eves.

A PLETHORA OF MOONS.

The characteristics of Dogberry and his fellows—types of dull and self-satisfied humanity—are not likely to perish, even in our day of progress and enlightenment. Their characteristics, as as especially manifested in their office, seem to belong some centuries back, yet the last of the old men who remember the comic rural watchmen of England—the "Charleys" they were often called—are but now dying out; and many absurdities of the watch are preserved in comparatively recent tradition.

It used to be customary to place upon the watchmen so aged that any rascal could run from them, or any naughty lad trip them up; while it was a favourite amusement of wild and mischievous young men to tip over the sentry boxes in which they took refuge during inclement weather, and be off and away before the unfortunate officials could extricate themselves or get so much as a glimpse of their assailants. Their wits were as sluggish as their limbs, and a truly Shakespearian anecdote is told of the preambulating guardian of a historic town.

It was part of his duty to call the hour and the weather. There had been a sharp shower, then clearing winds and moonlight, with, naturally, many glistening reflections in the pools of rain that still lay upon the ground. The old watchman plodded faithfully through street after street, calling aloud, to the amazement of all wakeful folk, who heard:

"Past 11 o'clock, a wet night, and more moons than usual!"

AN OLD WATERFORD KEEP AND ITS MEMORIES.

THE POWERS OF DON ISLE.

About three miles outside of Tramore, the well-known, charming watering-place in the county of Waterford, amongst impressive and romantic scenery, stands the fine old "keep" called Don Isle. It is discernable at a considerable distance, the rock on which it is built being almost detached from the range of hills which form one side of a ravine through which flows a beauteous river. It was once the stronghold of De la Poer, from whom the present Marquis of Waterford is descended.

In Ryland's "History of Waterford" it is thus described:—"The Castle might be considered inaccessible on two sides, and where it was liable to be approached, its defences appear to have possessed a considerable degree of strength. The only vulnerable part was well defended by a strong wall and deep fosse, which enclosed a court yard of about fifty yards square. The mason work of the wall can still be traced through its whole course. After entering the courtyard the passage to the Castle was ascended by a steep flight of stone steps, which led to a gate defended by a portcullis, the arch of the gate and the grove of the portcullis being still discernable. You then enter a small courtyard, which appears to have contained several out-offices belonging to the Castle, and then, turning to the left, into a still smaller enclosure of about twelve feet square, the door of the Castle is at length seen. All the various approaches already mentioned are carefully defended by loopholes and embrasures, and on entering the Castle itself the usual square trap-door is observed over the passage, which gave the last opportunity of defence to the beseiged, and from which, in the obstinacy of despair, they poured down on the assailants large stones, boiling water, or other means of annoyance which the danger might suggest. The walls of the Castle are still perfectly upright, not having yielded in the least to the encroachments of time; the Castle, however, evidently suffered considerably from the violence of man, having been subjected to the force of gunpowder; but the square tower which crowns the summit, and which can only be ascended by a ladder, the stairs having been designedly destroyed, is as perfect as if erected within these few years. The church, which lies at the distance of about 300 yards west of the Castle, and which was evidently attached to that building, appears to have been subjected to the same barbarous violence, as the rocky firmness of the masses which formerly composed it, and which now lie scattered in various directions, clearly prove. In one case, an entire staircase remains perfect, but the wall in which it was built has been thrown a considerable distance from its original position. The only part of the wall which remains perfect is the arch which separated the chancel from the aisle. On digging among the ruins of this church some years ago, a statue, cut in sandstone, and bearing on its head a coronet, was discovered; it is now to be seen set upright against the wall at the west end of the church."

It will thus be seen that we have here a splendid specimen of an Anglo-Norman keep, dating from about the 12th century. The family that possessed this ancient castle were amongst the earliest Anglo-Norman settlers, and were the ancestors of the Powers of Waterford. Amongst the most ancient of the feudal Peers of Ireland was Le Poer, who, in almost every writ from the Crown, had the addition of Baron of Donoil (or Dunhill, according to the present orthography) attached to his name. Sir John le Poer, son of Piers of Don Isle, was Sheriff of Waterford in 1304. On the Close Roll of the third of Edward II. is a summons to Parliament, and amongst the magnates summoned is John de la Poer de Donyle. On Candlemas Day, 1310, John Bonneral was killed by Lord Arnold Poer and his accomplices, and the year following, at a Parliament held at Kildare, his lordship was tried and acquitted of this murder, it being proved that it had been done in his own defence. In 1323 we find this same Lord Arnold was Seneshal of Kilkenny, and, we presume, a not very obedient son of the Church, for he was brought before the Bishop of Ossory on a charge of heresy and sorcery. Peter, eldest son of John, Baron of Don Isle, married Joan, daughter of Sir John Wogan, and had a son named John, who died in 1328; and in April of the same year it is stated that Peter Le Poer, son to the Baron of Don Isle, was slain by the followers of Lord Maurice FitzThomas. Sir Arnold le Poer, Baron of Don Isle, is mentioned by Holinshed as one of the four powerful noblemen of Ireland who levied an army of 30,000 men to oppose Edward Bruce in 1317. He died a prisoner in Dublin Castle in 1328. Members of this powerful family were frequently summoned to Parliament, and sometimes proved refractory, as we find by the records of 1346, when John le Poer, Baron Don Isle, had to give security to the Lord Justice Birmingham, at Waterford, for the peaceable behaviour of himself and of all others of his name to the King and his Ministers. These were belligerent times, and faction fights were of constant occurrence amongst chieftains of the period. Maurice Fitzgerald, having received an affront from Lord Arnold le Poer, who, in derision, called him a "Rhimer," assembled all his followers, and, being joined by the Butlers, and Berminghams, slew great numbers of them, and obliged others to retire into Connaught. The Poers were assisted in the broil by the Bourks, but they were everywhere put to flight, and Lord Arnold was compelled to escape to England, leaving his lands to be plundered by the Fitzgeralds.

When Henry VIII. decided to invade France, he ordered an extensive levy of men in Ireland, who were placed under the command of Lord Poer and Sherlock of Waterford. These Irish troops distinguished themselves in France during the war, and it is recorded that when the French were encamped near Bologne, beyond the haven, one of them came forward and challenged any of the English to meet him in single combat. A Waterford man, named Walsh, immediately accepted the offer, and having swam across the harbour, killed his antagonist in fair fight, and returned to his countrymen with the Frenchman's head in his mouth.

Amongst the peers who lost their Parliamentary dignity after the reign of Edward III, and were not subsequently summoned, but were still styled lords and barons down to the reign of Charles II., was Poer, Baron Donhill, or Don Isle, and some others, who in point of antiquity of descent, and of original extent of possessions might vie with many of those peers who preserved their Parliamentary dignity.

On the 15th of August, 1649, Oliver Cromwell landed in Dublin. Drogheda was soon after taken by storm, and Wexford shared the same fate, but at Waterford he met with stern resistance. Owing to the strong walls and fortifications of the city he was obliged to raise the siege and retired in the direction of Dungarvan. At Kilmeadon he attacked a castle of one of the Poers, which he totally destroyed, the lands were parcelled out amongst his soldiers, and Le Poer hanged on the nearest tree.

Curraghmore, the seat of another Poer, submitted to the conqueror, and here, disappointed of his prey, he crossed the country to Don Isle, and perceiving that resistance was meditated, he waited the arrival of reinforcements of foot and artillery. Ryland, in his interesting history of the county, informs us that "the castle, from its insulation and position seemed to defy the threats of the assailants. The noble owner was a female, confident in support of her rights, and sustained in the midst of danger by the courage and spirit of her race. She is represented as Countess of Don Isle: her coroneted tombstone lies in the adjoining burying-ground." It is to be regretted

that no well authenticated account of the siege has been preserved, but there can be no doubt that the castle garrison held out against a fierce storm of shot from the artillery, and was at last compelled to yield to the overwhelming numbers of the enemy. According to tradition the siege was replete with interesting and romantic incidents. Ryland furnishes us with the following, which is credited to the present day:—"It is said that the exertions of the garrison, stimulated by the zeal and courage of the Countess, were for a long time successful in repelling every attack of the savage and infuriated enemy. The Countess was seen in situations of the greatest danger, animating by her presence the almost exhausted spirits of the besieged, and more than sharing the dangers and privations of the meanest soldier. The honour of the vigilant defence is attributed to a gunner, who directed the artillery of the castle, and who next the owner held the principal command. Fortune seemed to favour his exertions. Cromwell, wearied with the length of the contest, was preparing to retreat; he had already drawn off part of his forces, and allowed some repose to the anxiety of the garrison. The Countess had retired to rest without attending sufficiently to the wants and comforts of the heroic gunner, who, the fight being done, breathless and faint, sent to request that suitable refreshment might be prepared for him. A drink of buttermilk was the unromantic return for his exertions, which so irritated his gallant spirit that he made signals to the retreating enemy, and on their reappearance surrendered the castle."

The late Sir Bernard Burke, alluding to the Poers of Don Isle, in his "Extinct Peerages," states that the last of this race was hung at his own castle gate; but this we think is a mistake. It was Poer of Kilmeadon that was hanged by the ruthless conqueror, as we have already shown.

It is pleasing to note that amongst the few restorations of Charles II. in this country was that of Don Isle to John Power, whose descendants are, we believe, in possession of the property to this day.

SEUMAS CORMAC.

BIG SLICE OF A GREAT TREE.

On exhibition at the American Meseum of Natural History will soon be seen the largest section of a tree ever brought from a forest, which is considered the finest specimen of its kind in the world. The fast passing away of the giant redwood trees—due to the axe of the commercial lumbermen—those majestic relics of the forest primeval and the great ice age, is rapidly going on, and it will only be a question of time when all save those standing in the government and State reservation grooves will be destroyed. This huge block of redwood, now skilfully polished, forms a striking big tree exhibit, whose like cannot be seen outside of a visit to Southern California. The diameter is more than 18 feet, and the circumference is 56 feet, and it is surrounded by a fringe of cinnamon-coloured bark a foot deep in some places. The specimen will be the main feature of the new wing of the Forestry Hall. The tree began to grow 550 A.D., and was 13 feet in diameter when Columbus reached the New World, and when cut down it was 1,340 years old. Some of the trees in the same vicinity are said to be from 5,000 to 8,000 years old.

WE GROW OLD IN PIECES.

The general impression is that the body grows old uniformly. From birth till the age of 25 it grows in size and weight, from 25 to 50 it remains stationary, and from that period it decays. Observation of expert physiologists show us that this impression is not a correct one.

Each organ begins to age independently, each has its period for the change, and these periods differ with the various organs and do not take place coincidently, as we may have supposed. The body attains its greatest size during the third decade and remains in about the same condition during the fourth and fifth decades, that is true, but the brain reaches its greatest size in the second decade, the kidneys reach their maximum size during the third decade, the muscles, skeleton, and intestines during the fifth, the heart and lungs in the eighth decade.

Increase or decrease in the size or weight of the body consequently is not due to simultaneous increase or decrease in all its parts.

THE HISTORY AND ANTIQUITIES OF THE CITY OF DUBLIN.

FROM THE EARLIEST ACCOUNTS:

Compiled from Authentick Memoirs, Offices of Record, Manufcript Collections, and other Unexceptionable Vouchers,

By THE LATE WALTER HARRIS, ESQ. WITH AN APPENDIX.

CHAPTER IX.—Continued.

A.D. 851. About this time (Waræi Antiq. cap. 24) the Danes, or Ostmen, again possessed themselves of Dublin, Fingal, and other adjoining territories. And now a bloody battle was fought between the Irish of Meath and Leinster and those foreigners; in which the Danes of Dublin were put to flight, and the city plundered by the victors. A great number of the Danes escaped to their own country, from whence the year following they returned with fresh recruits, overthrew their enemies in battle, and recovered the city of Dublin, which they repaired and strengthened with fortifications. The author of the life of St. Coemgene (Transcriptum ex Codice Kilkennienfii MS. cap. 30), commonly called St. Keivin, intends those Danes or Ostmen, in a passage wherein he speaks of Dublin thus:—"St Garban lived near the city of Ath-Cliath, which is seated in the north parts of Leinster, upon a firth of the sea, and in the Irish language is called 'Dubh-lein,' which in latin signifies 'Nigræ-thermæ,' or the 'black-bath': and the city is potent and war-like, and inhabited by a race of people who have been always most hardy in battle and of great skill in navigation."

A.D. 853. Amlave or Aulaffe (Ware Antiq. cap. 24) arrived in Ireland with a powerful fleet of Danes and Norwegians, and all the Danes then living in Ireland submitted themselves to his government. Some writers (Ibid) have taken this Amlave, and this Norwegian fleet, to be the same of whom Cambrensis (Topogr. Hib. district 3 cap. 43) speaks. "A short time after (says he), namely, after the death of Turgesius, a colony from Norway, and other parts of the islands of the north, as it were the remainder of former swarms, landed in Ireland. They had a competent knowledge of the goodness of the country, either from their own experience or from the reports of their parents. They came not with an hostile fleet, but under a pretext of peace, and colour of traffick; and sitting down in the maritime parts of the kingdom, they at length by consent of the princes of the land erected several cities in it. For the Irish out of a natural disposition to laziness, never in any degree employed themselves in navigation or commerce; and therefore it was by the unanimous advice of the whole kingdom judged to be for the interest of the weal-publick, that some foreigners should be permitted to make settlements in the island, by whose industry the commodities of other countries, which this nation wanted, might be imported into it. The leaders of this enterprise were three brethren, namely, Amelaus, Sytarachus, and Yvorus. They therefore at first founded three cities, namely, Dublin, Waterford, and Limerick; of which the principality of Dublin fell to the share of Amelaus, that of Waterford to Sytarachus, and Limerick became the lot of Yvorus; and from thence by degrees they proceeded to build other cities in Ireland. This people, therefore, who are now stiled Ostmen, were in the beginning peaceable and governable enough under the kings of the country. But when their numbers increased beyond bounds, and they had strongly fortified their cities with trenches and walls, they every now and then were fond of reviving their antient quarrels, which they could not easily forget, and to fly out into open rebellion. They were called Ostmen in their own language, which was a corrupt kind of Saxon, as much as to say, 'eastern men'; for, in respect to Ireland, they came hither from countries lying to the east."

This is the account given by Cambrensis, which others (Ranulph, in Polycronico) have followed; but it seems to be manifest that the Ostmen possessed themselves of these maritime habitations by force and arms, and not under colour of traffic, nor by permission of the Irish; and this will appear, if it be considered, with what barbarity they ravaged Ireland from their first entrance into it, and even at the time of which we now speak, and for a long time after. The account, therefore, of Cambrensis seems to have been blended from actions of two distinct periods. For that these brethren came to Ireland about the time mentioned is certain; but that they landed here under the pretext of traffic (as this writer alleges) is as much a mistake. Nor can it be conceived that Amlave built the city of Dublin after the death of Turgesius, who was slain in 845, when we have seen before (Chap. I.) that it was a city of considerable rank many centuries earlier: and Hollingshed, or those (Stanihurst's Descrip. of Ireland in Hollingsh. p. 20) whose works he published, is in as great an error, when he places the arrival of these brethren in 155. The history, therefore, of the arrival of the Ostmen in the way of traffic should with much more probability be carried up to earlier times, and their coming hither in an hostile manner be placed in the 9th century; and then their building the arches or vaults under Christ-church before the time of St. Patrick (a fact much controverted) (Ogyg. p. 42) may stand with truth.

A.D. 856. A truce which was made in

853 between Aulaffe and some of the Irish princes expiring this year, new hostilities were commenced between Melaghlin, king of Ireland, and the Ostmen of Dublin, headed by the said Aulaffe, which continued three years to the loss of great numbers on both sides; but in the year 859 the former truce was renewed between them. In the meantime, other parts of the kingdom were not so quiet; for in 857 Cathol the white, attempting innovations in Munster, was set upon by king Aulaffe from Dublin, and Yvor from Waterford, and put to flight with great loss.

A.D. 862. Upon the death of king Melaghlin this year, Lorcan Mac-Cathol and Cornelius Mac-Dermod aspired (Ogyg. p 42) to the monarchy, and as a step to it found means by their power to divide the kingdom of Meath between them: but Hugh Finliat, the monarch in possession, by the assistance of Aulaffe, king of Dublin, took them both prisoners, and was thereupon universally recognised king of Ireland, the first having his eyes thrust out by king Hugh, and the other drowned at Clonard by Aulaffe.

A.D. 865. The truce being ended, king Hugh raised an army to oppose the Danes, and gave them a total defeat (Keat. part 2, p. 63) at Lough-foile, in which 1,200 of the enemy fell, with most of their principal officers. Encouraged with this success, the king attacked the fortifications and garrisons of the enemy, and beat them out of their fortresses, recovering all the plunder and booty they had deposited in them. Soon after the principal seat of king Aulaffe, built at Clondolchaim, near Dublin, was set on fire by a party of Irish, and consumed, and in the confusion an hundred of the principal Danes were slain. To revenge this affront, Aulaffe, by an ambuscade, surprised a body of two thousand Irish, who were most of them slain, or taken prisoners.

A.D. 869. The foregoing success inspired the Danes with fresh courage. Aulaffe this year (Waræi Antiq. cap. 24) extended his arms northward, and plundered and burned Armagh, having first slain a thousand Irish in battle.

A.D. 870. Aulaffe and his son, Ivar, fitted (Ibid) out a fleet of 200 ships, and sailed over to Britain in aid of their countrymen Hinguar and Hubba; and making a successful expedition, they returned to Dublin the year following, loaded with vast booty and a great number of prisoners. The Ulster annals relate the expedition thus:

"Amlaph and Yvar came to Ath-Cliath out of Albany with 200 ships, and brought them with a great prey of English, Britons and Picts into captivity." But King Aulaffe died soon after his return.

A.D. 871. Yvar Mac-Aulaffe succeeded his father in the government of Dublin, and was a prince of such power that the Irish annals (Ibid) have given him the title of "king of the Normans of all Ireland." During his government of Dublin, Ailell, king of Leinster, was slain by the Danes; and the year following Yvar died.

A.D. 872. Austin Mac-Aulaffe succeeded his deceased brother, Yvar, and in the year 875 made an expedition (Waræi Antiq. cap. 24) into North-Britain, and having routed the Picts there with great slaughter, was upon his return slain by the treachery of some Ostmen, and then Godfrid Mac-Yvar assumed the government of Dublin. Buchanan (Hist. p. 95, edit. 1715), treading in the steps of some of the English historians (Cowper and Grafton), relates, "that in the year 877 the citizens of Dublin, pretending to be aggrieved by the Scots of Galloway, who had rifled some ships of theirs driven by a storm on that coast, in revenge sent over some forces, preyed the country, and carried home great booty. That Gregory, king of Scotland, to repair the injuries done to his subjects, passed with an army into Ireland, the king of which was then Duncan, Donat, or rather Dunach, who was a child, and under the guardianship of two powerful chieftains, Brien and Cornelius, between whom the whole land was divided into factions. But receiving an account of the landing of a foreign enemy, they made a truce, and marching with two armies, fortified the passes of the river Bann, and by wasting the country, endeavoured to stop the progress of king Gregory. But he marched forward without delay, and by night secretly sent a party of his army to possess an eminence which hung over Brien's camp, which he the next day assaulted, and by tumbling down rocks from his advantageous post, cast the whole army into confusion; Brien was slain, and Cornelius soon after put to flight. King Gregory marched forward, took in Dundalk (called Dungardus by Buchanan) and Drogheda, and laid siege to Dublin, which was surrendered in a short time by Cormal, Bishop of it. Gregory visited his kinsman, king Duncan, and told him that it was not for the sake of conquest or wealth, but to vindicate his subjects, that he came there. Then committing the care of the king's education to the elders of the land, he took upon himself the guardianship, and garrisoning the fortress, he exacted an oath from the nobles that they would admit neither English, Briton, nor Dane into the island, without his licence, and, having taken sixty hostages returned home to his great honour." Hollingshed (History of Scotland, p. 143) embellishes this story with many new circumstances. But, after all, the relation can by no means consist with truth. For the Irish historians acknowledge no monarch of the names mentioned at or about this period; nor was it ever known that a child was admitted to the supreme government of Ireland; and further, the city of Dublin never was the seat of supreme government during the Irish times, nor was it at this time under the power of any Irish king, either provincial or other, but was governed by Godfrid Mac-Yvor, a Dane, and was the head of the settlements of that people.

A.D. 885. Flan Mac-Melaghlin, king of Ireland, was routed (Annals of the four Masters) in battle by Godfrid Mac-Yvor, and his subjects, the Ostmen of Dublin, in which Largisius, bishop of Kildare, and many others were slain; and two years after Kildare was wasted and burnt down by the same people.

A.D. 888. King Flan renewed the war (Ware ibid), which was followed by a fierce battle fought between him and the Danes of Dublin, wherein many fell on both sides; and among others, on the part of Flan, Hugh O'Connor, king of Connaught, was slain; soon after which Godfrid Mac-Yvor, prince of the Danes of Dublin, fell by the treachery of his brother Sitrick, who succeeded him.

A.D. 890. The Danes of Dublin (Trias Thaum. p. 296), under the conduct of Gluniarm, general to Sitrick Mac-Yvor, marched northwards, and possessed themselves of Armagh, and not only plundered it, but set fire to the cathedral, and other religious houses, and carried away seven hundred and ten prisoners into captivity.

A.D. 892. The whole city of Dublin was this year torn (Ware Antiq. cap. 24) by intestine factions, fomented by Jeffery Merlys, a man of great reputation among the citizens at that time, against Sitrick Mac-Yvor, then king of Dublin, on the score of the murder of his brother, and other cruelties, and many mischiefs ensued these dissensions.

A.D. 895. The Ostmen of Dublin marched (Ibid) an army into Ulster, and plundered Armagh; and another party of them the same year (Annals of the four Masters) pillaged Kildare.

A.D. 896. Divine vengeance (Waræi Antiq. cap. 24), though slow, pursued the guilty Sitrick, who had murdered his brother as before said, and he was slain by his own people. He was succeeded by another brother, called Aulaffe Mac-Yvor, who was slain the same year in battle by the Utonians of Tyrconnell, and was succeeded by Reginald Mac-Yvor, probably another brother of Sitrick.

A.D. 897. Ireland at this time felt another scourge besides that of the Danes. For Caradocus of Lhancarvan relates, "That in the year 897 it was destroyed by strange worms, having two teeth, which consumed all that was green in the land. These (proceeds he) seem to have been locusts, a rare plague in those countries, but often seen in Africa, Italy, and other hot regions." Other writers (Polycron. ad. An. 897. Hamm. Chron p. 88) add, "That these devourers left neither corn nor grass, nor food for man or beast, but consumed all that was green in the land," so that of consequence a miserable famine ensued. This visitation confined both the Irish princes and the Danes within the terms of peace for five years, when in the year 902 (Ware Antiq. an. 902) a fresh fleet of these latter people landed on the coasts of Leinster near that city, and put to flight with great slaughter.

A.D. 911. The Danes of Dublin (Carad. of Lhancar. van. ad an. 911) fitted out a fleet this year, and made incursions into South Wales; but were constrained by the inhabitants to return home after a successless expedition, and not without some loss.

(To be Continued.)

LITERARY NOTES.

In "Scribner's Magazine" for May Mr. Henry Van Dyke has achieved a poem of sixty-one lines, addressed to Victor Hugo, without a single full stop.

✧ ✧ ✧

It may not be generally known that each year the catalogue of the Royal Academy has a motto upon its title page. This year it is from Theophile Gautier, and runs: "Rien n'est use pour le genie."

✧ ✧ ✧

An interviewer in the "Sketch" tells us that Mr T. P. O'Connor writes directly on his typewriter—"He goes at a very rapid rate, for his ideas flow in a continuous stream, and he never has to pause for a word in which to express the exact phase of his thought." We are further told that "the only writing which Mr. O'Connor does with his pen, apart from signing his name, is the famous review of 'The Book of the Week.'" We are inclined to congratulate Mr. O'Connor.

✧ ✧ ✧

Mr. George Allen has in preparation a new and complete "Library Edition" of Ruskin's works. The issue is to be under the editorship of Mr. E. T. Cook, and it is proposed to print, probably in the form of notes, any unpublished passages which may be found in the original MSS. The edition will be limited to 2,000 copies for England and America, and the first volume will be issued early in 1903. The price is fixed at one guinea per volume, and the set is to consist of thirty volumes.

✧ ✧ ✧

There are unusually few literary pictures in the Royal Academy this year. Mr. Frank Dicksee has attempted to realise Keats's "La Belle Dame Sans Merci," a subject which seems to have a permanent attraction for artists, and Mr. J. D. Penrose's "The Last Chapter" aims at representing the following passage from St. Cuthbert: "The venerable Bede spent the last day of his life dictating his translation of the last chapter of St. John's Gospel. In the evening the scribe said, 'Dear master, there is yet one sentence to write.' He answered, 'Write quickly.' Presently the youth said, 'Now it is finished.' He replied, 'Thou hast said the truth; it is finished.'"

✧ ✧ ✧

A correspondent of a contemporary writes—Respecting the derivation of "nap," your correspondent quotes the line from "Hudibras":

"I took thee napping, unprepared."

It may be of interest to point out that the word, three centuries before Butler's time, was used by William Langland, in his "Piers Plowman's Vision." A contemporary of the latter, Chaucer, in "The Manciples Prologue" also says:

"A thefe him might full lightly rob and bind,
See how he nappeth."

Our familiar figure "caught napping" was employed before Butler's time by Beaumont and Fletcher in one of their plays, thus:

"You are taken napping now."

✧ ✧ ✧

The murder of Paul Leicester Ford, the distinguished American writer, by his brother Malcolm, acquires its last touch of repulsiveness by the fact that the murdered man was a dwarf, hardly more than four feet high. Literature was his passion almost from infancy, and by incessant practice, aided by a fine instinct, he developed into a very capable and entertaining writer. His novel, "The Honourable Peter Sterling," is quite the cleverest and most faithful picture of New York politics that has yet been given to us. He showed, too, a talent for short stories of a really high order, and was the author of many original and pointed essays on literary and historical subjects. Few Americans knew more about the early ages of his own country, and in "Janice Meredith" and "The True George Washington" he turned his knowledge to admirable account. Popularity and success came to him early and abundantly, and those who knew him would have found it hard to think that even failure could have spoiled his cheerful temperament or destroyed the wonderful poise of his character.

✧ ✧ ✧

Mr. Edmund Gosse, in a fresh and interesting article in the "Cosmopolitan," discusses the fame of Victor Hugo, its area and the likelihood of its performance. About 1880 and for some years, no praise of Victor Hugo could be too unstinted. Twenty years have cooled this enthusiasm, until "a good many very rude things about the divine Hugo are now openly said in the coteries of Paris," although Mr. Gosse only once heard "an ineffable young ass" declare that he was "hardly a poet."

But, at the very lowest estimate, Victor Hugo presents us with the case of a poet who ruled a vast and complex modern nation, without a pretender to share his dignity, through nearly the whole of a period of a hundred years. This is unique, or paralleled only and partially by the almost royal state of Goethe.

Among Victor Hugo's detractors Mr. Gosse will not be numbered. But he finds it profitable to inquire why "his influence has been so very slight and accidental in English and American literature." With the exception of Swinburne, "in a sort of magnificent isolation," Victor Hugo has influenced no English or American author.

✧ ✧ ✧

In the course of an article in "Pearson's Magazine," Mr. T. P. O'Connor sketches with a critical hand the career of Lord Salisbury. Mr. O'Connor dwells with most pleasure on the time when Lord Robert Cecil, a poor younger son of twenty-six, married a judge's daughter (a mesalliance in those days), and became poorer still, was befriended by the now forgotten Beresford Hope, and became a regular contributor to the brilliant and high-paying "Saturday Review":—

"Here it was that Lord Salisbury learned that art of sardonic phrase-making which has been at once his bane and his glory in political life. Here it was that he nourished that hatred and contempt for Disraeli which was the badge of his young school of ecclesiastical Tories; and here it was, above all things, that he learned the art of rapid work, and especially of rapid writing, which also has been a two-edged sword to him in his official career."

At Hatfield he seems the least occupied person about, the reason for which, Mr. O'Connor thinks, is that he writes his official despatches with the facility of the practised journalist with the printer's devil at his elbow.

✧ ✧ ✧

Mr. Ben Greet has just presented to the School Board his report on the examinations in the "Dramatic Literature Competitions" inaugurated three years ago by the Rev. Stewart Headlam. These competitions are confined to scholars attending evening continuation schools and have been attended with remarkable success. This year thirteen schools entered for the competition, and the test piece for recitation was a passage from Act IV., Scene 3, of "A Winter's Tale." In his report Mr. Greet assigns premier position to Fossdene road school, Old Charlton, but, he adds, that as this school has won the prize twice already, he thinks, and Mr. Headlam agrees, that they should be asked to relinquish the award. Something, however, should be given, and Mr. Greet suggests that the teacher of the school should be the recipient. At the close of his report Mr. Greet says:—"I consider, on the whole, there was great improvement all round on previous contests. I consider that each school had good points, and if I mention some particularly it is because there was more to be said of them. The employment of singers and musicians was an excellent move, and showed how very well these branches of the useful arts are being encouraged among evening continuation students."

✧ ✧ ✧

Bret Harte's literary production was astonishingly steady. Over forty volumes stand to his credit, some of which, however, were somewhat slender. His latest volume, "On the Old Trail," contains nine short stories, most of them dealing with his own subjects. We understand (says the "Heading"), that Bret Harte had practically completed a new series of Condensed Novels—the first appeared in 1867—so that we shall have a posthumous work from his pen. Messrs Chatto and Windus will publish the volume, but it may be delayed until the autumn. Amongst the authors parodied are Mr Kipling, Mr Anthony Hope, and Mr Conan Doyle.

✧ ✧ ✧

In an article entitled "My First Book," which appeared in the "Idler" some years ago, Bret Harte explained that his first book was not strictly his own, but a "small compilation of Californian poems indited by other hands. . . . ." The difficulties attending his editorial work are described with characteristic humour. Here is what a reviewer of the Red Dog "Jay Hawk," none of whose verse was included in the Anthology, is reported by Bret Harte to have written of it:—

> The hogwash and "purp" stuff ladled out from the slop bucket of Messrs. —— and Co., of 'Frisco, by some lop-eared Eastern apprentice, and called "A Compilation of Californian Verse," might be passed over, so far as criticism goes. A club in the hands of any able-bodied citizen of Red Dog and a steamboat ticket to the Bay, cheerfully contributed from this office, would be all-sufficient. But when an imported greenhorn dares to call his flapdoodle mixture "Californian," it is an insult to the State that has produced the gifted "Yellow Hammer," whose lofty flights have from time to time dazzled our readers in the columns of the "Jay Hawk." That this complacent editorial jackass, browsing among the dock and thistles which he has served up in this volume, should make no allusion to California's greatest bard, is rather a confession of his idiocy than a slur upon the genius of our esteemed contributor.

✧ ✧ ✧

The most striking instance (writes Mr. W. E. Garrett Fisher in the columns of a contemporary) of the folly of trying to read autobiography into a novelist's writings is afforded by Mr. Percy Fitzgerald, who recently published an article on Dickens, in which he tried to apply the story of the two sisters in "The Battle of Life" to the history of Dickens's marriage. Mr. Fitzgerald, with an inaccuracy which is simply unforgivable in one who has always talked so loudly about his allegiance to Dickens, assumed that Dickens was really in love with the elder Miss Hogarth and then married her younger sister, and on this totally erroneous foundation built up a fabric of assumption, with the help of the hypothetical autobiography embedded in "The Battle of Life." The blunder would be ludicrous if it were not of a nature to give considerable pain to the surviving members of the Dickens family, one of whom has sent a strong and well-deserved protest to the current number of "Harper's Magazine," in which the peccant article was originally published. He speaks with justifiable severity of the extraordinary way in which "Mr. Fitzgerald has woven a wild and fantastic legend, based upon an absolutely erroneous statement of the facts." Of course, there is no ground at all for Mr. Fitzgerald's theory of a deep romantic mystery attaching to Dickens's affection for Mary Hogarth, and it is only the desire to air his own cleverness in perceiving the "real foundation" of "The Battle of Life" that led him into a blunder so ridiculous. And yet, with all these modern instances before their eyes, people continue gaily to extract "autobiographical revelations" from Shakespeare's Sonnets!

SCIENTIFIC TOPICS.

It is announced that Siemens and Halske, the owners of the Braun patents, have signed a contract with the Austrian Government for the installation of the Braun system of wireless telegraphy on the Adriatic coast.

✧ ✧ ✧

Dresden boasts of a novel method of heating its Royal Castle, Royal Opera House, and Police Headquarters. The heat is conveyed through pipes. So great is the distances in some cases that the furnace is known in the town as the "long distance heating apparatus." It might seem that the loss of heat must be enormous, but reports received seem to indicate that the system works admirably.

✧ ✧ ✧

Examination of the fossils which were brought from the Southern provinces of China has been made under the direction of M. G. Vasseur, Director of the Geological Laboratory of Indo-China. The researches have proved that there are in several parts of the provinces of Yun-nan and Koni-tcheon Devonian schists very rich in fossils.

✧ ✧ ✧

A new species of violet has been discovered by Miss Lillie Angell, of Minton Place, Orange, and Charles Louis Pollard, curator of plants at the Smithsonian Institution, has named the species Viola angellæ, after the discoverer. The leaves are cordate-ovate in outline, with a broad sinus, irregularly five to seven lobed, or some of them merely deeply sinuate. The lobes are all obtuse, more or less crenate, and the flowers are violet-purple, darker at the base. The leaves attain large dimensions.

✧ ✧ ✧

An experiment is now being made by the Chicago and North-Western Railroad on the new Overland express which will be watched with much interest both by railroad men and the public at large. The express in question is equipped with telephones, which connect not only the several cars, but can be connected with local and long distance wires at any station along the line. If this experiment proves successful the company will probably install a service, which will enable passengers to telephone from a moving train.

✧ ✧ ✧

A searching party is to be sent out to hunt up the Baldwin-Zeigler expedition. The steamer "Frithjof," which conveyed the Baldwin party to Franz Josef Land, has been chartered for the purpose. She will leave Tromsoe on July 1, under the command of Captain Kjeldson, her former captain. From Tromsoe the "Frithjof" will go to Camp Zeigler, on Alger Island, 80 degrees 24 minutes north latitude. At this camp Baldwin's last instructions will be secured, after which the auxiliary expedition will proceed northward.

✧ ✧ ✧

The conditions of the races for the capital prize of 100,000 dollars, offered by the St. Louis World's Fair management, have been published. Tentative rules for the time of the races, shape of course, type of airship, and the like have been drawn up. It has been definitely decided that 200,000 dollars shall be appropriated for the contest, to be divided as follows:—100,000 dollars for a grand capital prize; 50,000 dollars to be divided into a number of subsidiary prizes; and 50,000 dollars devoted to the conduct of the competion and the payment of general expenses.

✧ ✧ ✧

Count von Zeppelin, who has the distinction of having built the largest of all airships, has been financially ruined by his aeronautical experiments. Unable to obtain means for carrying out his new projects, he is now breaking up the old framework of his airships in order to sell the aluminium of which they are composed. Zeppelin is sixty-seven years of age. He is something of a historical personage. He was military attache of the German Embassy during the civil war, and made several balloon ascensions from battlefields of the South in 1863. He was the leader of the famous cavalry raid into France in 1870, which marked the commencement of hostilities of the great Franco-Prussian war.

✧ ✧ ✧

The expedition which started last year under the auspices of the British Royal Society, to explore the cave fauna of the Malay Peninsula, has accomplished some very interesting biological work, and many geographical observations have been made which prove existing maps of this country to be erroneous. The expedition has crossed the Peninsula from Singgora to Kedah, and has discovered that the high mountain range marked on maps does not exist in that part. About 120 miles north of Penang the mountains are over 6,000 feet high. The chief object of this scientific expedition is to study tropical cave fauna with a view to ascertaining whether it will throw light on the history and evolution of cave-dwelling animals.

✧ ✧ ✧

The aeronautical problem, which is just now receiving most attention in France, is a voyage across the great desert of Sahara. M. Deburaux considers it absolutely practicable to travel from Tunis to the Niger by means of the winds travelling in that region. He declares himself ready to make the experiment. Up to the present time his ambition has remained unrealised, for the reason that the necessary funds have not been forthcoming. To construct and equip a balloon with a carrying capacity of several passengers, would entail a cost of about 160,000 dollars. For economical reasons the plan has been advocated of sending up an experimental balloon controlled by automatic devices. The expense involved in this undertaking would be only about 4,000 dollars.

✧ ✧ ✧

The equilibrium of this experimental balloon is to be maintained by means of a steel cable weighing half a ton. Ballast in the shape of 5,000 pounds of water is carried in the tank. Automatic means are provided to discharge this ballast when the balloon falls to within 150 feet of the ground. The balloonette, which has figured so prominently in the Santos-Dumont airship, will be used to keep the gas bag in shape, in spite of the leakage of gas. Prof. Deburaux believes that the nomadic tribes of the desert, who might pick up this balloon, would probably convey the information of their find to civilisation. But whether the nomads of the desert are sufficiently imbued with the scientific spirit, is a matter of some doubt. Perhaps a better plan would be to offer a reward for the return of the balloon or of some account of its fate.

✧ ✧ ✧

Dr. E. Ule contributes to Engler's Jahrbuch (30 Beiblatt) some interesting observations on "antgardens" in the Amazon region, where they abound on a large number of woody plants. They are generally spherical in form and about the size of a walnut. They are formed by several species of ant, which appear to collect the seeds of many different plants and to sow them in these nests, covering up the seedlings with humus when they begin to germinate. In the structure of these "ant epiphytes" the foliage and the roots display characters which especially adapt them for the situation in which they grow, and promote also the protection of the ants themselves in their nest. Quite a number of the epiphytes were found by Ule as denizens of the antgardens and nowhere else. Among them were three species of Piperaceæ, five of Bromeliaceae, five of Gesneraceae, one of Moraceae, and one of Cactaceae.

✧ ✧ ✧

An unusually interesting discovery has been made at Stanford Bishop, England. Dr. James Johnson, the eminent antiquarian, has found an old oak chair in the village church, which is said to be the most perfect sample of ancient British carpentry extant. It is believed to have been used by St. Augustine at the synods held between A.D. 590 and 603. The chair is made entirely of oak, without any form of iron work. It is oblong in shape, the outside measurement being 32 inches in length and 22 inches in width. Four massive posts, with two boards on each side mortised into them, forms the supports. The seat is 26 inches in length and 18 inches in width, and appears to have originally been 2 inches in thickness. It is movable like the lid of a box, the hinges being two round tenons inserted into mortise holes in the rear posts. The construction of the chair is similar in many respects to a Roman solium, or chair of authority.

✧ ✧ ✧

A coal field in Asia Minor, situated in the north-east of the peninsula on the North Sea littoral, and about 140 miles from Constantinople, is being worked with some vigour, says "The Engineer." The two principal ports of shipment are Heraclea and Zoungouldak. As a bunkering coal, an independent examination on behalf of the British Admiralty condemns it on account (1) of excessive clinkering, and (2) of a too high percentage of impurities to enable it to be used with advantage where a large amount of coal is required to be used per square foot of firegrate. The quality tried for the British Admiralty contained 15 to 20 per cent. of ash, and other qualities contain as much as 50 and 60 per cent. In some parts of the country no true coal exists, but lignite is found in greater or less quantities. Its heating value, as compared to coal, is as 11 to 14, but it can be burned to advantage as fuel for steam boilers if the grates are made very large and correspondingly deep. There is a difference in the quality of lignite as in all other things, some of it being very wet. The heating surface should be not less than 40 to 1, or about what is used for anthracite. Lignite burns freely, being very light, and requires frequent firing, and for that reason is very apt to be condemned by those who attend to that duty, but it is no worse in this respect than soft coal screenings, of which quantities are used daily.

✧ ✧ ✧

Early in February Mr. Phillips, the U.S. Consul of Cardiff, received a letter from Galveston propounding certain queries as to the likelihood of oil fuel being introduced there. He replied as fully as he could at the time; but he has since made further investigations, and now furnishes the results. The Consul ventures to prognosticate that this new combustible is destined ere long to revolutionise the coal markets of the world. The abnormal cost of steam coal in Great Britain—particularly in Wales—and the exhorbitant price of the best house coal (£1 6s. per ton) are calculated to hasten this revolution. An impetus was given to this industry five years ago, when petroleum discovered in Borneo was found to be well adapted for fuel purposes. This field is owned by the Shell Transport and Trading Company, Limited. Last year (1901) the exports exceeded 100,000 tons. The Dutch Steamship Company uses this fuel in its boats; the Hamburg-American Line has built four new steamers adapted for oil fuel, and run them in the Eastern trade with marked success; the North German Lloyd has two local steamers using oil; the East Asiatic Company, of Copenhagen, employs this fuel in its local boats, and is building two ocean-going steamers with the intention of using it; and the China Mutual is preparing three boats for the employment of oil. The prejudice against oil fuel is passing away. Several firms are contemplating a change in their method of steam production, which they predict will be as safe as the old method and more economical.

GLIMPSES OF THE PAST.

From the Dublin Newspapers of 1793.

DECEMBER 6.

Notwithstanding that the late Coal Act for Dublin gives to the Right Honourable the Lord Mayor a very incompetent share of control over the coal factors, his Lordship's zeal is not less arduous to calm if possible the current of extortion, so rapid and mischievous in this line, and to bring that indispensable necessary of life to a moderate price.

Notwithstanding that a fleet of coal ships, with full cargoes, have lain for three weeks in our harbours, still is the price kept up on the citizens, under the pretence of actual scarcity, owing, as it is alleged, to the difficulty of inducing the sailors of Whitehaven to work the ships over, lest they should be pressed.

To explore this fallacy, the Lord Mayor called a metting of the coal-ship captains, and offered, if they would bring their vessels up to the quays, and sell their coals during the winter months at one guinea per ton, he would apply to Government to have their men protected from being pressed.

His Lordship applied to Captain Brabazon, the regulating navy officer of this port, upon this head, who cheerfully rendered his co-operation in the proposal of his Lordship.

The coal-ship captains declared themselves ready to a man to comply with his Lordship's request; but the coal factors, who had purchased their cargoes, would by no means assent to the coals being brought up to the market, though many of the captains declared they could with readiness clear out their cargoes in four days, or at most in six.

Thus do we see stubborn extortion setting the laws at defiance, wrestling with authority, and daring the Chief Magistrate of our city in the execution of his duty.

Acts of this nefarious kind, by tending to exasperate the people at large, tend directly to a breach of the peace, and deserve to meet the most exemplary punishment.

DUBLIN, DECEMBER 27.

Christmas Eve, Alderman Carleton, as late Lord Mayor, distributed to 304 debtors confined in the different prisons of this city, the annual bounty of a twelvepenny loaf and a piece of beef each. This humane donation arises from a legacy left by a benevolent gentleman of the name of Powel; the expense is defrayed by the interest of £800, at 5 per cent., vested for that purpose, and the persons who have last served the offices of Lord Mayor and High Sheriffs are the almoners.

How good, how bounteous, must have been the mind that could provide a morsel to comfort and sustain the unfortunate, many years after itself should be gone from hence to the enjoyment of eternal happiness! We shall only say to the affluent who would wish to enjoy real luxury, the luxury of doing good—Go and do ye likewise.

DUBLIN CASTLE, DECEMBER 20, 1793.

Letters Patent have been passed under the Great Seal of Ireland, granting the following dignities—viz:—

To the Right Honourable Edmund Viscount Mountgarret the dignity of Earl Kilkenny. To Arthur Visc. Valentia, the dignity of Earl Mountnorris. To Otway Visc. Desart, the dignity of Earl Desart. To Alice Viscountess-Dowager of Wicklow, the dignity of Countess of Wicklow, in the county of Wicklow, and to the heirs male of her body by Ralph, late Lord Viscount Wicklow, the dignity of Earl of Wicklow. To John Viscount Clonmell, the dignity of Earl of Clonmell, of Clonmell. To Andrew-Thomas Lord Castlestewart, the dignity of Viscount Castlestewart. To Robert Lord Leitrim, the dignity of Viscount Leitrim. To Francis Lord Landaff, the dignity of Viscount Landaff. To Cornwallis Lord De Montalt, the dignity of Viscount Howarden. To John Lord Fitz-Gibbon, the dignity of Viscount Fitz-Gibbon.

DUBLIN CASTLE, 28th DECEMBER, 1793.

Letters Patent have been passed under the Great Seal of Ireland, constituting and appointing the Right Honourable Richard Earl of Shannon; Sir John Parnell, Bart.; John Beresford; Sir Henry Cavendish, Bart.; William Conyngham, and Lord Hobart, or the Chief Secretary to the Lord Lieutenant for the time being, to be his Majesty's Commissioners for executing the office of Treasurer of his Majesty's Exchequer of his Majesty's Kingdom of Ireland.

The Right Hon. Theophilus Clements to be his Majesty's Receiver General and Paymaster-General of all his Majesty's Revenues within this Kingdom of Ireland.

The Hon. John Loftus Loftus, to be Teller or Cashier of his Majesty's Exchequer of this Kingdom.

JANUARY 9.

Monday morning the body of an unfortunate female was taken out of the river at Crampton quay. In her pocket the duplicate of a pawned watch, with one sixpence, were found. The body appeared to have lain but a short time in the water.

Mr. Sheriff Jenkins, attended by Mr. Gregg, the gaoler of the New Prison, went on Saturday last, by information, on board a vessel lying at the new Custom House, and apprehended a fellow named John Connor, charged with having committed an atrocious murder some time since in the county Kildare, whom this active magistrate safely lodged in the New Jail.

Yesterday, two persons of the name of M'Cabe and O'Hara, were brought up to town from Balbriggan, by Justice Wilson, under a strong guard, and lodged in the New Prison, charged with being concerned in the atrocious murder of Mr. Pentlant, a revenue officer, in Drogheda, some time ago. These persons, it is said, are butchers.

Sunday morning early, an unfortunate black man, who had worked some time as a labourer at the glass-house on the North Strand, but was recently discharged, was found dead near that factory. The poor man was by many supposed to have died for want.

The following method of preserving the health of soldiers and sailors was recommended by the late learned and ingenious Dr. Hales:—Let them, where they have opportunity, plunge every morning into the salt water. In the Inland parts, where this opportunity is not at hand, let each soldier every morning throw into his bason an ounce of salt, and, after it is dissolved in the water, dip into the bason a coarse towel, and wet his head, his limbs, and all his body over with this salt water, and immediately after put on his clothes, without drying his skin. Bay salt is the best if it can be had. This wonderfully strengthens and braces all the muscular fibres, and covers the skin with a kind of saltish crust, which prevents all feverish infections. This whole process may be executed in three minutes, and effectually embalms and preserves the body from danger for that day.

It may gratify curiosity to know that Hoche, to whom the chief command was given, when the armies of the Rhine and Mozelle joined, who out-generalled both Wurmser and the Duke of Brunswick, and whose letters are so laconic, was formerly one of the French King's postillions, and afterwards a Sergeant in the Guards, the highest rank to which he rose before the Revolution.

16th.—Monday being the quarter day of the Corporation of Barbers, Surgeons, etc., the freedom of that ancient guild was voted in a silver box to the Right Hon. John Foster, Speaker of the House of Commons, as a tribute of gratitude for his zeal and ability in promoting the agricultural and commercial interests of this Kingdom.

Cove of Cork, Wednesday Morning.

Last night the Sphynx frigate brought in a French prize, and the following is the account sent by the prize masters:—

"The French national corvette called La Trompeaure, mounting 18 guns 6 pounders, on a cruise, and carrying 110 men, ten days from Brest, was in search of the French fleet, had taken nothing this cruise, but on her last had captured several merchantmen; she is only three months old, and launched at the National-yard, Brest. The Sphynx had chased a French frigate the night preceding the capture. She informs of the French having ten sail of the line and eight frigates at sea. She is copper-bottomed, and in endeavouring to escape, she hove 6 guns overboard."

JANUARY 17.

On Saturday last a charity sermon was preached in Usher's quay Meeting House, by the Rev. William Wilson, and a collection made for the Female Charity School, amounting to £136 3s. 6d.

DUBLIN CASTLE, 4th JANUARY.

Letters Patent have been passed under the Great Seal of this Kingdom, granting unto the Rev. Peter Carleton, A.M., the Deanery of his Majesty's Cathedral Church of St. Patrick, in the City of Dublin.

10th.—Letters Patent have been passed under the Great Seal of this Kingdom, constituting and appointing Maurice Copinger, William Preston, Charles Osborne, Richard Moore, and William Wynne, Esqrs., to be Commissioners of Appeal.

17th.—The Lord Lieutenant has been pleased to appoint the Right Hon. Sylvester Douglas to be his Excellency's Chief Secretary in the room of the Right Hon. Lord Hobart, who has resigned.

Dublin Penny Journal

A Magazine of Art, Archæology, Literature, and Science.

Vol. I., No. 11.] DUBLIN: SATURDAY, JUNE 14, 1902. [Price One Penny.

THE SALE OF THE MAJOR'S LIBRARY.

CARICATURE FROM THE "IRISH MAGAZINE AND MONTHLY ASYLUM FOR NEGLECTED BIOGRAPHY," 1811.

We give here a reproduction of another of the caricatures with which "Watty" Cox embellished the pages of his extraordinary periodical, the "Irish Magazine and Monthly Asylum for Neglected Biography," 1811.

The Major, the disposal of whose library by public sale was the subject of the cartoon by Watty Cox, which we here reproduce, was, of course, Major Sirr, whose name figures so prominently in the '98 and Union periods. Henry Charles Sirr was born about 1756, became a wine merchant, and in 1796 received the appointment of Town Major of Dublin, in which capacity he rendered important services to the Government, as the seizure of the "Press" newspaper, and the capture of Lord Edward Fitzgerald in 1798, and Robert Emmet in 1803. He was a man of undaunted bravery, overbearing in his manners, and was equally feared and hated by the people at large. Lord Castlereagh thus eulogises him; "The services Major Sirr has rendered to the King's Government since I have been in office are such as to make me feel it an incumbent duty to bear testimony, in the strongest terms, to his merits. . . . He has been constantly employed confidentially by Government on every occasion which called for great personal exertions, discretion, and courage. . . . The metropolis was peculiarly indebted for its tranquility to the unceasing activity of Major Sirr." He latterly held the post of police magistrate. He was a connoisseur in the fine arts. Major Sirr died 11th January, 1841, and was buried in St. Werburgh's churchyard, Dublin, near the vault where rest the remains of Lord Edward FitzGerald, whom he had made prisoner and mortally wounded forty-two years previously. His papers, which contain much valuable information relating to the events of the times in which he lived, are preserved in the Library of Trinity College.

The following is the amusing letterpress by which the caricature was accompanied:—

December the 21st.—This great sale was finally closed for the year, several very scarce and highly appreciated volumes were disposed of at great prices. The bidders were numerous and respectable in the particular line of literature of which the library is exclusively composed. We never remember so many dignified divines at the library any preceding sale. Mr. Murtagh Lacy, late of Lacy's lane, Cowkeeper and Bricklayer, God rest his soul, had two representatives of his house buying up loyal hymn books, treatises against Popery, and riding-house Bon-mots, to be sent down to ABRACCAN. Jacky Triangle, late of Marlborough Green, did not attend during the sale, not having any intention at present of augmenting his collection, as some apprehensions are entertained that

his books will soon come to the hammer. Major Sandys was, for the first time, absent, as he apprehended he might be waylaid by a band of assassins, who are often observed lurking about Mass lane.

Mr. Samuel Coates, of Beresford's Cavalry, late of Rathangan, was "obliged" to be absent also, on the king's affairs, as he was shipped about three weeks since for Botany Bay, where he is to remain during life, for removing a Velice with six hundred pounds in it, martial law not being in force and the person plundered being a loyal man. If this melancholy manner continues, the Major must immediately close his shop for lack of bidders. In the short space of one month, two excellent customers have been put out of the literary market, and this by the operation of the law: one is a bankrupt and the other has been transported. The good times when those poor gentlemen were the Law and Constitution have unhappily passed away, and vulgar passions are gratified at the fall of two pillars that once ornamented and sustained a tottering empire.

The public will be much gratified to know that the Major's misfortune is considerably abated, by the acquisition of two very great amateurs, whose attention to the interests of the library promises to give every due assistance to promote the interests of the establishment. This fortunate acquisition descends in a direct line from Murtagh Lacy, late of Merrion row, Dairy man, to his labours and industry, for he was a good man in his day: the Christian world, particularly the reformed part of it, owe a great deal of acknowledgement. Murtagh's posthumus fame will live as long as the established Church, the Major's memory, or the Irish Magazine, while true piety, eminent villainy, or literary inquiry are objects of public curiosity.

The following books sold at high prices:

Mr. Bloomfield's abridgement of the Statutes, printed at the Mass lane press, with a handsome dedication to Mr. Cassidy of the Inner-temple, Green street. This edition is illuminated, with a curious collection of affadavits, made by the most distinguished professors of Bible hand, from Titus Oates down to Tom Reynolds and Sheeres Armstrong.

A collection of Songs, written for the amusement of the Farming Society, by George Grierson. This volume contains a great fund of entertainment, and is worthy of the attention of Irish gentlemen solicitous for the comforts of their live stock. The Author has a happy talent at description. The picture of an improved pig stye is excellent, and the manner of education for the grunting inhabitants very instructive, dedicated to the Societies for the improvement of the condition of the poor and for distributing Bibles among the Irish.

Essay on the Irish character, and a plan for making Caravats on the shortest notice, by Major "Row de dow," Commissioner for burning cabins in the north-east district.

A statistical survey of Lucan, by Major Sandys, with a correct map, on which is marked the produce of every acre, half acre, rood and perch in the town and vicinity, with the size, number of apartments, and accommodation of every whiskey house, from accurate "drawings" and actual "measurements," made by the assistance of observations had at every hour in the last week of Autumn, by the aid of different "glasses" of the most approved "diameters." His account of the mutton of Lucan is not so accurate as that of the other produce, as the ill-nature of a butcher prevented the Major of trying experiments to his satisfaction. His Eulogium on the house of White, for the spirited proselytising, Protestant spirit of the MAJOR, whose zeal to purge his regiment of Popery has made so much noise, is animated with becoming language and appropriate sentences of ardent loyalty. This charming treaty is dedicated to LUKE, the flying stationer, and ornamented with a likeness of Limerick Luttrell, Esq.

An ingenuous comparison between "Browney's Cow" and "Hevey's Mare," written by Hakwy White. The author labours to show to the loyal reader that both animals were the instruments and agents of rebellion, and attempts to prove from the testimonies of several witnesses that BROWNEY'S Cow was Carnivorous, as she was frequently detected eating orange men; that the absence of NEWELL must be attributed to this Cow, as well as the fate of many other gentlemen in the North of Ireland, who had been out on racking parties, driving the papists to Hell or Connaught, so far back as 1792, and have not yet returned to their respective dwellings. Hawtry thinks Browney's Cow is lurking in his own neighbourhood, waiting for an opportunity to graze on the loyal, and advises a general search by proclamation. He describes her as having but one horn, as the other was lodged in an Ancient Briton at Coolgraney in the fatal meeting of 1798.

Military movements, collected from the Works of Justice D—— and Lord Blayney. The military reader will find some very Original Articles in this treatise, such as every man of judgment would expect from two eminent tacticians such as the noble Lord and brave Justice have shown themselves in the many arduous campaigns they conducted. The Coombe expedition is discussed with all the accuracy such an important subject deserves. The volume is ornamented with a Portrait of the Doctor, giving the word of command from his garret window. Lord Blayney's likeness is also given in Company with Sebastiani, who appears highly delighted at the vast Genius and great talents which the noble Lord displays in the relation of his Campaigns in Ireland.

Mr. Howard, the author of "Kiartan the Icelander," which we review in this issue, has had a unique and gratifying experience. The other day a stranger called on Mr. J. M. Dent, his publisher, and left a bank note for £100 with a slip of paper on which was written—"From an admirer north of the Tweed to the author of 'Kiartan the Icelander.'"

A RACE OF PEOPLE WHO LIVE IN THE SEA.

Thursday Island is one of the most curious and interesting bits of land on the globe. It is the commercial centre of a race of people who live practically in the sea, viz., the pearl divers of the Pacific Ocean. Thursday Island is one of the little group of coral formation lying between Australia and New Guinea. Taken together, the largest of these islands constitute a calendar, with an island for every day of the week, beginning with Sunday Island. Thursday Island commands Torrest Strait. Representatives of nearly all the nations of the Far East may be seen any day along its shores, disporting themselves in the water—Filipinos, Japanese, Chinese, East Indians, Fijians, and Papuans. To the right of the island, running for 1,200 miles down the Australian coast, is a stretch of waving green vegetation, apparently afloat upon the surface of the placid ocean. This is the top of the Great Barrier reef, the most notable coral reef in the world. Throughout its length its banks are lined with pearl oysters. Thursday Island forms the great market for these oysters. About £200,000 worth of shells are raised annually along the reef and on the western coast of Australia. The business of pearl fishing is conducted on the basis of the profit from the oyster shells. The pearls are clear gain, the value varying a great deal. One pearl found in 1890 sold for £2,000; another for £1,500. Pearls worth £20 are quite common. The shells of pearl oysters are of enormous size, measuring frequently eighteen inches across. The oysters lie in the sea fastened to rocks, especially coral rocks, and quite away from sand and dirt. They hang by thread-like filaments, about a dozen in a bunch. The business of the diver is to cut this thread and bring up the oysters. The shells are worth from £100 to £200 a ton for the best; the poorest from £15 to £60 a ton. The natives trade them for merchandise and realise about £15 a ton on the average. Fishing is done in small boats or luggers. Each boat has a pumping apparatus to force air to the divers under water. The smallest boat with apparatus is worth £600. The business is very dangerous. Poisonous fish, sharks, and squid abound. Sharks rarely attack divers, but contribute immensely to their nervousness. Squid exude a quantity of inky black liquid which dangerously clouds the water. Japanese are the best divers. They stay under water longer, dare more, and can be relied upon better than any of the other types. Among the Malay natives women are successful divers. They go down without diving suits, fastening stones to their feet to help them to sink. Natives and divers are not allowed to open the oysters. A careful watch is kept to prevent the theft of gems, under the eye of an experienced foreman. A good operator can open a ton of shells in one day. It is supposed that a grain of sand getting underneath an oyster shell irritates the fish and causes it to exude a carbonate of lime, which gradually coats the obstruction until a pearl is formed. Attempts to obtain pearls artificially by slipping sand or glass under oyster shells have been unsuccessful. The greatest pearl fisheries of the world are in the Indian Ocean. The product there is but one-tenth the amount of former years.

SHADOWS.

By Frances Graham.

When the sun is slowly setting far across the Western Sea,
And the clouds like shadow islands seem to rise,
Then there comes an old-time story in the twilight unto me,
Of a fairyland beyond the western skies.

'Tis the legend of an island, where all lives were young and bright,
And memory could not fill the heart with pain,
Where the sunlight and the moonlight had a keener, purer light,
And tears and sorrow fled—in love's long reign.

But the waves of time rose proudly, and they swept across the shore,
Hid that dreamland with their waters cold and green,
Left us but a dim remembrance of the days that are no more,
Just a shadow of the light that once has been.

THE DRUIDS' ALTARS AND GIANTS' GRAVES.

By F. R. MONTGOMERY HITCHCOCK.

(All Rights Reserved.)

The cromlech or dolmen is one of those interesting remains of the Stone Age that affords the student of the history of the nations a subject for research and speculation. These relics, with others of the same principle—temples, dome-roofed caverns, subterranean passages, huge blocks standing in a ring, are found all over Europe, and not a few can be seen in Ireland. The readers of this journal are doubtless more familiar with them under the names of Druids' altars or giants' graves. "A cromlech," says Wakeman, "when perfect, consists of three or more stones, unhewn, and generally so placed as to form a small enclosure. Over these a larger stone is laid, the whole forming a kind of rude chamber. The position of the table or covering stone is generally sloping; but its degree of inclination does not appear to have been regulated by any design." The name cromlech is not thought to be Irish, for if it had been manufactured on the soil, we should most surely have it preserved in the names of the localities where they are found. The ancient Irish often styled remains of this kind Labby (leaba), which means grave. In O'Brien's dictionary we have the note—"Leaba is the name of several places in Ireland, which are by the common people called Labhaha-na-veana, the monuments of the Fenii or old Irish champions. There is a Labasheeda in Clare, which means Sheedy's grave." In some parts the cromlechs are called by an Irish term signifying the bed of Diarmaid and Grainne, from the legend that Diarmaid ran away with Grainne, the espoused wife of the celebrated Minn Mac Cuhihail (Finn-ma-Cool), and for one year and a day baffled all Finn's efforts to discover them. During his period of flight Diarmaid erected every night a different leaba to shelter Grainne from the wind and rain. This, of course, is legend. But in Cork we have a townland called Labbadermody, Diarmaid's bed.

An even less poetical name than Labby is Griddle. A cromlech on the top of a hill was often called a griddle. In Downpatrick we have a hill called Sleeve-na-griddle, the mountain of the griddle. Finn-Mac-Cool, the injured and enraged lover, had his griddle in a bog near Easky, in Sligo.

A very fine cromlech is in the Howth demesne. It is generally called Aileen's grave. The covering stone is a huge block, and is almost on the ground. At the base of a rocky hill, where stones of great size are to be seen in numbers, the weight of this stone does not strike us so much as other cromlechs, which are found in a neighbourhood completely devoid of similar stones, and which are generally explained as a deposit of the ice age.

But in Antrim there is a much more elaborate monument. It is called Carngranny, or Carn-Greine (Granny's Grave), Granny being a corruption of Grian, which means the sun, which appears in the name Tomgraney, and which has not anything to do with the word grandmother. The monument to this Granny, this sunny-faced woman, "consists," as Bishop Reeves tells us, "of ten large slabs raised on side supporters, like a series of cromlechs, forming steps commencing with the lowest at the north-east, and ascending gradually for the length of forty feet towards the south-west." Such are some of the great stone monuments now generally known as dolmens and cromlechs. We have seen that there is something more substantial than legend connected with them. Who, then, were their builders? Here we may be guided by the fact that no weapon or implement of any kind of metal has been found in the vicinity of any of these remains. Underneath these dolmens human bones have been found in many cases, and in several places urns have been dug up. The extension of the principle of the dolmen may be seen in the stone chambers and passages of New Grange and Dowth. It is not, however, from Ireland, but from Jersey, that the finest specimens of the cromlech hail. Twenty-two yards in circumference, composed of fifty massive stones, averaging seven feet in height, six in breadth, and four in thickness, and situated on the Town Hill, where Fort Regent now stands, it presented an imposing appearance. It was divided into four perfect cells, had the ruins of a fifth, and was approached by a passage through which one had to creep on hands and feet. This way of entrance was very like that which leads into the fine chamber of New Grange, being fifteen feet long and four feet four inches high, and running east and west. This was indeed a colossal cromlech, a miniature Stonehenge. But it has, unfortunately, been removed from the island. There is still a fine specimen in Jersey near Mount Orgeuil Castle. Situated on a rising knoll, it is approached by what seems to have originally been a covered passage, of which the great side-stones alone remain. The roofing stone under which a person may stand erect, is several hundred tons in weight, being fifteen feet in length, ten and a half in breadth, and three and a half in thickness. Supported on five great blocks, it forms a fairly sized chamber, and may have originally been a place of some form of worship or religious function. There are other structures of a similar kind in the Channel Isles. The archaeologist, Dr. Lukis, explored a magnificent cromlech in Guernsey, near l'Ancresse Bay. Like the Irish monument of New Grange, it stands within a somewhat broken and indistinct circle of smaller stones. It is roofed by five gigantic capstones, and has another chamber near its eastern entrance. It is now called Le Temple des Druides—the Druids' Temple. When Dr. Lukes first found it, it was choked with sand, but when clearing had been effected and the sandy layer had been removed, the explorer came upon the bones of animals, oxen and hogs, embedded in a stratun of sand. Below this he came upon the bones of human beings, burnt and unburnt, and underneath all a miniature cromlech, a small capstone on stone props, under which lay a mass of bones and implements, arrowheads, grinding troughs and mullers, hammers and quoits, all of stone. But not one of these was of iron or of any other kind of metal These megalithic fabrics would not, therefore, have been erected by Celts, who used weapons and implements of bronze and iron—a formidable array of which are now on view in the National Museum, Kildare place. Moreover, the Celts were not builders in stone. They lived in houses of wood and shining clay, with which, Tacitus tells us, they produced marvellous artistic effects. Before the Celts came to Ireland the Tuatha-de-Danaans and Firbolgs had lived here. Of these last it is possible that some remains are still to be found. In the caves of the Arran Isles are found skulls and bones belonging to a long-headed, small-boned race of men, somewhat akin in appearance to the Basque inhabitants of the Pyrenees. The Firbolgs, being driven to the extreme west by the better armed and more powerful Aryan invaders, made their last stand in Co. Clare and the Isles of Arran, where some of their descendants may doubtless be seen to this very day. The fort of Angus, a massive circular fort on the West Coast, consisting of great stones laid one upon the other, the heavier being at the bottom and the lighter at the top of the wall, bears the name of the last Iberian king, while the name of "Scots" was borne by the followers of Queen Scotia. This is all we can say of the builders of the cromlechs. It is very possible that this conjecture may be completely wrong. The cromlechs, at all events, belong to a pre-historic age, an age of which history is silent, and of which geology alone can discover traces.

What was the original purpose of these monuments? Here again we must confess ignorance. But it is apparent that they may have served one or other of two purposes. They may have either been constructed as rude altars by barbarian predecessors in honour of the god they ignorantly worshipped or as enduring monuments of the fame of their strong men and their beautiful women. For ancient urns and calcined bones have been found beneath. Passing from one idea to the other, the natives of Erin call them now "Druids' Altars," and now "Giants' Graves." Perhaps both ideas may be harmonised when we remember that the gods of most heathen nations were but deified men and women.

And by what method of leverage were the great cap stones raised into their present position? This is another interesting question to which we can give no definite answer. But conjectures are not wanting.

It has been suggested by the King of Denmark that these massive blocks were worked up over an artificial inclined plane of earthwork. To other antiquarians it has appeared more probable that the smaller stones found in the vicinity of certain of these cromlechs were utilised in this process of lifting. While it has been recently conjectured that the trunks of the trees which abounded in this even and well-wooded island were employed as levenage, and that the small stones found by the sides of the Dolmens had been originally inserted by the workmen under the great block to secure a purchase for their efforts. It is very likely that the original workmen would laugh at these notions, and consider them far-fetched and poetical explanations of their simple but enduring achivements. The great Pyramids of Egypt still remain to bear witness to the great efforts and colossal undertakings of a long buried civilisation. These marvellous structures, whose raised stone—Clogh togha—was a mystery to later races, are a silent but everlasting monument of the brawn and muscle, the affection, and adoration of the earliest generation of Irishmen.

Ancient Boroughs of Ireland

(From Lewis's "Topographical Dictionary of Ireland," 1837.)

ATHY.

Athy, an incorporated market and post-town, in the barony of West Naragh and Rheban, county of Kildare, and province of Leinster, 17¾ miles (S.W. by S.) from Naas, and 32 (S.W.) from Dublin; containing 4,494 inhabitants. This place derives its name from an ancient ford called "Athelehac," or anciently "Athlegar," the "ford towards the west," which led from the territory of Leix to that of Calleagh or Caellan, and near which a great battle was fought between the people of Munster and those of Leix, under Lavisegh Cean Mordha, in the 3rd century. Donogh O'Brien and his forces crossed the river Barrow at this ford, on their retreat from the battle of Clontarf. The town appears to have originated in the foundation of two monasteries, soon after the English invasion; one on the west bank of the Barrow, by Richard de St. Michael, Lord of Rheban, in 1253, for Crouched friars; and the other on the east bank, by the families of Boisle or Boyle and Hogan, some time in the 13th century, for Dominican or Preaching friars. It was frequently exposed to the assaults of the neighbouring septs, especially of the O'Kellys, whose territories, then called Caellan, are included in the modern county of Kildare. In 1308 the town was burnt by the Irish, and in 1315 was plundered by the Scots under Robert Bruce, who gained the battle of Ardscull, in which were killed, on the side of the English, Raymond le Gros and Sir William Prendergast, and on the side of the Scots, Sir Fergus Andressan and Sir Walter Murray, all of whom were buried in the Dominican monastery. In 1422, the Lord Justice of Ireland, considering Athy, from its situation on the Irish frontier, to be one of the keys of the Marches of Kildare, and necessary to be maintained for the defence of those parts, placed it in the custody of a military governor; and about the year 1506, a castle was built on the eastern side of the river, by Gerald, eigth earl of Kildare, for the protection of the town, which being enlarged in 1575, by one of the family of White, has since obtained the name of White's Castle, and in 1648 was held by the Irish under O'Nial, but was taken in 1650 by the Parliamentary forces under Cols. Hewson and Reynolds.

The inhabitants were incorporated in 1613, at the instance of Sir Robert Digby, Knt., by a charter, in which the corporation is entitled "the Sovereign, Bailiffs, Free Burgesses, and Commonalty of the Borough of Athy." The officers of the corporation are a sovereign (who is a justice of the peace), 2 bailiffs, 12 free burgesses, a recorder, and several inferior officers. The sovereign and bailiffs are elected annually, on June 24th, by the sovereign, bailiffs, and burgesses, out of the body of burgesses, and are sworn into office on Sept. 29th; the burgesses are elected for life, out of the body of the freemen; the latter, in recent instances, have been nominated by the sovereign. The governing body consists of the sovereign,

SEAL.

bailiffs, and burgesses: the recorder, treasurer, and inferior officers are appointed either by the sovereign or the governing body. The borough returned to the Irish parliament two members until the Union.

There are several remains of antiquity; but of the ancient monasteries little is left besides a gateway on the Carlow road, which, when seen in connection with the plantations intervening between it and the river, forms a picturesque and interesting feature in the landscape. Near the entrance from the Dublin road is a modern building occupied by two Dominican friars, with a small domestic chapel, near which is the ancient burial-ground of St. Michael's. The remains of White's castle, which is situated close to the bridge, consist only of a massive square and embattled tower, now used as the police barrack. On the western bank of the river stand the remains of Woodstock castle: the date of its erection is unknown, but it is supposed to have been built, about 1290, by a descendant of the Earl of Pembroke, or more probably at a later period by Thomas Fitzgerald, seventh Earl of Kildare, who, on marrying Dorothea, daughter of Anthony O'Moore, of Leix, in 1424, received the manors of Woodstock and Rheban as her dower. The walls are very thick and in moderately good preservation, and the mullioned windows are much admired for the elegance of their execution; a fine arched gateway and part of the outer court yet remain. The castle was taken from the insurgents, in 1642, by the Marquess of Ormonde, who made it a halting-place for his troops; and, in 1647, Owen Roe O'Nial surprised it and put the garrison to the sword, but Lord Inchiquin compelled him soon afterwards to surrender both it and Athy. Rheban castle is on the west bank of the Barrow, above two miles from the town. In the 2nd century, Rheban was one of the inland towns, and is found in Ptolemy's map. The castle was built, or greatly enlarged, in the 13th century, by Richard de St. Michael, when it and an adjoining district named Dunamase were erected into a barony, of which he was created baron. The first English settlers strengthened and repaired this castle, as also the opposite one of Kilberry. Its name was formerly "Raiba" or "Righban," "the habitation of the King," and though now in ruins, its massive walls, mullioned windows, and imposing position, show that it was intended to awe the surrounding country. In 1325, Rheban, Dunamase, and all their dependencies, were taken by O'Moore, whose descendant, Anthony O'Moore, gave it in dower to the Earl of Kildare, through whom it has descended to the Dukes of Leinster. About three miles from the town, on the Dublin road, and in a most commanding position, is a rude but very extensive ancient fortification constructed entirely of earth raised so high as to command all the adjacent country: it is called the Moat of Ardscull, and if not raised on the occasion of the battle, was probably the scene of it; it was enclosed and planted about ten years since by the Duke of Leinster, and is a conspicuous landmark.

(To be Continued.)

THE LOVER'S WISHES.

(From the French of the Chevalier de Chatelain).

I would I were the cloud above,
That screens thee from the noontide ray;
I would I were thine image, love,
To smile on thee at dawn of day!

I would I were that flow'ret blue,
That waves amid thine ebon hair—
Or eke the glass, when thou dost view,
Within its depths, thy features fair!

I would—when slumbers wait on thee,
And sweet each sense in rest enfold—
Thy guardian angel I might be,
Who hovers round on wings of gold!

I would I were a dream, that leaves
No bitter thoughts thy peace to mar—
A dream so sweetly that deceives,
Than duller truth, 'tis better far!

I would I were a gentle dove,
Glad tidings who to thee might bear;
To fan thee with the wings of love,
And nestle in thy flowing hair!

I would I were the radiant spark
Those eyes emit when day doth flee—
Nay; I would be thy shadow dark,
So I might ever follow thee!

I would I were each thing that meets
Thine eyes where'er they rove by chance—
Each passing wish—each flower, whose sweets,
However humble, draw thy glance!

I would I were the lyre, whose chord
Thine ear with rapt'rous thrills could bless;
I would, in short—in one sweet word—
I would that I were—happiness!

"DUCK AND DUCKLINGS."

When a glacier dislodges itself and sails away over the Arctic Ocean, it never travels alone. In the wake of every large one floats a line of smaller companions. The Eskimos call this phenomenon "the duck and ducklings," and any one who has watched the progress of the eider duck followed by her brood will appreciate the aptitude of the name. Strange as it may seem, plants grow and blossom upon these great ice mountains. When a glacier is at rest moss attaches itself to it, protecting the ice beneath, just as sawdust does. After a time the moss decays and forms a soil, in which the seeds of buttercups and dandelions, brought by the wind, take root and flourish. Those who have travelled in Arctic lands say they have found no point yet where the poppy does not bloom during the brief Northern summer.

KNOCKFIERNA.

DISCOVERY OF THE BIRTHPLACE OF FINN M'CUMHAILL

By J. F. LYNCH.

I.

Dr. Joyce ("Irish Names," vol. i., p. 381), says:—"There is a conspicuous isolated hill near Ballingarry, in Limerick, called Knockfierna, a noted fairy haunt. It serves as a weather-glass to the people of the circumjacent plains, who can predict with certainty whether the day will be wet or dry, by the appearance of the summit in the morning; and hence the mountain is called Cnocfirinne, the hill of truth—i.e., of truthful prediction." Keeper hill (Irish Sliabh Coimcalta "mountain of the fosterage") serves as weather-glass to the people of Cahirconlish district, for they say that the day will be wet when Keeper keeps on his nightcap—a cloud of mist on the summit of the mountain; but I do not think that Keeper is named from keeping on his nightcap. Miss Banim ("Here and There Through Ireland," p. 291), says: "To the south-west of St. John's spire, Limerick, a number of hills are clear against the horizon. The first is Tory Hill, so-called from its woods, having been the headquarters of the 'Tories,' or clansmen, who in the penal times lived by raiding on their own forfeited lands. Next to Tory Hill is Knockfierna, the hill of truth, a hill that is the dwelling-place of all the fairies of that part of Munster. The fairies are a remnant of the wonder-working people who inhabited Ireland before the Milesians came. At the top of Knockfierna is a cavern, from which a stone thrown in by a man is pitched up again, covered by blood; but if a young colleen throws down her ball of worsted, it is wound up again, and sent up to her; and if she has the courage to go there on a May morning and cast in her ball, keeping hold of the end and listening well, as the thread comes up again, she will hear the name of her future husband. A moaning sound coming from the cavern, like the sigh of autumn wind, signifies an early death. Knock Fierna, too, is the countryman's weather-glass, for he knows by it in the morning what the weather for the day will be."

Lewis (Ballingarry) says: "On Knockfierna is a conical pile raised on the spot where stood the ancient temple of Stuadhraicin." Fitzgerald ("History of Limerick"), says: "On the summit of Knockfirine is a heap of stones called in Irish Stuadhruicin, or the pinnacle, which was erected on a specula." O'Donovan ("Supplement to O'Reilly"), says: "Cnoc Firinne, a very conspicuous hill in the parish of Ballingarry, county of Limerick, on which is a heap of stones believed to be the monument of Donn Firinne, who is still believed to haunt the hill in the shape of a warlike fairy."

Dr. Joyce quotes the following from Edward Walsh's "O'Donovan's Daughter":—

God grant 'tis no fairy from Knockfierna that woos me;
God grant 'tis not Cleena, the queen, that pursues me;
That my soul, lost and lone, has no witchery wrought her,
While I dream of dark groves and O'Donovan's daughter.

Dr. Joyce says that in the "Dinnshenchas" there is an ancient poetical love story of which Cleena is the heroine, where it is related that she was a foreigner, and that she was drowned in the harbour of Glandore, near Skibbereen. Dr. Joyce here follows O'Donovan ("Annals of Four Masters"). Clidna (Cleena) was drowned in Roscarbery bay, and the celebrated Wave of Clidna broke upon the Strand of Teite. The monuments of Teite and Clidna are still to be seen; the one is a stone circle named Lecht Teite, and the other is a dolmen named Lecht Clidna, and is on a hill now called "America," but the old name is Sidh Duirn Buidhe, or the fairy-hill of Yellow Fist ("Silva Gadelica," p. 201). I shall have more to say later on the Teite and Clidna. The Tonn of Clidna wails no longer, for the sea retreated some hundreds of years ago from the southern coast, but I have been told that the sea is slowly encroaching again upon the land. One of the poems of Egan O'Rahilly is termed Tarngaireacht Dhoinn Fhirinnigh, or "the Prophecy of Donn Firinneach," and the Rev. Patrick S. Dinneen says in note: "Donn was a celebrated Munster fairy, supposed to haunt Cnoc Firinne, near Ballingarry, Co. Tipperary (recte, Co. Limerick). He holds much the same rank in the fairy world as Cliodhna and Aine. He is a kinsman of the Donn, son of Milesius, who is supposed to haunt the sandbanks known as Teach Doinn, and to whom Andrew Curtin made complaint of his grievances." The Donns are mentioned in "Pursuit of Diarmuid and Grainne," and in "Battle of Ventry," but in neither list is Donn Firinne named. It was to Donn Dumach, and not to Donn of Tech Doinn, that Andrew Curtin wrote an address. In Fotha Catha Cnucha (Windish's "Irish Grammar," p. 139), Rairin, daughter of Donn Duma, is said to have been wife of Tadg mac Nuadat, and consequently mother of Murni Muncaim, wife of Cumall, and mother of Finn. The name Donn simply means "brown." The Celts regarded certain colours as sacred, and attributed certain attributes to these colours, and this is the reason why the old roads of Ireland were termed ruadh or red, dubh or black, etc. It appears from "D. P. J.," p. 99, that Belach n Duibhlinni, or road of the Duibhlinn, was named Cladh ruad, or Rughditch, that is, "red trench." In the "Book of Rights," p. 15, it is stated that 'tis prohibited to the King of Leinster to go with a host on Monday across the Bealach Duibhlinne. The Greeks and Romans erected along their roads statues of Hermes, or Mercury, the god of roads and the protector of travellers. These statues, named Hermae, were quadrangular pillars, (a) about the height of the human form, and were held in great reverence by the Athenians. Cæsar does not give the Celtic names of the deities of Gaul, but the names of many are given in Gaulish inscriptions, some of which are quoted by Professor Rhys in his Hibbert Lectures, who also gives the following inscription found at Thornbury, in Yorkshire: Deo qui vias et semitas commentus est, "to the god who has discovered roads and paths."

I have succeeded in obtaining the real name of Donn Firinne, of which I was in quest for a long time. In the "Life of St. Eiltene," it is stated that he built a church at Cluain, situated between the mountain of Crota and the Mountain of Marg. Crota Cliach, "the humps of Clin district, or according to an old legend, "the harps of Cliach," is an old name for the Galtees, and Elton, situated between the Galtees and Knockfierna, has preserved the name of Elteine, and thus it appears that the old name of Knockfierna was Sliabh Mairge, or "Mountain of Marg." In the "Calendar of Oengus," p. 182, the following entry re Eiltene occurs: "My Elteoc (Moelteoc)—i.e., Eiltene of Kinsale, in the South of Ireland." At Kinsale Moelteoc has been corrupted to Multose, and Lewis says that the church at Kinsale, dedicated to St. Multosia, is stated to have been erected by her in the 14th century. St. Multose was not a "her," and he flourished at a very early period.

In the "Bodleian Dinnshenchas," p. 37, Marg is made son of Guiscach, son of Lodan of Luchair, and Sliabh Mairge, now Slieve Margy, in the Queen's County, is stated to have been named from him. Considering what has been already stated concerning Lodan, the connection of Marg with Lodan is of importance.

In the Dinnshenchas of Duiblinn ("Bodleian Dinnshenchas," p. 35), it is stated that Dublin means "pool of Dubh," daughter of Rodubh—that is, Black, daughter of Very Black, and that Dubh was wife of Enna, son of Nos, of the fairy hill of Forcarthian, near Rathcoole (fort of Cumall), according to O'Curry. But Enna had another wife named Aide, daughter of Ochinn, son of Cnucha, from whom was named Castleknock—i.e., Caisleán Cnucha, and of this Aide, Dubh became jealous, and went beside the sea, opposite Ochinn's house and sang a sea-spell, so that Aide and all her family were drowned. Then went forth Mârgine, the servant of Ochoinne, and cast out of his sling a carr clis (sling-stone) like a thunderbolt at Dubh, and so she fell into the pool, and hence Dublinn (Dub's pool), and Ath Liag Margin, or "ford of Margen's Stone"—that is, the stone cast by Margen, and which must, when the Dinnshenches was written, have been standing beside Ath Cliath Duibhlinne. O'Curry ("Lectures," p. 269), says: "The point of the river over which this bridge of hurdles was thrown, was, at this time called Dubhlinn, literally the "Black Pool," but in fact so-called from a lady named Dubh, who had been formerly drowned there; but from this time down it took the name of Dublinn Atha Cliath, or the Black Pool of the Ford of Hurdles; and this ford, I have no doubt, extended from a point at the Dublin side of the river, where the Dothor (or Dodder) falls into the Liffey at Rings-End, to the opposite side, where the Poolbeg Lighthouse now stands."

Margine, or Margin, is an extension of Marg, and it appears from the Dinnshenchas that Ath Liag Mangin was the old name of the ford of Dublin, which was probably at the foot of Dublin hill, where was also most likely the pool of Dubh.

The hill of Knockaine was named Druim Collchoille, or "ridge of the hazel-wood," which was also the old name of Dublin hill. The fords across the rivers flowing beside the two hills were named Ath Cliath, and Marg is connected also with Knockaine as well as with Dublin. In the old poem re Cnoc Aine, given by Mr. S. H. O'Grady in "Silva Gadelica," p. 576, we read: "Five tribes surely dwelt about the hill, and there they got their firewood; the Dilraighe, the Margraighe, the Sibenraighe, the Calraighe, and the Gargraighe were the fifth tribe that were round about the hill; and this is no false utterance, all which turned out to show the Tuath De Danann fight." The tribes of Greece named themselves from their deities, from whom they supposed themselves to be descended; and the same custom appears to have prevailed in ancient Ireland. In the names of the five tribes of Cnocaine, the termination raighe means race, and Margraighe means race of Marg, and so Mang must have been connected at a very old period with Knockaine.

There can be not the least doubt that the Irish Marg is the "King" Mark of Cornwall,

(a). The pillar stones of the old road south of Ludden hill are quadrangular, and the people say that the top of the Buachaill Breige, on Ludden hill, had shape of the human head. On the pillar stones of Hermes the Greeks placed a head of Hermes.

who in the Arthurian legends is often represented in the darkest colours. Cox ("Popular Romances of the Middle Ages," p. 38), says: "In all these narratives, the good and bad King Mark, the kindly Ring and the hard Rinkrank, each deprive the young and beautiful hero of his bride; in each case the maiden is united with her lover, either in life, as Penelope with Odysseus, or in death, as Iole with Heracles, or Kleopatra with Meleagros. Sir Henry Strachey (Morte d'Arthur, xiii.) regards the fact that Mark appears in his more general form in the older romance as evidence that the later romance-writer found in the King's treachery some sort of palliation for what Sir Walter Scott calls the extreme ingratitude and profligacy of the hero. The charge of ingratitude seems but scantily borne out, or rather, even according to Malory's story, it has no foundation at all. The truth is that, if we judge the story from the standard of our human morality, we shall find profligacy everywhere. Tristram pledges his faith to Isolde in Ireland, but when he returns to Cornwall, he and King Mark quarrel not for her, but about the wife of Earl Segwarides (p. 139). Rather it may be said that in the relations of Mark with Isolte, Tristram displays a singular fidelity; but the multiplication of theories is really not needed to explain variations which are common to the myths of the Aryan nations generally. Here, as elsewhere, the method which we have employed makes it quite unnecessary to enter into controversies which can have interest only on the supposition that we are dealing with powers and persons which are in some degree historical. Hence we may leave on one side the conclusion of Mr. Price (Introduction to Wharton's "History of English Poetry," 1824), that Sir Walter Scott had wholly failed to prove any connection between this romance and the Rhymer of Ercildoune." Though Isolte and Tristram are not mentioned in the Irish tales, yet Mark occurs in Marg; and of Meriadok, who plays a prominent part in the romance of Sir Tristram, I shall have somewhat to say, for Meriadok is the Irish Muireadach.

Cahirconlish Rectory.

LINES ADDRESSED TO A LADY.

By Dr. Maginn.

In answer to your last sweet lines,
Where love, and wit, and spirit shines,
I'll try to write a line or two
Upon a nymph so fair as you.
I'll try to write: Lord, what a pity
That such a bard should pen a ditty
On such a theme: for sure the man,
Who dares the matchless worth to scan,
Should claim his lineage from Apollo,
And Helicon's whole fountains swallow.
Castalia's waters, in a sup
The aspiring bard should guzzle up:
And, fuddled thus, with drink poetic,
He should be joyous or pathetic
He should be ready, then, to dash on
Sorrow, or love, or any passion;
Embolden'd by the inspiration—
Try, with the muses, some flirtation,
The pen that should bepraise my duck,
From a wild goose I would not pluck;
But snatch it from an angel's wing,
As fit to write on such a thing—
On such a thing! I'd not say that,
But that the rhyme comes in so pat.
Designed for such a noble strain,
No vulgar ink that pen should stain;
But, nobly daring, I should try
To dip it in the rainbow's dye,
And steal from heaven, the hues, to paint
The beauties of an earthly saint.
But, Lord, my muse is in a stew,
I scarcely know what I shall do;
For, Helicon, you know, my dear,
Is such a long, long way from here.
Rainbows, no doubt, are in the sky,
But, curse it, they are up so high;
And, as for angel's wings—by Gad,
They're things not easy to be had:
So, as you see, I can't succeed,
You must take the intention for the deed.

OUR WEEKLY STORY

THE MYSTERIOUS MASTER

I really ought not to relate this story, I suppose, because the person it chiefly concerns is still living, and is one of the best known men in Europe, but as biographers have a habit of betraying confidence, I think that in this matter I may be forgiven if I anticipate them.

I was poor, my clothes were threadbare, and my stomach was often painfully empty.

While busy copying Durer's "Adoration of the Magi" in the Uffixi in an attempt to grasp its marvellous technical handling and fluency of colouring, three bright-faced English girls, probably tourists, entered the Tribuna. One of them passed behind me to examine my work, then, probably taking me for an Italian because of my peg-top trousers and soft hat, exclaimed quite audibly in English to one of her companions:

"Look, dear! What a frightful daub! The poor fellow is a student, I suppose. But he'll never make an artist, that's certain."

An hour later I was sitting in the attic, high up above the noisy Via Condotti, which served me as a studio and living room, plunged in black despair.

The door opened, and there advanced timidly into the room a strange, ill-dressed, white-haired old man, who, removing his shabby hat, greeted me affably in Italian. His face was thin and wizened, his figure lean and shrivelled, but his eyes were black and full of fire that age had not dimmed. Accompanying him was a young girl of, perhaps, 18, of that rare type, the fair-haired Florentine.

"I trust you will pardon my intrusion," croaked the queer old fellow in a thin, squeaky voice. I noticed you copying in the Tribuna to-day, and it afterwards occurred to me that you might have some pictures for sale. When I returned, however, you had gone, Therefore, I ascertained your address and came here. Have I your pardon?

"Ah," he added, "you have something there. I see!"

"It's a failure," I admitted sadly.

He raised his eyes to mine with an inquiring glance, and then proceeded to criticise my work in a manner that showed him to be no tyro in art.

The young girl with the blue eyes sat also gazing at the picture, but uttering no word. I fancied, however, that she sighed.

"You see my work, I have no talent," I added despondently, when, in answer to his inquiries, I told him my story.

"You mistake," he answered kindly, "You have some talent, but lack the dexterity which makes an artist. That picture there, for instance," and he pointed to the easel, "might be turned into a very credible piece of work with but little effort. If you'll allow me, I'll give you an illustration of what I mean."

To this I made no objection, and a few moments later he was at work with brush and palette painting away with astounding rapidity, while I stood by wondering as the picture grew beneath his hand. By the addition of subtle touches here and there he was completely transforming the work, showing the tinted and throbbing flesh against the warm light ground with a technical execution that bewildered me. I had never seen a man paint like that before.

"Ah," I exclaimed at last, in profound admiration, "the signore is a painter!"

"I have painted," he answered enigmatically, and his lips closed as if he wished to say nothing of himself. "I do buy my own poor work. But you are in need," he said. "Tomorrow take it to Ferroni in the Via Ciazaioli."

"To Ferroni!" I exclaimed. "But he is the greatest and most critical of all the dealers. Surely he will not care for my work?"

"Take it to him and see."

I stood before the easel in the soft, red light of the Italian afterglow, and marvelled at the transformation that had been effected.

Next day, with the canvas under my arm, I entered Ferroni's, not, I must confess, without some trepidation.

When the dealer saw it he grunted:

"The old man has done this! It isn't your own work," he said bluntly, looking at me. "The mysterious master has been at work again. How did he discover you?"

I explained the whole of the circumstances.

"Ah, you are lucky, indeed!" he responded. "This is not the first picture of his that I have had, yet I would know his work amid 10.000 canvases."

"But who is he?" I inquired anxiously. "He refused to tell me his name."

"Nobody knows," responded the dealer.

"He is a master," I declared, admiring the picture.

"Undoubtedly. Such technique is possessed by no other living painter. It is because of that I am able to offer you 1,000 lire for the picture."

A thousand lire! I stood openmouthed.

"It was more than you expected, eh?" he rejoined with a laugh.

Weeks passed, however, until one morning while I was busy he entered accompanied by Filomena. He seemed rather more feeble, and a single glance at the girl, whose sweet face, with the clear blue eyes, was such an exact replica of that exquisite little Madonna of Vandyke in the Pitti Palace, showed that she had sadly changed. Her cheeks lost their roundness, her face was pale, and she was evidently ill.

I sympathised with her, and we fell to talking quite naturally. She was ingenious, frank, and altogether charming.

I told the signore how I had sold the picture to Ferroni, at which he smiled, and then proceeded to quiz and criticise my work, pointing out a defect in foreshortening that I had not before noticed, and indicating the errors with his thin, bony hand

"But you are improving rapidly—piano, si lavore, bene," he said, encouragingly, and after giving some technical instruction, added, "And now let me see what I can make of it."

He threw aside his shabby coat, took up my palette, mixed some colours with great care, and then in silence went to work.

Thus I stood chatting with Filomena. We chatted about the galleries and the antiquities, and I could not refrain from saying:

"Firenze non si muove, se tutta non si doule."

"Ah," she laughed, "that is quite true! Its charm lies in the fact that the vandals have not touched it like so many of our old cities. And you find it pleasant too?"

"I have but little time to see its beauties," I answered. "I work always. Work, work, but with such little result—ah, so very little!"

The old man finished at last and threw down the brushes, saying:

"I think now it will do. Take it to that old rogue, Ferroni, and make him give you 2.000 lire for it. It is worth that, but the old Jew always lies like an epitaph."

I stood before the easel dumbfounded. The effect was perfect. He was indeed the mysterious master. I thanked him, but he waved me aside, declaring it was nothing.

As the old man had suggested, Ferroni gave me 2,000 lire for the picture, and a day or two afterward, having entered Santa Maria Novella with a view to painting the Strozzi chapel as a background, I suddenly encountered Filomena. She was going up to Fiesole to deliver a message for the signore, and, obtaining permission, I accompanied her. How well I remember that sunny afternoon as we strolled about the ancient little town perched high upon its hill, where the women were plaiting their straws; how we gazed down upon the Duomo and the red roofs of Florence, with the Arno winding away like a silver thread to sun-blanched Pisa and the distant sea. I became intoxicated by her marvellous beauty,

for her face was pure as one of Donatello's angels.

Beneath the shadow of the grim old Porta San Galla she halted to take leave of me, and I saw in her manner a firm determination to give me opportunity of finding out where she lived. Somehow I could not open my mouth even to stammer a word of love, although my heart was full of it.

"Addio," she said, stretching forth her slim, white hand.

"Addio, si dice al morti" (adieu one says only to the dead). I protested, taking her hand.

"Then a riverderie," she said, raising her eyes to mine with a strange, sad look, and, turning, continued her way beneath the trees of the Viale.

Time wore on until the fiesta of Natale. On the day following the fete I chanced to be crossing the Piazzi Signorina, the great old square flanked by the Palazzo Vechio and Oreagna's dark old loggia, with its wonderful bronzes and statuary, when, suddenly, a fine carriage, drawn by a grand pair of bays, passed me. In it, sitting alone, was a slight female figure warmly wrapped in rich furs. I glanced quickly after her. No. Surely it could not be Filomena! I laughed bitterly at the suggestion, then, sighing wearily, continued my way.

One night while I sat reading by candlelight my door was opened suddenly, and a man in smart livery stood in the entry.

"The Signor George Maguire?" he inquired.

I rose quickly and took from his hand a letter, which I found to contain an urgent request in Italian that I should accompany the bearer, as the writer wished to see me immediately. It was signed "Il Maestro Mistomoso."

So he knew the title that old Ferroni had given him! The letter was a surprise, but I assumed my frayed coat and lost no time in obeying. Below a brougham awaited me, and, entering it, I was driven across the city and out by the Porta Romana, to one of those beautiful villas with which the hills around Florence are studded. A man servant threw open the door, and, entering, I found myself in a spacious hall filled with palms and flowers, a veritable winter garden.

Suddenly the servant opened a door, and I found myself with the man who had rescued me from starvation.

His face was haggard and anxious, his eyes bore signs of recent tears, and as he advanced and took my hand I felt that he was trembling.

"Signore," I cried, "why what is the meaning of this?"

"Filomena," he sobbed, in a choking voice. "She wished to see you, so I have sent for you."

"She is ill? Tell me the truth quickly," I cried.

"Come," he faltered, "see for yourself." And he led me to a handsome bed chamber, where in the subdued light I distinguished two Sisters of Charity in their big white headdress tenderly watching their patient. Advancing to the bed, I bent until I saw the poor pinched white face, with the wealth of fair hair straying over the pillow. Her eyes were closed, and she seemed to be sleeping, but as the old maestro approached she suddenly raised her eyelids, and her gaze, wandering, fell upon me.

At first she seemed unable to recognise me distinctly, but a moment later she put forth her thin, wasted hand, and I took it tenderly, unable to utter a word for the hot tears which blinded me.

I felt the soft pressure of her fingers and saw that long, wistful look in her pure blue eyes.

"You have come to me at last Piccino!" she whispered softly in her musical Tuscan. "I have waited so long—so very long, my love, my love."

I stood there rooted to the spot.

Then I drooped on my knees to kiss her hand; but, alas! it was only a dead hand that my lips caressed. With that declaration of her love, the love that I had feared to tell her on that well-remembered day when we went up to Fiesole, she had passed peacefully away.

A couple of days later, the day of the Befana, I turned from the Piazza Donatello into the Viale Amedeo and halted before a large house facing the Gheradesca Gardena, the address of which the mysterious master had given me. The house, I found, was a fine, handsome studio, and upon the door was a small brass plate with the single inscription:—

"Cav. Corradini."

Corradini! I stood aghast before the door. I rang and inquired of the black-coated cameriere whether the signor professore was within. In response he led me through the handsome salon, with its long windows—a salon wherein many a reigning sovereign has sat waiting the pleasure of the great master of painting—along a small gallery hung with his works, and entered the large, bare and rather uncomfortable studio.

And there I found the sad-faced maestro misterioso and discovered the truth. The man who had watched me in the Uffizi and who had transformed my wretched pictures, thus rescuing me from absolute penury, was none other than the great Corradini, whose fame was known to the world over and whose wonder pictures commanded the highest price of those of any living artist.

"You must know the truth," he faltered. "The poor child loved you from the first, but she was struck down by that curse of the human race, consumption. Her thoughts were always of you and of your welfare, and on the day before I sent for you she confessed to me her secret. She confessed that she loved you, that she had met you, but that you had not reciprocated her affection. Yet she passed away happily, poor child," he added in tears. "She knew at last you actually loved her."

And we both sat silent, plunged in unutterable grief. He had lost his only daughter. I had lost my only love.

TWILIGHT.

Soft shadows gather in the afternoon:
And as the mellow sunlight wanes and fades,
There comes a grateful stillness.
Twilight falls,
And Nature, in her myriad motherly ways
Invites to peace and quiet.
Oh, how sweet
Is rest, contented rest, when work is done!
No more the burden of the blinding day,
No more the tiring task, the anxious thought,
The hopeless longing and the feverish haste;
No more the greed of praise, the fear of blame;
No more the care, the worry—nay, no more
Of anything that frets—only sweet rest.

How hushed the air; the earth, how strangely still;
But see, there faintly glints a friendly star,
That brighter glows each moment, as 'twould say:
"Fear not the night; I'll bide and watch with thee."

Walter C. Rodman.

LEARNING AND WISDOM.

The learned man is only useful to the learned; the wise man is equally useful to the wise and the simple. The merely learned man has not elevated his mind above that of others; his judgments are not more penetrating, his remarks not more delicate, nor his actions more beautiful than those of others; he merely uses other instruments than his own; his hands are employed in business of which the head sometimes takes little note. It is wholly different with the wise man; he moves far above the common level—he observes everything from a different point of view; in his employments there is always an aim, in his views always freedom, and all with him is above the common level.—Jean Paul Richter.

NOTES AND QUERIES.

SARSFIELD'S DAUGHTER.

Webb's "Compendium of Irish Biography" tells us that Patrick Sarsfield, Earl of Lucan, had one daughter, who married Baron de Neuberg, styled King of Corsica. Is anything known of the issue of this marriage, and what was the history of this Baron, styled "King of Corsica"?—Brigadier.

MILESTONES, CO. DUBLIN.

Can any of your readers refer me to information about the milestones in this county? I have observed at least three different forms and styles; one is narrow, oblong generally set into a wall and marked 'C.D." and a figure. Are these the oldest milestones, and what does "C D" indicate? The second style is triangular, quadilateral or pentagonal. These stand out by themselves and are very strong and bulky. The names of places are cut on them, and the miles, and generally the place from which the measurement is taken appear on one side, and the place to which the next distance is given appear on the other side. The third style is found on the Malahide and Howth roads. It consists of an iron or metal plate let into a slab of stone. Probably this is the most modern of the three. Can the date of any be traced? Was the difference of style merely the eccentricity of the county surveyor of the period? Which give Irish miles?

E. R. M'C. DIX.

(The letters "C.D." obviously stand for County Dublin.—Editor, D.P.J.).

THE WELLINGTON TESTIMONIAL, PHOENIX PARK, DUBLIN.

To the Editor "Dublin Penny Journal."

Dear Sir—An inquiry appears in your issue of 17th ult. from a Mr. Thomas O'Connor, of Belfast, with reference to the above, and which up to the present has not been answered by any of your correspondents. The following description, taken from Wright's "Ireland Illustrated," may supply the information required:—

"Within a distance of half a mile from Sarah's Bridge (a), and in the enclosure of Phœnix Park, stands the memorial called the 'Wellington Testimonial.' The inhabitants of Dublin, participating equally with the other countries of Europe, in feeling of grateful acknowledgement of the heroes of Waterloo, determined to express their sense of these courageous deeds and warlike achievements, which will ever occupy a principal place in the history of Great Britain, by the erection of a memorial worthy of the event. Accordingly, subscriptions were contributed, amounting to £26,000, and placed at the disposal of the committee, composed of persons of acknowledged taste and much experience in the fine arts. Designs were furnished by artists from all parts of the United Kingdom for the inspection and adoption of the committee, who also offered premiums for, in their judgment, the six most meritorious. The public were gratified by an inspection of the most approved models, which were exhibited in the Gallery of the Royal Dublin Society; the majority appeared to favour the adoption of Mr. Hamilton's very elegant obeliskal design, combining all the advantages of simplicity and of magnitude which the present column possesses, while the man of pure classical taste at once claimed the appropriate model presented by Bowden, and copied from Trajan's Pillar. The most collosal, but least attractive, the design of Mr. Smirke, was, however, selected by the committee, to whom the public had delegated full

(a) Sarah's Arch or Island Bridge, spans the river Anna Liffey at the termination of the river navigation (if it deserves the name) and adjacent to the salmon fishery belonging to the Dublin Corporation. The appellation of "Sarah's Bridge" was conferred upon the structure in compliment to Sarah, Countess of Westmoreland and Vice-Queen of Ireland, who condescended to lay the first stone of the foundation on 22nd June, 1794.—A.W.

power for that purpose. Smirke's design consists of a base, formed by four great flights of steps, of inconvenient and gigantic dimensions, ascending to a height of 20 feet. The ground periphery of the base measures 480 feet, and the summit platform supports a square sub-plinth 60 feet in periphery by 10 feet in altitude. This, again, is surmounted by a pedestal 56 feet square by 24 feet in height, from which a truncated pyramidal column, measuring 28 feet round its base, rises to a height of 150 feet above its pedestal, diminishing in the ratio of an inch to a foot in its ascent. The total height of this great obelisk is 205 feet. The principal front, according to the original design, but which is not yet completed, is to be adorned by an equestrian statue of his Grace the Duke of Wellington, dressed in a military costume; for this the pedestal is erected, and stands near the summit of the stair-formed base, entirely detached from the principal column. The pannels of the pedestal of the grand obelisk are intended to be adorned by bas-reliefs of the principal battles won by his Grace, and the names of many of his well-fought fields are carved on the facades of the pyramidal shaft at equal intervals. The entire of the Memorial is of hewn granite stone, raised in the Dublin mountains; the situation is very well selected and was formerly occupied by a salute battery, which was erected there from its commanding position relative to Dublin generally. Indeed, the colossal scale of the Wellington Memorial prohibited its admission within the avenues or even squares of the city; nor is this to be regretted. Its present site is remarkable and conspicuous. Around its base the military forces stationed in Ireland are annually assembled, and make a grand display of accomplished discipline and of skilful manoeuvre; while the dull, monotonous character of the great pyramid itself is relieved by the agreeable accompaniments of undulating and extensive grounds, intersected by broad and noble avenues, and adorned by picturesque groups of forest trees, through the vistas of which the Memorial is occasionally seen in a pleasing and rather imposing aspect."

The above description, strange to say, does not give the date when the Memorial was commenced. It was, as a matter of fact, commenced in the year 1817. The smaller pedestal for the statue above referred to was removed, as money for the statue was not forthcoming. It is stated that its removal was a great advantage to the monument.

Upon the faces of the obelisk are inscribed: West—Comaigeel, Poonah, Amednagur, Ahsaye, Argaum, Gawilghur, Monkaseer; North Talavera, Fuentes, d'Onor, Ciudad Rodrigo, Badajos, Salamanca, Vittoria, Pyrenees; South—Rolica, Vimiera, Oporto, Busaco, Torres Vedras, Redinha, Sabugal; East—Bidassoa, Nivelle, Nive, Adour, Orthes, Tarbes, Toulouse.

In the description of the Memorial in "Irwin's Dublin Guide" (1853) the following footnote is given:

"By order of Commissioner Fonblanque, in February, 1853, the Duke of Leinster, sole surviving Irish Trustee (and others) to a fund raised at the London Tavern, 6th of May, 1829, by subscription, for erecting a statue to the Duke of Wellington in or near Dublin, commemorative of his aid in passing the Emancipation Act, regained possession of £1,500, principal with interest, which had lain among the assets of the broken bank of Biddulph and Co., London, upon condition that the statue be forthwith undertaken and executed according to the intention of the contributors."

All the old pictures of the Memorial show the pedestal which has been removed.—Yours truly, "A.W."

Dublin, 2nd June, 1902.

(It would be interesting to learn what became of the fund referred to by our correspondent, and if any further effort was made to erect the statue.—Editor "D.P.J.")

FORMER IRISH GUARDS.

By J. EDWARD COOPER, CAPTAIN 1st C.B. THE ROYAL FUSILIERS.

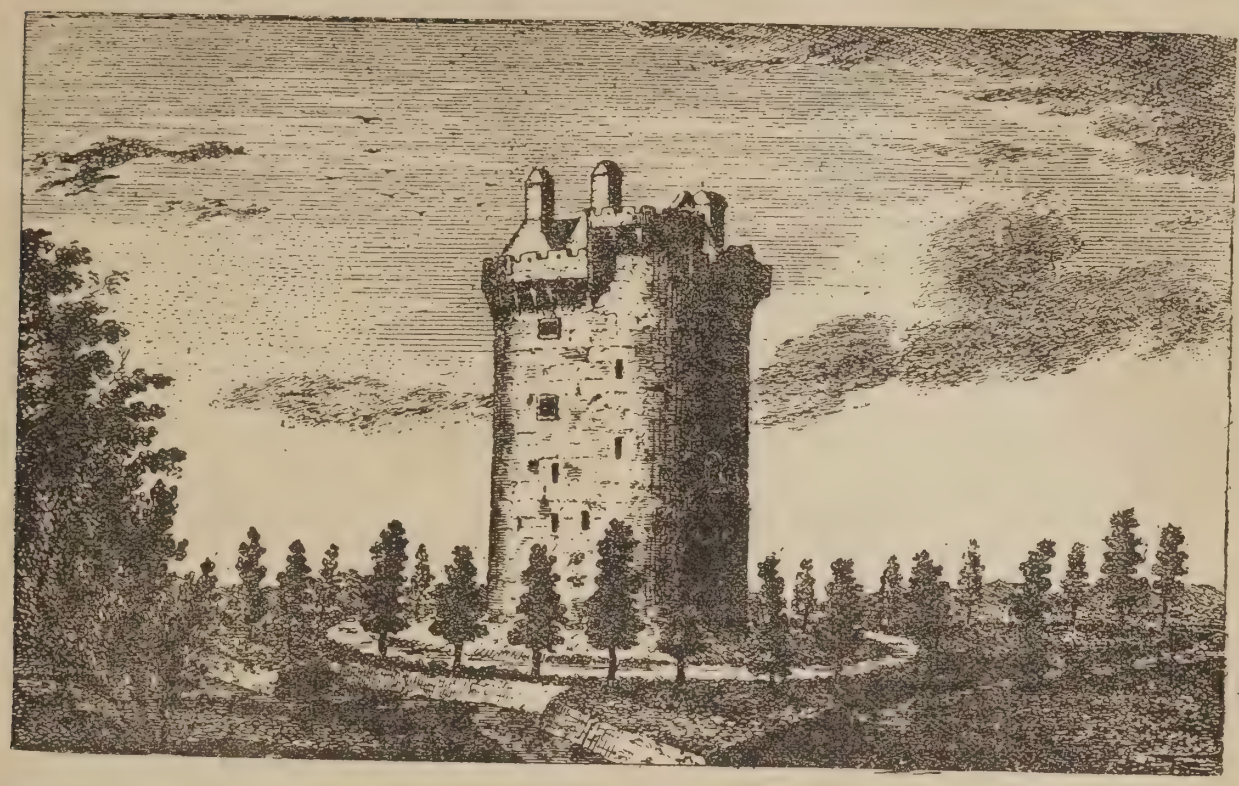
It will be generally remembered that in the year 1900 the late Queen Victoria, in recognition of the devotion and gallantry of the Irish troops in South Africa, authorised the formation of a regiment of Irish Foot Guards, and the recent presentation of colours to the regiment by King Edward VII. may render a brief account of the old Irish Foot Guards not devoid of interest. Although the name Scots Guards had been so familiar for generations, it was not very generally known that nearly two and a half centuries ago—in 1662, to be exact—Charles II. ordered a regiment of Irish Foot Guards to be raised. In an exhaustive article on the subject contributed by Lieutenant-Colonel C. R. Holden to the "Household Brigade Magazine" some two years ago, it was stated that the majority of the men were recruited in England, although others probably came from the old detached corps of pikemen and musketeers on the Irish establishment. It is certain, however, that the regiment was formed in two battalions, was rapidly recruited to the authorised strength, and completely equipped in all respects like the other regiments of Guards. It is also particularly opportune, in connection with the late ceremony on the Horse Guards Parade, to here observe that each company of the Irish Guards raised by the "Merrie Monarch" carried a colour, which was made of "yellow taffety and crimson," with the Royal badges embroidered upon it. The Irish Guards, when formed, were immediately employed in Dublin on the usual garrison and Viceregal duties, and were also occasionally requisitioned to quell disturbance, and sometimes even mutiny of other troops, as the Guards were stated to be "the only regiment on which dependence could be placed." Ten years after their embodiment war broke out with Holland, and several companies served afloat as Marines, and two were present in the naval action of Solebay. Shortly after the accession of James II. the Duke of Monmouth raised his famous rebellion, and four companies of the Irish Guards were brought over to assist in its suppression; it appears, however, that their services were not needed, and they returned to Ireland after the battle of Sedgemoor.

In 1686 the Earl of Tyrconnell, then Lord Lieutenant of Ireland, took an active part in carrying out James II.'s policy of "purifying" the Army, and some four hundred men of the Irish Guards were discharged in order to be replaced by Roman Catholics. At the Revolution nearly, if not quite, the whole of the 2nd Battalion of Irish Guards was brought over by King James, but the arrival of the Prince of Orange was fatal to its existence. On the flight of James, the army left by him, deserted in England, was disbanded, and the bulk of the men were without employment or any means of subsistence, and their sufferings were often terrible. The Irish Guards, whose colonel, the young Duke of Ormonde, was one of the first to transfer his allegiance to William, were eventually disarmed at Portsmouth and relegated to the Isle of Wight, where they were imprisoned and closely guarded until April, 1689. The unfortunate soldiers were then transported to Germany to form part of a force organised to oppose the Turks, "the Protestant officers having been previously transferred to Lord Forbes's Irish Regiment, afterwards the 18th Royal Irish."

The first battalion had, during this period, remained in Ireland, and when James made his desperate attempt to regain the kingdom, the Irish Guards were present at the historic siege of Londonderry, and suffered heavily. They also behaved with distinction at the Battle of the Boyne, and, though defeated, their fidelity and devotion avoided confusion and desertion, and enabled a retreat to Limerick to be conducted in good order. In 1691, at the sanguinary battle of Aughrim, the regiment was again distinguished by its gallantry. The final yielding of the Irish Guards was the result of events elsewhere, their history in Ireland being closed by the surrender of Limerick. Although every inducement was held out to encourage the men of the Irish Guards to transfer their services to William III., out of over a thousand only seven were found to do so; some seven hundred, by permission, returned to their homes, while about five hundred manifested a conspicuous example of loyal devotion, and followed James into life-long exile. Though in most of the last scenes of the regiment it appears in the character of an opponent to England, as the above-mentioned remnant became embodied in the historic Irish Brigade of the French army, even Englishmen can feel nothing but admiration for the conspicuous valour and constancy it had always displayed, and there is little doubt but that similar virtues will ever signalise the revived Irish Guards.

THE POET'S HOME.

Give answer, rolling waves!
Where must the minstrel go
To find some quiet land,
Unvisited by woe?
Some consecrated spot,
Where partings are unknown,
And on the violet turf
A blight is never thrown?
The waves reply, while bursting on the strand,
"Earth, in her ample bounds, owns no such land."



Answer, ye voiceful winds!
Where can the minstrel find
A wreath amid whose leaves
No cypress is entwined?
A crown of beauteous flowers
That may become a brow,
O'er which Neglect's cold hand
Hath driven Grief's dark plough?
And the winds answer—"Sunshine hath not smiled
On wreath like this in all our wanderings wild."

Oh! answer, aged Earth!
Where will the bard obtain
Reward for airy dreams
Created by his brain;
A recompense for toil
In haunts obscure and cold,
While one by one his hopes,
Expiring, turn to mould
Earth makes reply—"The bard's reward is rest
Under the green robe of his mother's breast."

Give answer, journeying birds,
That northern fields forsake
In quest of tropic grove,
Green isle and sunny lake—
Will ye not reach a clime
Whose radiance may control
The wild, unsated wish
That haunts the poet's soul?
And the birds warble—"By our flight be taught
That not in vain are homes of beauty sought."

Give answer, twinkling stars!
For lord of lute and lay
Cannot some kingdom fair
Be found far, far away;
Where sleep may fall like balm
Upon his wearied powers—
A sunny land of calm,
Unlike this world of ours?
And the stars answer—"At the fount of song,
In heaven, no more the minstrel suffers wrong."

LOHORT CASTLE, CO. CORK.

FROM SMITH'S "ANCIENT AND PRESENT STATE OF THE COUNTY AND CITY OF CORK," 1774.

LOHORT CASTLE, CO CORK.

AN ANCIENT KEEP OF THE MACCARTHYS,

NOW HELD BY THE PERCEVALS.

HISTORY OF THE PERCEVAL FAMILY.

In "The Ancient and Present State of the County and City of Cork," by Charles Smith, M.D., of which a second edition was published in Dublin in 1774, the writer gives the following description of Lohort* Castle, an ancient keep of the Mac Carthys, which passed by the fortunes of war into the hands of the Percevals, afterwards Earls of Egmont, whose name has recently been recalled to public attention by certain proceedings in London:—

"About a mile more east is the castle of Lohort, built in king John's reign; it is in the manor of Kanturk, and belongs to the Right Hon. the Earl of Egmont, whose ancestor, Sir Philip Perceval, placed a garrison in it, in the rebellion of 1641: But the Irish gained it by treachery, and held it towards the end of the war, when Sir Hardress Waller, with a battery of cannon, reduced it in May, 1650, and gives it the character of a place of great strength, in his letter to the Parliament. This castle remained for many years a melancholy proof of the devastation of those times; but it has been of late repaired by the Earl of Egmont. It is 80 feet high, the walls are ten feet thick, and moated round with a deep trench, which is passed by a drawbridge. In one of the upper chambers is an handsome armoury for 100 horse, well furnished with broadswords, bayonets, pistols, carbines, &c. Here is also a good library, and other apartments; and from the top of this tower is a noble prospect of a great tract of country."

The Percevals are a remarkable family, claiming lineal descent from Ascelin Gouel de Perceval, who accompanied William the Conqueror to England. The first of the family whom history records as having anything to do with Ireland was Richard Perceval, son of George Perceval, Lord of Tykenham, Somerset. "The life of this ultimately successful person," says Sir Bernard Burke, "was chequered and eventful in no ordinary degree. He was born in 1550, and educated at St Paul's School, then the most celebrated seminary in England, whence he was sent to Lincoln's-Inn, to acquire some general idea of the laws, esteemed, in those days, an accomplishment of the highest description. In both, his progress was brilliant, but his conduct dissipated and disorderly, so much so, indeed, that he incurred the displeasure of his father, who, upon his marriage with Joan, daughter of Henry Young, Esq., of Buckorn Weston, co. Dorset, entirely abandoned him, observing, that as he had ruined himself by his riots, he might recover himself by his wits. Thus unnaturally cast off, Mr. Perceval found means, by the credit of his reversionary estates, and the assistance of his friends, to maintain himself several years, during which time he had three sons and two daughters: but at length, through a failure of resources, and the increasing expenses of his family, he was obliged to quit the kingdom, and travelled into Spain, where he remained about four years. Being then informed of his wife's decease, he returned to England, hoping, now that the principal cause of his father's displeasure had been removed, he might again recover his good opinion; but that hope proving delusive, his relations, and particularly Roger Cave, Esq., of Stamford, who had married the Lord-Treasurer Burghley's sister, engaged on his side, and, by that gentleman's means, he contracted an acquaintance with Lord Burghley, who, being pleased with his talents, and moved by his misfortunes, and having endeavoured in vain to procure a reconciliation with his father, determined to promote his fortune by employing him in the management of those state affairs which required the greatest trust and secrecy. Thus he continued till the year 1586, when, whilst the court of Spain was meditating the armada, an English ship succeeded in taking from a Spanish vessel letters from the Low Countries, which, by intimations from abroad, were known to contain the secret. Those letters being brought to Lord Burghley, were laid by his lordship before Queen Elizabeth in council; but the contents being in cipher, the lord-treasurer proposed that the papers should be entrusted to this Richard

*Dr. Joyce, in his "Irish Names of Places," gives the spelling as Lohort, and the derivation from the Irish lubh, lubh-ghort (pron. looart, loovart), meaning garden (literally herb-plot). Lohort lies about seven miles or so to the west of Mallow.

Perceval, who returned them the next day after they were placed in his hand to her majesty in person, deciphered, translated, and fairly transcribed in Spanish, Latin, and English. This was the first certain intelligence of the Spanish design, and Perceval was admitted instantly into the queen's favour, and from that moment his road to honour and fortune was open and unimpeded. Having subsequently filled the office of secretary of the Court of Wards in England, for several years, he was nominated, in 1616, registrar of the Court of Wards in Ireland, where, after obtaining considerable landed property, he died in 1620, and was succeeded by his son, Sir Philip Perceval, Knt., a very distinguished statesman, who, having been actively employed in the government of Ireland for a series of years, obtained grants of forfeited lands there to the extent of one hundred and one thousand statute acres. Dying 10 Nov., 1647, he was succeeded by his eldest son, Sir John Perceval, Knt., who was created a Baronet of Ireland, 9 Sept., 1661, by patent, containing this remarkable clause, that 'the eldest son, or grandson, shall exist a baronet, after the age of twenty-one years, at the same time with the father or grandfather. Sir John died at the age of thirty-six, 1 Nov., 1665, and was succeeded by his eldest son, Sir Philip, who died unmarried, 11 Sept., 1680, when the title devolved upon his brother John, the 3rd son of the 1st baronet (the 2nd son, Robert, having been assassinated, 5 June, 1677, in the Strand, London, by some unknown hand). Sir John died 29 April, 1686, of a contagious distemper caught from the prisoners at the assizes of Cork, where he had been officiating as foreman of the grand jury. He was succeeded by his second son, John, who, after becoming a privy-councillor of Ireland, and sitting for several years in the Irish House of Commons, was elevated to the peerage of that kingdom, by patent dated 21 April, 1715, as Baron Perceval of Burton, Co. Cork, with limitation to the heirs male of his father; and 25 Feb., 1772, his lordship was created Viscount Perceval, of Kanturk, also in the county of Cork, with the annual fee of twenty marks, payable out of the Exchequer, attached, to support the honour. In 1732, the viscount obtained a charter to colonise the province of Georgia, in America, and being nominated president thereof, was advanced to an earldom in the peerage of Ireland, by patent, dated 6 Nov., 1733, as Earl of Egmont." The second wife of the second earl was created a peeress of Ireland, 23 May, 1770, as Baroness Arden of Lohort Castle, with remainder to her ladyship's heirs male. A noteworthy scion of this family was the Right Hon. Spencer Perceval, who, born 1 Nov., 1762, became a member of the English bar, and successively solicitor and attorney-general. He afterwards, 31 March, 1807, joined the administration of the Duke of Portland, as chancellor of the exchequer, and when the Duke died, 30 Oct., 1809, became, as well as chancellor of the exchequer, First Lord of the Treasury, 2nd Dec. of that year. While thus Premier, he fell the victim of one John Bellingham, by whom, under the frenzy of a supposed grievance, he was assassinated in the lobby of the House of Commons, 11 May, 1812.

THE PANTHEON OF THE GAEL.

To the Editor of the "Dublin Penny Journal."

Sir—In Ara we are at present on the war-path; we are painted (Picti), and our colour is blood-red (Cruth). Against our aristocratic masters, both Gaedhil and Saxon, we, the Aithech Tuatha, are now advancing. Bishop O'Brien in his Irish Dictionary (Preface, p. xi.) has informed us that the word Gaedhil is but an abusive writing of the word Gaill, the plural of Gall, and the words Gall and Celt have been shown by Todd (Wars G. G., p. xxix.) to be the same. The words Celt, Gall, Goth are also equivalent, and the name comes from an old word, Celt, Cell, Tel, Cet, etc., meaning to cast, hence Cet Mac Magach and Celtchar Mac Uitchechar and William Tell, who has been regarded by the Rev. S. Baring-Gould as non-historical. From the old mode of fighting by casting of weapons the word for casting came to mean war, and the English word War comes from an old root meaning to cast; hence we may explain the frequent reference to the casting of stones in Irish folk-lore as having reference to wars of the giants. The word Gaidhel, Goth, Celt, Gall, thus means warrior in derived signification, and Gall also came to mean foreigner, and the Gaedhil now term the Saxons Gaill, or "Foreigners," just as they termed the Norse, Gaill. Mil or Milidh, the eponymous ancestor of the Milesians, means warrior, and is an old translation of Gaedhel, Goth, or Celt. One of the Iberian forts (Murbech) in Arranmore was named from Mil—

Ro gni Adar theas a theach.
Atnadar Mil or Murbech.
"Adar made his residence in the South.
They stationed Mil at Murbech."

Professor Rhys in his Hibbert Lectures has completely demolished the Milesian theory, and Eber, Erimon, Ith, have been proved to be non-historical, and, as a matter of fact, Ith, from whom several plains in Ireland were named, was one of the oldest of the Iberian deities.

Mr. M'Manus says that no Gaelic family has ever claimed a descent from the people of the Tuatha De Danann. I think that O'Donovan makes a similar statement; but let us see whether this be so. All the chief Gaelic families in the County of Clare claim to be Dal g Cais, and to be descended from Cormac Cas. O'Donovan in his Introduction to "Boyish Exploits of Finn" says:—"The only known descendants of our hero now known to exist are the Dal Cais—i.e., O'Briens of Munster—and their correlatives. Cormac Cas, King of Munster, who married Samair, the daughter of Finn by Grainne, daughter of Cormac Mac-Airt, monarch of Ireland, had by her . . . Fearcorb, the progenitor of the Dal Cais."

In the "Agallmh na Seanorach Silva Gadelica," p. 245, we read—"Whence sprang his (Finn's) mother?" She was Muirne smooth-neck, daughter of Tadg, son of Nuada, of the Tuatha De Danann."

In "Cath Cnucha" (Windish Irish Grammar, p. 139), the wife of Tadhg Mac Nuadat is stated to be Rairiu, daughter of Donn Duma, one of the chiefs of the Tuatha De Danann, who fought in the battle of Ventry.

In the genealogy of the race of Aenghus Bulga, taken from the "Saltair-Chaisil" and the Book of the Island of Inis-Duine, and given in "Corca Laidhe," p. 25, Dunghalach is traced to Lugh Manair, son of Lugh, son of Ethlenn, son of Lugh, son of Ith, son of Breogan. Here we have Lugh MacEthlenn, of the Tuatha De Danann, derived from Lugh MacItha, of the Milesians. Here Ethlenn is masculine, and Ethlenn is also masculine in Baile an Scail, quoted by O'Curry, Lectures, p. 621, and Professor Rhys (Hibbert Lectures, p. 417), says that this is a display of ignorance on the part of the writer of Baile an Scail. The Oxford Professor of Celtic is mistaken, for in Irish mythology difference of sex is a matter of indifference.

It is now beginning to be thought by several able Irish scholars that the so-called Ossianic cycle is the oldest cycle, or, at least, contains the oldest elements of Irish literature, and the particulars of the Irish place names of the Ara district, which I am giving in "Dublin Penny Journal," tend to prove that this is the correct view. The connection of Eochu, Ane, Gar, Fer Fi, Nechtan, Cuil, Lodan, Domnal, Aoife, Ebliu, Ailell Marg, Dil, Guaire, Dara, Liath, Finn, Conan, Lugh, Ughaine, Oc, Muiredach, Fermora, Caoilte, Sin, Fintan, Deagh, and dozens of other important names, with the neglected district of the Iberians or Araid of Ara, will now have to be encountered by the upholders of the Milesian theory.

J. F. LYNCH.

ANCIENT IRISH SOCIETY.

ITS ELEMENTS.

Having been away on leave I could not answer Mr. M. J. Byrne's most interesting critique of an article of mine on the above subject which appeared recently in the "Dublin Penny Journal," before this. In the first place, let me say that I do not pretend to be anything more than an amateur in the circle of subjects connected with the ancient history and literature of Ireland. Mr. Byrne has raised four important points with regard to the division of the people, the wanderings of the tribes, the Geilfine system, and the relations of the chief and his clansmen. He will see that in the course of my article I alluded, like himself, to the two principal classes, the Neme and the Feini, the free and the not-free of the ancient Irish society. When speaking of the roaming nature of the ancient tribes I was describing an age previous to their localisation. Later on in the said article I had spoken of the settlement of the tribe and the extension of its borders. Of those prehistoric rovers, the tinkers of our day are, doubtless, an unhappy survival. The love of tramping is certainly very strong in some classes of the community. Heredity alone can explain it. I did not intend to convey the impression that there was no such thing as individual property. I merely wished to show how personal wealth was acquired. And in this matter I fall back on the authority of Professor Richie. Furthermore, the same explanation of the Geilfine system that I gave will be found in Walpole's "Kingdom of Ireland." But, of course, Mr. Byrne need not accept the conclusions of either. And with regard to the chief forcing stock on his clansmen, I did not say he was entitled to do so. I merely said he often did so. Might was generally right in such cases. And it is very evident that the poorer classes in early days were badly treated by the great lords. The custom of "coshering" which survived up to Cromwellian times was but a similar unjust advantage taken by the landlord of his tenant's weakness and devotion. But in matters so obscure, where we have little or no clue to guide us, we are, at least, building without straw. And we must not fall out if we do not all build in the same style. The ancient history of all countries is full of romance. For it is romance that made it picturesque as it is imagination that makes its dead bones live. In my short article on the elements of ancient Irish Society I had to curtail, omit and condense much interesting matter through lack of space, and I simply tried to write a paper that would make the ordinary reader take an interest in the ancient history of his native land, and I have been more than rewarded by having drawn out the excellent comments of one who has shown himself no ordinary reader.

F. A. MONTGOMERY HITCHCOCK.

THE HISTORY AND ANTIQUITIES OF THE CITY OF DUBLIN.

FROM THE EARLIEST ACCOUNTS:

Compiled from Authentick Memoirs, Offices of Record, Manufcript Collections, and other Unexceptionable Vouchers,

By THE LATE WALTER HARRIS, ESQ.

CHAPTER IX.—Continued.

A.D. 914. A sharp naval engagement (Ware Antiq.) happened near the isle of Man between Barred and Reginald Mac-Yvor, two Danes (the latter of whom was king of Dublin). Reginald obtained the victory, and slew Barred and a great number of his party.

A.D. 916 (Carad. of Lhancarvan). The Ostmen of Dublin made an expedition into the island of Anglesey in Wales, and wasted it from end to end with fire and sword.

A.D. 919. Was memorable (Ware) for a sharp battle fought betwenn Neill Glundub, king of Ireland, and the Ostmen, near Dublin, on the 15th of September, in which king Neill and a great number of the principal officers of his army were slain. Donat Mac-Flan O-Melaghlin succeeded him, and the year following revenged his predecessor's death by the greatest slaughter of the Danes that ever before happened in Ireland; insomuch, that scarce one half of their great army escaped (Mac-Geoghan's Annals MS.)

At this time Keallachan Cashell was king of both the divisions of Munster, and exerted all his powers in extirpating the Danes out of his dominions, whom he defeated in several battles, and by main force compelled them to abandon their settlements. These foreigners, despairing of being re-initiated in their old possessions by force of arms, had recourse to a detestable stratagem. Reginald Mac-Yvor, king of Dublin, had all the other Danes of the kingdom tributary to him. Under colour of desiring peace, he drew the king of Munster into a snare, which was near proving fatal to his life, as it did to his liberty. He offered to give him his sister in marriage, to conclude a perpetual league offensive and defensive with him, and to send hostages to him for the due observance of the agreement. The fame of the lady's beauty and accomplishments, together with the advantages of such a union, fired the young prince, and he made great preparations to espouse the Dane's sister. He intended to take the flower of his army with him in order to conduct the princess with the greater state into his province; but upon the representation made by prince Kennedy (to whom he proposed to commit the government during his absence) of the danger of leaving his kingdom destitute of forces, he set out for Dublin, attended by Duncan, one of the sons of Kennedy, and a small number of troops sufficient only for a body guard. The consort of Reginald Mac-Yvor, who was of the birth of Ireland, found means of getting into the knowledge of her husband's secret designs, and either out of a principle of generosity or love, having before seen king Keallachan at Waterford, she privately informed him of his danger, when he had arrived near the suburbs of the city. The king of Ireland was suspected to have known and approved of the plot, and being an enemy to the king of Munster, for refusing to pay him the usual tributes, concealed it.

King Keallachan, having thus received information of the conspiracy, resolved to return home with the utmost speed; but his few troops being surrounded by those whom Reginald had placed in ambush, were, after an obstinate resistance, cut to pieces, and king Keallachan and Duncan Mac-Kennedy made prisoners, and conducted first to Dublin, and afterwards confined under a strong guard at Armagh.

Kennedy, the regent, being informed of the treachery of Reginald, and of the imprisonment of the king and his son, resolved to attempt their release, and having mustered the provincial troops, he gave the principal command of them to Donogh Mac-Keefe, petty king of Fermoy, an experienced soldier. He also fitted out a fleet in the ports of Munster, and made Failbe Fion, king of Desmond, admiral of it; suspecting that the Dane might remove the prisoners on board his fleet (which then roved in the eastern seas) in case there was any danger of a rescue.

The Munster forces took their route through Connaught, to avoid any opposition from the much suspected king of Ireland. Upon their approach to Armagh, the Danes being informed of their strength removed the prisoners on board their fleet, which then lay in the bay of Dundalk. Mac-Keefe pursued, but came too late; and now it appeared that the precaution of Kennedy in fitting out a fleet was of singular advantage. For whilst the Munster forces stood distracted on the shore, unable to assist their king, the fleet appeared in sight, and attacked the Danes with such vigour, that they obtained a complete victory and recovered their king and prince Duncan.

Reginald escaped to Dublin by flight, where he died in 921, oppressed with grief for the disappointment of this shameful attempt. King Keallachan having recoverd his liberty, and provided for the necessities of his fleet and army, put himself at the head of his troops, and directed his march towards Munster. Mortough Mac-Flan, king of Leinster, being in league with the Dane, opposed his passage through his territories, and endeavoured to cut off his retreat. But the king of Munster forced his way, and arrived at his court without any loss, and was received with infinite joy by his subjects. Keating (Hist. 2d part, p. 75) improves this account with many new circumstances, but he misapplies it in point of time, and places the scene under the government of Sitrick, the son of Turgesius, which is impossible, Turgesius having died near eighty years before; nor was any son of his king of the Ostmen of Dublin.

A.D. 921. Upon the death of Reginald Mac-Yvor this year, his son Godfrid Mac-Reginald succeeded (Ware Antiq.) in the government of Dublin, who the same year marched an army into Ulster, and in November plundered Armagh, which it seems had recovered its liberty by the late success of the king of Munster.

A.D. 924. Godfrid made an expedition (Ibid) towards Limerick, in which he lost a great part of his army; nevertheless, upon his return, being joined (Annals of the four Masters) by some troops of his countrymen of Waterford, he ravaged and plundered Kildare.

A.D. 926 (Waræi Antiq. cap. 24). King Godfrid sent an army into Ulster under the command of his son Aulaffe, who was twice put to flight by the Ultonians; and at length escaped with difficulty by the assistance of his father, who had followed from Dublin with a body of fresh forces. Kildare was the year following plundered and miserably spoiled (Annals of the four Masters) by Godfrid on the festival of St. Bridget, the patroness of the place.

A.D. 934. King Godfrid died (Waræi Antiq. cap 24), and left behind him an infamous character for his cruelties. He was succeeded in the government by his son Aulaffe Mac-Godfrid, called Anlaph by the English historians, who is supposed to be the same person that was routed in the battle of Brunaburg in Northumberland, by Athelstan, king of England, in the year 937; whose disgraceful flight the Saxon chronicle thus describes (Ir. Hist. Libr., p. 156), "The sorry remains of Anlaph's army put to sea, and made for Dublin, returning to Ireland in a shameful manner."

A.D. 941. This year (War. ibid) Aulaffe was taken off by a sudden death. Caradocus of Lhancarvan calls him, "Abloick chief king of Ireland," and places his death under the year 939, though the book of Margan says he died in 940. However, that may be, he was succeeded by his brother, Blacar Mac-Godfrid.

A.D. 944. (War. Antiq c. 24) Congelach Mac-Mælith, king of Ireland, by the assistance of Brien, king of Leinster, assaulted, took, plundered, and burned Dublin; having slain (as it is said) four thousand Ostmen there, and put the remainder of them, with their king Blacar, to flight.

A.D. 945. (Ibid) King Blacar having levied a good body of auxiliaries from among his countrymen, marched back to Dublin, and recovered and repaired it.

A.D. 946. (Ibid) The Ostmen of Dublin, to revenge their late losses, laid a great part of Meath waste.

A.D. 947. (Ibid) The Ostmen of Dub-

lin were again put to flight by Congelach, king of Ireland.

A.D. 948. (War. Antiq. c. 24) The Ostmen of Dublin renewed the war, and were again vanquished by king Congelach, Blacar, king of Dublin, and about sixteen hundred of his subjects falling in the action. Godfrid Mac-Sitrick succeeded Blacar. About this time, the Ostmen settled in Ireland embraced the Christian faith; and some are of opinion that they this year founded the abbey of the B. V. Mary, near Dublin, for Benedictine monks; though others hold that it was founded long before by Melaghlin or Malachy, king of Ireland (who died in 862), and by one Gillehoholmoc and Roisia his wife, while others ascribe that action to Donald Gillemoholmoc alone.

A.D. 950 (Ibid) The Ostmen of Dublin plundered Slane in Meath, and burned it down to the ground. But the year following, having wasted a great part of the same territory under the conduct of king Godfrid, upon their return to Dublin loaded with spoil, they were intercepted by the Irish, and put to flight, with the slaughter of six thousand men, and in the rout Godfrid was slain, and was succeeded by Aulaffe Mac-Sitrick.

A.D. 953. (Annals of the four Masters) The Ostmen of Dublin again plundered Kildare, and slew Cullen Mac-Kellach, the abbot of it.

A.D. 956. (War. Antiq. c. 24) A sharp battle was fought between Congelach, king of Ireland, and the Ostmen of Dublin at Tiguiran in Leinster, in which Congelach was put to flight and slain. Caradocus of Lhancarvan erroneously places this action in 953. See Ware's Lat. Antiq. cap. IV.

A.D. 959. (Ibid) Aulaffe Mac-Sitrick, petty king of Dublin (called Abloick, king of Ireland, by Caradocus of Lhancarvan), landed in the island of Anglesea, and plundered Holyhead (called by the inhabitants Caer-Gubi) and the whole territory of Lhyn. Yet some (Lib. Mar. five lib. Hergesti) ascribe this action to the sons of Aulaffe.

A.D. 962. (War. ibid) Godfrid, a Dane, one of the sons of Aulaffe Mac-Sitrick, died in the lifetime of his father. It is said that about this time Edgar, king of England, subdued a great part of Ireland, and particularly "the most noble city of Dublin." Of this, see what is said before Chap. I. out of the preface to king Edgar's charter.

A.D. 964. (Annals of four Masters) The Ostmen of Dublin marched out as far as Kildare, and there took a great booty and many prisoners, who were put to ransom.

A.D. 970. (War. Antiq.) A battle was fought at Kilmore between Donald O'Neil, king of Ireland, and Donald, the son of the deceased monarch Congelach, assisted by the auxiliary troops of Aulaffe Mac-Sitric, king of the Ostmen of Dublin, in which many fell on both sides; but king Donald received the greatest loss.

A.D. 977. (Ibid) Aulaffe Mac-Sitric slew in battle Mortagh and Congelach, two of the sons of Donald, king of Ireland.

A.D. 980. (Ibid) The power of the Ostmen of Dublin, and of other parts, was greatly broken in the memorable battle of Tarah by Melaghlin, king of Ireland, who this year succeeded his father, king Donald. For in that battle, besides some thousands of common soldiers, the principal commanders and leaders of the Ostmen were almost all slain, and among them Reginald, the son of king Aulaffe, who took these losses so much to heart that the following year he undertook (Annal. Insul. Omn. Sanct.) a religious pilgrimage to the island of Hy or Iona, where he died of grief, after a reign of thirty-one years, and was succeeded in the government of Dublin by his son, Glunlaran Mac-Aulaffe.

A.D. 981. (War. Antiq.) King Melaghlin, animated by the successes of the former year, marched into Fingal, a little territory under the dominion of the Ostmen of Dublin, and wasted it with fire and sword, at the same time setting all the Irish prisoners at liberty who were in the custody of the Ostmen. At length a peace was concluded between this victorious Irish monarch and the Ostmen of Dublin, who to repair their late losses, having mustered up a body of Auxiliary forces, broke into the territories of Brien Mac-Murrough, king of Leinster, which Brien endeavouring to defend, he was taken prisoner by them, and soon after slain.

A.D. 983. Instead of a necessary union between the princes of Ireland against the common enemy, they joined with the Danish forces in making war on each other. King Melaghlin (as is said before) having made peace with the Ostmen of Dublin, hired (McGeoghan's Annals, MS.) a considerable body of their forces under the command of king Gluniaran, and marched against Donald Clæn Mac-Lorcan (who was now king of Leinster upon the death of Bryan), and defeated him in a set battle. But this victory cost the Ostmen dear; for besides the loss of a great number of common soldiers, many leaders (War. Antiq.) of principal account were slain; and among the rest Patrick Mac-Ivar, petty prince of Waterford, a young officer of great hopes, fell.

A.D. 985 (Annals of four Masters). The Ostmen of Dublin made an irruption northward as far as Derry, and with such cruelty, that they spared neither religious nor lay man that fell into their hands; and among others Malkyaran O'Maigne, abbot of Derry, suffered a cruel martyrdom.

A.D. 989 (War. Antiq.) Gluniaran Mac-Aulaffe, king of Dublin, was this year murdered by one of his domestics, called Colvann (McGeoghan's Annals), and was succeeded by his brother Sitrick Mac-Aulaffe. Caradocus of Lhancarvan, deceived both in the name and title, calls this Gluniaran, who now was killed, Abloick, king of Ireland. "The same year (according to the account given by McGeoghan), king Melaghlin fought the Danes in their own quarters in Dublin, slew grat numbers of them, where he remained three score nights, and he pressed them so close in their camp without the town, that he confined them to drink nothing but salt water. At length they submitted, and agreed to pay him a tribute of an ounce of gold out of every capital messuage and garden in Dublin yearly at Christmas to him and his successors for ever."

A.D. 994 (War. Antiq.) Sitric Mac-Aulaffe, king of the Ostmen of Dublin, was driven into banishment by his subjects of the city, headed by Hymar (Annals of the four Masters), who reigned a short space in his stead; but the same year he was recalled and restored to his kingdom, from whence he banished Hymar.

A.D. 996 (Ibid). The Ostmen of Dublin made an expedition into Meath, and wasted and plundered Kells, then called Kennanuse; and two years after they did the like by Kildare.

A.D. 999 War. ibid). Marian or Mælmurry Mac-Murrough, by the assistance of Sitric Mac-Aulaffe, king of Dublin, got possession of the kingdom of Leinster; his predecessor, Donald Mac-Lorcan, being taken prisoner in battle, and obliged to abdicate. Before the end of this year, Brian Boro, the valiant king of Munster, overthrew the ostmen of Dublin in a battle fought at Glenanin, and from thence he marched to Dublin, which he took and plundered.

A.D. 1000 (War. Antiq.) The Ostmen, having given hostages for their allegiance to Brien Boro, repaired and fortified Dublin with new works.

A.D. 1004. Caradocus of Lhancarvan relates, "That Gulfath and Ubiad, two Irish lords, were taken prisoners by the Scots, who put their eyes out, and also destroyed the country and town of Develin." By the Scots in this passage are to be understood the Irish in the northern parts; and Caradocus himself afterwards under the year 1031, distinguishes them by the name of Irish-Scots

A.D. 1013 (Ibid). Leinster was miserably wasted and plundered first by Murrough O'Brien, son to Brien Boro, then king of Ireland, and afterwards by king Brien himself, even up to the walls of Dublin. In the meantime the Lagenians and Ostmen of Dublin made peace among themselves, and, joining their forces, used their utmost endeavours to defend their country, though without success.

(To be continued.)

TENT LIFE FOR CONSUMPTIVES.

A scientist, whose name has not been divulged, has been experimenting on the effects of tent life upon consumptives. To this end he pitched his tent during the coldest part of January and stayed in there until the early spring, engrossed in his experiments, but finally seeing patients and announcing that he wanted as many consumptives as possible to prove the truth of his theories. "The life there," he said, "quickly fortifies a man's bodily powers; it envolutes, then evolutes a man back toward ancestral life. The skin, nails, and hair toughen and thicken; pulmonary catarrh stops, hemorrhages cease. A civilised man loses his sensitiveness; his emotions change. He becomes insensitive and fearless. All his energy goes to nutrition; his intellectual centers are dormant. All his powers are concentrated on building and repair. He falls asleep at twilight and wakes at dawn, ready to eat. Incidental disaster affects him little; he changes from a hothouse plant to an oak. The fear and panic customary to a crowd of consumptives no longer affects him, and thus the greatest danger of hospitalism is avoided."

A LITTLE WILFUL ROSE.

BY K. F. PURDON.

"What on earth have you got those things on for?" asked Albert.

There were three of them, young people, sitting in the meadow, where the hay was "making itself" one summer's day—two girls and Albert—only he would have reversed this order of statement, for Albert was always No. 1 to himself. He was sprawling on the hay aforesaid and smoking, and he asked his question because he considered it helped in the attitude of superiority he adopted towards girls. And he threw some contempt, and even a bitterness, into his words, which he did not really feel. For the "things" he was looking up at hanging over the edge of a hammock, though they were only ragged tennis shoes three sizes too big, held a pair of the prettiest feet in the world. And no one who has not tried it knows how small and slender a foot can look under such conditions. Albert Munro felt their fascination to the full.

Rosy, who owned the feet—the shoes were Aunt Rachel's, and had just come to hand when Rosy was in too desperate a hurry to look for her own—Rosy deigned no reply. She was craning her slender neck to stare down at something in the grass, and she presently said, just as if Albert hadn't spoken at all—"Oh, what a darling mouse! be quiet, do! Oh, if only I had a crumb!"

"Where! where?" cried Albert, starting up—for the laziest of Britons becomes alert at the prospect of something to kill. Mischievous little beast! I'll soon——"

"Let it alone!" cried Rosy, and she was artful enough to gaze earnestly at a tuft of grass, which certainly was not that mouse's city of refuge, and she laughed provokingly at Albert's important, red-faced stamping in the wrong spot. "Here, tie this for me!" holding out one of the big shoes. "How clumsy you are! Be quick! I want to go pick raspberries!" In a trice she had swung herself out of the hammock, and was flying to the garden.

"Won't you come, too?" said the other girl to Albert. She was posed in an approved attitude on a garden seat. She wore patent leather shoes two sizes too small, and looked as if she had stepped out of a fashion plate. She laughed nervously as she spoke. But Albert deigned no reply, as he strode moodily away towards the stables.

Clara looked after him quite tenderly. Fortunately her good angel intervened, so she did not follow and try to console him. She got up, too, and went after Rosy to the raspberry plot.

The two girls worked away, Rosy chattering—then, "Here's Albert!" Clara proclaimed, with bated breath.

"So it is. Why ever didn't you come before? Hurry up, now, and help! No, indeed, not here, crowding us up! Go to the other end of the plot! If you're good and work hard maybe I'll get Aunt Rachel to ask you to tea."

Albert meekly obeyed. Temper is only waste of energy when the person you intend to impress is quite unconscious of your majestic gloom. But Albert took it out of Clara by ignoring her utterly. Till Rosy's advent a week before she had been the recipient of his lordly attentions. Now she had palled on his taste.

Clara was good, but monotonous, like boiled leg of mutton. She "stood no show," as Albert would have said, beside Rosy—slim, laughing, busy Rosy, who enjoyed everything, was always sure of herself, was quite indifferent to what he said or thought—above all, was a novelty. Poor Clara!

Rosy had the further distinction of having overworked herself at school, and being run down. Hence her appearance at Aunt Rachel's for country air and milk.

"Here's Aunt Rachel! See, Auntie, what a lot we've picked! But Mr. Munro is as lazy as—as——"

"My dear!" said Aunt Rachel, "I thought you knew that fruit was to be sent to market this morning!" Aunt Rachel was tall and thin. A good deal of her small means came from her garden.

"Ah, dear, I forgot all about that! I am sorry!"

Rosy's penitence was pretty to see. Clara was sympathetic—Albert not ill-pleased that provoking Rosy was in fault.

"We'll make raspberry vinegar," said Aunt Rachel, placidly. "Meantime, I want a snapshot to illustrate a story." Aunt Rachel spent a good deal of time and postage sending contributions to magazines. "Here, Albert—now, Rosy—in front of this rose-bush. He is going away, and you are giving him a bud as a token, 'The Fond Farewell,' it is called."

Albert, with a conscious smile, assumed the desired attitude. Clara looked on miserably enough, and Aunt Rachel adjusted her camera.

But at the critical moment Rosy burst out laughing.

"I can't, indeed I can't, help laughing! Unless you'll stand with your back to me! Why on earth did you look at me like that?"

And away danced Rosy, while Albert, furious at the ridicule cast on his tender glances, suddenly remembered "letters that must be written" (who gets such letters?) and took a hasty leave, disregarding Aunt Rachel's entreaties that he would pose with Clara.

. . . . . .

Next morning, "Well, here you are, turned up again like a bad halfpenny! I can't shake hands, I'm all over raspberries. What happened you last night to disappoint me like that, going off in such a hurry?"

"Did it disappoint you?" said Albert.

And it was a foolish thing to say to Rosy through the kitchen window, she standing inside washing raspberries through a sieve. Her serge skirt and blouse were protected from possible stains by a huge, sensible apron of Biddy the cook's, a world too wide for slender Rosy.

When she got hot or excited her face looked as if it had been badly painted. There was no shading from creamy white to crimson flush in dabs. Rosy was always eager, and the kitchen fire was very hot that morning. She presented to Albert's gaze, cheeks "as red as two roses," so Biddy described them.

But a lurking dimple was always in stock to qualify the boundary line between red and white. It came into play now. Albert fell a victim. He lost his head. "Were you disappointed last night?" he repeated in an eager whisper. The window was open; Rosy was within arm's length. He couldn't resist that dimple, and the wicked little loose locks of hair about her ears.

But it was like putting his hand into a hornet's nest when he—well, he actually tried to put his arms round Rosy. "How dare you?" flamed Miss Rosy. "Let me go. Ah! I'll soon make you!"

Quick as thought she scooped up a handful of the juicy, crimson raspberry mash, and lodged it in Albert's admirable beard.

"You and your old arm, indeed!"

But why "old" was not clear. Albert claimed but seven and twenty, and presumably he had not been born piecemeal. But seventeen, though sweet, is not always reasonable.

"She made him leave that, so she did, anyhow, that shot!" said Biddy, who had come into the kitchen with a kishful of turf, in time to be a gratified witness of Mr. Munro's discomfiture. "An' she might have had him herself, as aisy as kiss hands, if she'd only have follied on the gait she was goin'." It was three weeks later. Rosy was back at school, and Aunt Rachel and Biddy were eagerly discussing a welcome break in the stagnation of their lonely lives—the private marriage of Mr. Albert Munro and Clara Bates.

"Then that accounts for it," said Aunt Rachel, solemnly. Like many spinsters of the old school, she held all male mankind in high esteem. Their attentions were not to be trifled with. She could not understand Rosy's cavalier ways.

"He was just caught on the rebound," she went on. "Poor Rosy! And it would have been so nice to have had her settled near me. I only hope she won't live to regret it!"

"There's as good fish in the say as ever kem out of it!" said Biddy, sententiously.

HOW THE OCTOPUS EATS.

"Never before had it fallen to my lot to see the terrible monster we encountered on the last passage from San Francisco towards Nanaimo in the barque Willscott of Honolulu," said a skipper the other day. "We knew that the octopus grew to an immense size, as Banks and Solander, who accompanied Captain Cook in his first voyage around the world, found the dead carcass of one floating on the water to the westward of Cape Horn. It was supposed to be twenty by thirty feet, the body only; the tentacles were hanging under water. It was surrounded by myriads of birds, which were feeding greedily on its remains. Pliny also mentions a similar monster, having eight arms thirty feet long and a corresponding girth, and many other writers, too numerous to mention, have certified to its actual existence. But I did not believe that anything similar to the terrible 'devil fish' described by Victor Hugo was really in existence until I had ocular demonstration of the fact on this passage.

"Its eyes were large, of a greenfish tint and somewhat protruding; its mouth, however, was not so very large and it appeared to be shaped like a parrot's bill; its tentacles were tapering and, like its body, of a grayish colour, covered with spots, it appeared to possess the chameleon-like power of changing the colour of these spots in a most extraordinary manner as fast as the eye could detect the changes; they varied from a very rich crimson to a dark, dull brown, these changes, no doubt, indicating the high state of excitement under which the creature was at the time.

"Suddenly the octopus discharged a huge jet of a dark-coloured fluid full into the eyes of a sunfish, and then, rushing forward with the rapidity of an arrow, it encircled its prey with the long tentacles, and in another moment the victor and vanquished had disappeared below the surface of the water.

"In a few moments more we had sailed right over the scene and found the water was coloured almost black for a space fully 200 feet in diameter, and we noticed an odour slightly resembling iodine rising from the water; our patent log line of snow-white cotton, which was towing astern, was coloured almost black, and it has not yet assumed its white freshness, although it was towed in the water fully 800 miles since the above episode.

"About twenty minutes after we had passed over the spot we saw the huge creature again on the surface enjoying its meal in a very leisurely manner, rolling the body of the unfortunate sunfish over and over and biting off large mouthfuls with its cruel-looking beak.

"I knew before that these huge octopods and their relatives, the decapods, were not altogether mythical, as they have at the United States National Museum in Washington a papier mache cast of one of the latter, which was found stranded on the north shore of Trinity Bay, Newfoundland, on the 22nd day of September, 1877. The total length of this specimen, including tentacles, was only 60 feet, so it is quite safe to infer that it had not become of age when it was wrecked."

LITERARY NOTES.

The July number of the "English Illustrated Magazine" will contain a brief authorised statement of the remarkable conclusions arrived at by Professor Paul Vigum, whose book, "The Holy Shroud of Turin," has just been published.

✧ ✧ ✧

A large and fully illustrated life of Alexandre Dumas, whose centenary will be celebrated in July, has for some time been in preparation by Messrs. Dent, and will be published in this country and America. The author, Mr. Harry A. Spurr, has had the advantage of assistance from the Dumas family and of much critical advice.

✧ ✧ ✧

A statement has been published during the past week that a somewhat sensational volume of letters of Jane Welsh Carlyle is being prepared for early publication. These letters, which were collected by members of the inner circle of the Carlyle family, have been submitted, it is said. to Sir James Crichton Browne for reading and revision. Sir James has advsed that they should be published for the sake of the fresh light they throw upon the domestic life of the Carlyles.

✧ ✧ ✧

The influence of Kings and Queens extends to many of the minor things of life, remarks a contemporary. Before the accession of Queen Victoria, people who tossed with a coin usually cried "man or woman," an instance of which is given in the "Pickwick Papers," published in 1837. When Mr. Tupman and the "imperturbable stranger," Mr. Jingle, conceived intentions of going to the ball at Rochester, they tossed a sovereign for payment of the tickets, calling "man or woman," and it is stated "the dragon, called by courtesy the woman, came uppermost." Probably when the Queen's head figured on coins some confusion arose as to the term "woman," hence the popular cry became "heads or tails?" Will the King's accession bring about the revival of the almost obsolete term?

✧ ✧ ✧

A correspondent of the "Academy" writes—"The other day I came across a curious instance of perverted pity in the mind of a child. She was studying with interest an engraving of the well-known picture which has for subject the Colisseum by night after a massacre of Christians by wild beasts. The artist has chosen to depict the moment when, the show being over and the victims, it is to be hoped, dead, the animals are enjoying the hideous reward of their victory. One of them, for some unknown reason, has been compelled to forego his share in the horrible feast, and his dinnerless condition was the thing, and the only thing, that appealed to the child's sympathies. 'Oh, look at that poor lion over there,' was her remark, 'he hasn't got any!' I should be interested to know whether others among your readers have come across similar instances of misplaced sympathy." Perhaps some reader can cap this.

✧ ✧ ✧

Was George Sand in any degree beautiful? Mrs. Stepney Rawson, in her new novel, "Journeyman Love," makes a pretty picture of this lady's olive cheek and the dark and cloudy hair. But the romantic eye of Mrs. Browning was evidently troubled and surprised at finding George Sand far from lovely, and the great novelist was still in the prime of life at the time of her meeting with the admiring English poetess. In later years a correspondent writes:—"Not many days ago I lay in the room of a famous and hospitable Boston house, wherein Emerson, Hawthorne, Holmes, Thoreau, Lowell, Dickens, Thackeray had slept. It is almost papered with autographs and portraits, and amongst these hung the large drawing of George Sand, by Couture. The face is of a marked and known French type; a large face, inclining to bag, with eyes a fleur de tete—much more prominent than English eyes are apt to be, long features, a rather loose mouth, enclosed in the 'parenthesis' of Giordano Bruno. Much race, much character, but of beauty not a line."

✧ ✧ ✧

The late F. W. H. Myers records an amusing incident which illustrates the haphazard nature of most of these guesses at the originals of a great writer's characters. George Eliot and her husband were one day making good-humoured fun over the mistaken effusiveness of a too sympathising friend, who insisted on assuming that the dreary Casaubon was a portrait, and on condoling with the sad experiences which alone could have taught the author of "Middlemarch" to depict the horrors of marriage with so gloomy a man. "And there was, indeed, something ludicrous," adds Mr. Myers, "in the contrast between the dreary pedant of the novel and the good-natured self-content of the living savant who stood acting his vivid anecdotes before our eyes." "But whom, then," said a friend, turning to Mrs. Lewes, "did you draw Casaubon?" With a humorous solemnity, which was quite in earnest, however, she pointed to her own heart. Hence, it is logically evident that Dorothea was drawn from Lewes himself. One would hardly have suspected it.

✧ ✧ ✧

The position of a critical theatre-goer who has come to see a bad play at the author's invitation, and of course with a free seat, is one of some delicacy, but that it is capable of solution is proved by a story of Prof. Brander Matthews for which the "New York Times" is responsible. "Brander Matthews," says this authority, "received tickets for the first night. Did ever an author bring out a play in New York without sending tickets to Prof. Matthews? Contrary to his custom, Mr. Matthews made use of his passes on this occasion. He was down town; he wanted to see the play; so why not? The next day his opinion was eagerly called for by one of the classes at Columbia. 'Well, gentlemen,' said the literary free-thinker, 'the play was in four acts, and I was there as the guest of the author. After the first act the audience sat silent and I applauded. After the second act I sat quiet while the audience hissed.' The professor took a long-drawn and reminiscent pull at his cigarette, then held it at arm's length and flicked off the ashes. 'And the third act?' 'Well, gentlemen,' and there was a gleam of satisfaction in the professor's eye, 'after the third act I went out and bought standing room and came back and hissed too.'"

✧ ✧ ✧

A rather warm discussion has arisen at the University of Chicago from the statement made by M. Hughes le Roux, the French journalist, to an audience of students, that he was the author of "La Belle Nivernaise," one of the best-known of the shorter stories signed by Alphonse Daudet. M. Le Roux relates that when he was M. Daudet's secretary he studied his style, as did also many of his other young pupils. He referred to the fact that in the Louvre are many paintings by Rubens. These all bear the name of the master, and yet it is a well-known fact that many of them are the work of his pupils, who closely imitated him, offering their results to him from time to time for correction and advice and final revision, but doing practically all the labour themselves. One day Daudet came to him and said—"Le Roux, an American magazine for young people wishes me to produce for them a very moral story, which shall have for its central [illegible] such young persons of estimable character. Have you in stock such personages, and can you produce such a story?" He told his master that he would try, and the result was "La Belle Nivernaise." Such is M. Le Roux'e story, and opinions in America are divided on the question of literary ethics involved. It is a knotty question, and the efforts of the Denver "Republican" and New York "Evening Times" to solve it are not very helpful. This delegation of work has always been pardoned in great masters. Dumas practised it on a large scale. But it is certain that this is a kind of revelation to which people do not take very kindly.

✧ ✧ ✧

"The Hound of the Baskervilles" is thus advertised by its New York publishers, Messrs. Maclure, Phillips and Co.:—

Observe the Messenger Boy, how he Runs.
Is not this Unusual?
It is Positively Abnormal.
And its Cause?
He Goes on a Hurry Call for a Man—
To Fetch a Doctor?
—to Fetch a Book.
What Book?
The "Hound of the Baskervilles."
How Surprised and Gratified the Man will be to Get his Book so Soon.
He will Not.
Why so?
The Messenger Boy has Heard of that Book.
Well?
He will Dip into It.
Yes?
And See the Name of Sherlock Holmes.
And then?
He will Seat him on a Mossy Curb. And he will Read. And Read. And Read.
But the Man. What of Him?
He will Tear his Hair and Cuss.
Is that All?
No. Presently he will Rake up Another $1.25 and will Hustle to the Bookstore himself.
Wise Man.
Happy Messenger Boy!

✧ ✧ ✧

Which are the best fifty American poems? That is the question which is at present agitating literary America. It began with a list compiled by Mr. F. L. Knowles, and published in the "Boston Transcript." Mr. Knowles's aim was to produce an anthology "which should contain not more than fifty or one hundred short poems, but all of these untinctured by the least suspicion of mediocrity." Here is the list:—

"Thanatopis" (W. C. Bryant), "To a Waterfowl" (W. C. Bryant), "Israfel" (E. A. Poe), "To Helen" (E. A. Poe), "The City in the Sea" (E. A. Poe), "The Haunted Palace" (E. A. Poe), "To One in Paradise" (E. A. Poe), "The Sleeper" (E. A. Poe), "Annabel Lee" (E. A. Poe), "The Raven" (E. A. Poe), "Divina Commedia" (H. W. Longfellow), "Nature" (H. W. Longfellow), "The Skeleton in Armour" (H. W. Longfellow), "The Discoverer of the North Cape" (H. W. Longfellow), "The Problem" (R. W. Emerson), "Days" (R. W. Emerson), "The Rhodora" (R. W. Emerson), "Concord Hymn" (R. W. Emerson), "The Humble-Bee" (R. W. Emerson), "Each and All" (R. W. Emerson), "Skipper Ireson's Ride" (J. G. Whittier), "Telling the Bees" (J. G. Whittier), "In School Days" (J. G. Whittier), "Ichabod" (J. G. Whittier), "The Eternal Goodness" (J. G. Whittier), "My Playmate" (J. G. Whittier), "Hebe" (J. R. Lowell), "She Came and Went" (J. R. Lowell), "To the Dandelion" (J. R. Lowell), "Auspex" (J. R. Lowell), "The Courtin'" (J. R. Lowell), "Peace" (selection from Biglow Papers, second series, X.; from "Under the yaller pines I house" to "A nation saved, a race delivered"), (J. R. Lowell), "The Chambered Nautilus" (O. W. Holmes), "The Last Leaf" (O. W. Holmes), "The Living Temple" O. W. Holmes), "Old Ironsides" (O. W. Holmes), "When Lilacs Last in the Dooryard Bloom'd" W. Whitman), "Out of the Cradle Endlessly Rocking" (W. Whitman), "The Marshes of Glynn" (S. Lanier), "Bedouin Song" (B. Taylor), "Abraham Lincoln: An Ode" (R. H. Stoddard), "Battle Hymn of the Republic" (Mrs. Howe), "On a Bust of Dante" (T. W. Parsons), "The Venus of Milo" (E. R. Sill), "Columbus" (J. Miller) (C. H. Miller), "Echo Song" (T. B. Aldrich), "Sleep" (sonnet) (T. B. Aldrich), "Unguarded Gates" (T. B. Aldrich), "Sesostris" (L. Mifflin), "An Ode in Time of Hesitation" (W. V. Moody).

SCIENTIFIC TOPICS.

A new source of malarial fever has been discovered by one of the assistants of the Liverpool School of Tropical Medicine now at work on the west coast of Africa. Hitherto this complaint has been attributed to the bite of malarial mosquitoes, but the result of recent investigation proves that there is another parasite which is equally as deadly in the propagation of this malady. The new disease-bearer is said to resemble the insect which causes "fly disease" among horses in South Africa.

✧ ✧ ✧

G. T. Beilby and G. G. Henderson have exposed platinum, gold, silver, copper, iron, nickel, and cobalt to the action of ammonia at temperatures ranging from 400 deg. to 900 deg. In every case the physical effect of the treatment was to disintegrate the metal completely, while a large proportion of the ammonia was resolved into its elements. The fracture of metals which have been exposed to this action is spongy or cellular; under the microscope the metal appears as if it had been suddenly cooled while in a state of active effervescence. The penetration of the ammonia molecules into the metal is remarkably quick if the conditions are favourable. The absorption of small quantities of nitrogen by pure iron renders it hard and brittle like steel.

✧ ✧ ✧

Another monster now on exhibition at the Museum is a gigantic lobster, estimated to be the largest specimen in the world thus far recovered. It is a species of the common marine lobster, Homarus Amedicanus De Kay, and was caught of the Highlands, New Jersey, by fisherman. This immense crustacean measured nearly a yard in length and weighed 34 lbs. When first captured it was exhibited at the New York Aquarium, but only survived a few days. On account of its unusual size it was afterwards obtained by the Museum and mounted for permanent preservation. It now forms one of the most striking exhibits in the biological collection; it was also a prominent feature in the United States Fish Exhibit at the Paris Exhibition. Although of such extraordinary size, the lobster was quite normal in all its parts, being simply overgrown.

✧ ✧ ✧

The German explorers in Babylon have made an unusually interesting discovery. Inscribed tablets of clay are common enough, and examples of them are to be found in the principal museums of Europe. But in the excavations at Nischan-el-aswad 400 tablets have been discovered, many of which are of a novel character. Several of them may be considered of the belles-lettres class, says the "Architect." They were evidently used for teaching, and therefore may be regarded as presenting examples of the classic literature of Babylon. Some served as a dictionary, and on that account will be interesting to philologists. There is also a hymn which is chanted during the processions in honour of the god Mardik, whose temple has been brought to light by the German explorers. In another part of the same district the Temple of Adar or Ninev, the protector of physicians, has been discovered.

✧ ✧ ✧

A petrol motor has been fitted to one of the large boats at Lowestoft, employed in the North Sea herring fishing industry. The engine is of 24 nominal horse power, having three cylinders of 6½ inch bore and stroke, and a speed of 300 revolutions per minute. Economy of storage space is a marked feature of this type of motor, which is stowed in the cabin under the crew's table. Propelling the boat is not intended to be the sole use of the motor. It is also employed as a donkey-engine, to heave anchor, to hoist sails, and to work the pumps. The extremely small weight, both of the motor and the fuel to be carried, and the necessity for so few alterations in construction, make the adaptation of petrol motors to existing boats of this class a comparatively simple matter.

✧ ✧ ✧

A long critical article on the position of wireless telegraphy appeared recently in the "Koelnische Zeitung," which, as is well known, is one of the most influential papers in Germany. The agreement between the Marconi Company and Lloyd's is strongly criticised, and our contemporary asks if the Marconi Company and Lloyd's are really so naive as to think that the States in whose territory the signalling stations would exist would not oppose this "monopoly-greed." Our contemporary further asserts that the communication from the German Government on an international agreement on the subject of wireless telegraphy was not due to the refusal of the Nantucket lightship to communicate with the Deutschland, but that the subject had been moted some time previously. The article also compares the Marconi, the Slaby-Arco, and the Braun systems from a technical point of view, and claims that the two former have both adopted, in their system of transmitting, a method of which Braun is the original inventor and patentee. It suggests a combination of interests between the owners of the Braun and Slaby patents, who should fight the Marconi Company on the patent question. It will be remembered that the Slaby-Arco patents are owned by the Allgemeine Elektricitats Gesellschaft, and that the Braun patents are the property of Messrs. Siemens and Halske.

✧ ✧ ✧

The terrible news from St. Vincent, following the impression that this island had escaped the volcanic deluge which has cremated half Martinique, at once recalls and reverses (the "Academy" remarks) the famous hoax by which Daniel Defoe led all London to believe, in 1718, that the whole island of St. Vincent had been blown up and obliterated. On the basis of his own imagination, or on some thin ship story, Defoe wrote in "Mist's Journal" a circumstantial account of the destruction of this island, giving such details as, with all our facilities of new transmission, we wait for in vain to-day. After leading up very gradually to the catastrophe, he told his readers that, "on the night of the said 26th, about Midnight, the whole Island of St. Vincent rose up in the Air, with a most dreadful eruption of Fire from underneath the Earth, and an inconceivable Noise in the Air at its rising up, that it was not only blown up, but blown out of the very sea, with a dreadful force, as it were torn up by the Roots, or blown up from the Foundations of the Earth." Finally, to bring the event home to his readers he recalled an accident in a foundry in Moorfields, where a quntity of liquid gun-metal coming into contact with some water had blown up the works—just as a journalist of to-day might perhaps recall the recent distructive fire in the same district to suggest, however faintly, the storm of fire which swept over these hapless islands last week.

✧ ✧ ✧

The resistance which a flywheel offers to the air may give rise in some cases to a considerable expenditure of energy. Some tests were made in the Nurnberg central station which showed this very clearly. The station is provided with two tandem compound engines of 450 horse power, direct coupled to the dynamos and working at 95 revolutions per minute. In order to equalise the running with the great variations of load which occur, a very heavy flywheel was used with arms of a channel section. It was found that these arms offered a great resistance to the air, and created a powerful draft, and so it was decided to cover the wheel with sheet iron in order to reduce the resistance and thus gain considerable power. In order to test the amount of energy lost, the dynamo was made to run as a motor and thus drove the engine and flywheel at no load. When the latter had no protecting covering it was found to absorb 13,300 watts, but when the covering was replaced it took only 9,874 watts, thus showing a gain of 3,426 watts or 5.7 horse power, this being 1.2 per cent. of the horse power of the engine. Counting the current price per kilowatt hour and a day's run of 17 hours, it was found that this represented an economy of nearly £54 annually. Another test of a similar nature was made by M. Ingliss upon a 630 horse power engine and showed an economy as high as 30 horse power or 4.8 per cent. of the engine power which was gained by properly diminishing the resistance of the flywheel.

✧ ✧ ✧

President Henry Morton, of Stevens Institute of Technology, died on the evening of May 9, at the age of 66. A scientist of world-wide reputation, Professor Morton began his scientific career as an instructor of chemistry and physics at the Protestant Episcopal Academy in Philadelphia. He became a founder of the Philadelphia Dental College in 1863, and was first to hold its chair of chemistry. As an archaeologist, Professor Morton also distinguished himself. In 1859 he published a translation of the text of the Rosetta stone. While Resident Secretary of Franklin Institute and editor of the Institute's "Journal," he organised an expedition to photograph the total eclipse of the sun in Iowa. When Stevens Institute was founded in accordance with the will of Edwin A. Stevens, Professor Morton was made President. He held that position down to the time of his death. To Professor Morton's earnest efforts the success of Stevens Institute and the very high place which it assumed in the technological schools of America is largely if not entirely due. The interest which he took in the Institute is sufficiently manifested by his liberal endowments. He gave the Institute a mechanical laboratory fitted with steam engines and tools. Out of his own purse he furnished apparatus for the study of applied electricity and guaranteed the salary of a professor of electricity. When the chair of engineering practice was established in 1888, Professor Morton endowed it with 10,000 dollars, following this gift four years later with another of 20,000 dollars. In 1897 Dr. Morton received the degree of Doctor of Laws from Princeton.

✧ ✧ ✧

Quartz boulders and pebbles found in placer gravels are frequently reported to carry no quartz gold, according to "The Mining and Scientific Press." The condition is not universal, for placers are known in which the quartz boulders and pebbles do contain gold. The barren character of such float quartz is far the more common, however, and has been the foundation of many theories of formation of the gold found in the placers which excluded the idea of its coming originally from the quartz. The explanation of the seeming contradiction is simple. The gold in quartz is originally associated with pyrite and other sulphides. Surface percolating waters oxidise these sulphides and largely remove them, before the quartz, still containing the gold, by erosion of its overburden is itself in turn eroded and becomes placer. The quartz breaks up on its lines of least resistance, which are the lines where sulphides have been removed. The larger part of its original gold content is thus freed, and the separated quartz fragments are barren. In addition to the structural weakness of the quartz containing gold, its higher specific gravity constantly increasing as the fragment becomes smaller by abrasion, by retarding its downstream movement relative to quartz containing no gold, keeps it for a longer period of time under abrading influences. There are as well many quartz ledges that are barren of gold, and those ledges that do contain gold have barren portions. Such barren quartz, called "bull quartz" by the miners, is more resistant to disintegration than the gold-bearing quartz. It may thus happen that the quartz found in the gravels with the gold is not the quartz from which the gold was derived.

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1793.)

DUBLIN CASTLE, 20th JANUARY.

His Majesty, by Royal Letters, having been pleased to appoint the Right Hon. Edw. Earl of Kingston, the Hon. Denis Browne, and Sylvester Douglas, Esq., to be one of his Majesty's Most Hon. Privy Council of this Kingdom, his said Lordship, the Hon. Denis Browne, and Sylvester Douglas, in Council this day did take the usual oaths, and their places at the Board accordingly.

24th.—Michael Smith, Esq., took his seat yesterday as Junior Baron of the Court of Exchequer, in the room of Mr. Baron Hamilton, deceased.

Yesterday Tankerville Chamberlaine, Esq., took his seat as one of the Justices of the Court of Common Pleas, in the room of Mr. Justice Hellen, deceased.

The Hon. Mr. Knox, son of the Earl of Northland,, was sworn in yesterday one of his Majesty's Commissioners of the Revenue, before the Right. Hon. Barry Yelverton, Chief Baron of the Court of Exchequer, in the room of Gervais Parker Bushe, Esq., deceased.

Between seven and eight o'clock on Wednesday night last, a clerk belonging to Mr. Gibbons, public notary of the Bank of Ireland, was stopped by two footpads, near Mark's Church, in the lower end of Townsend street, and robbed of eighteen bills of various amounts which he had taken out for the purpose of demanding payment from the several persons on whom they were drawn. As all the bills were due, and notice given to the several persons on whom they were drawn, it is imagined no loss will thereby occur to the parties concerned.

DUBLIN CASTLE, JAN. 23, 1794.

His Majesty, by his Royal Letters, having been pleased to appoint the Most Noble Arthur, Marquis of Downshire, to be of his Majesty's Most Honourable Privy Council of this Kingdom; his Lordship, in Council this day, did take the usual oaths, etc., and his place at the board accordingly.

DUBLIN, FEBRUARY 4.

BARON POWER.

An accident occurred on Sunday last which affected the public in a high degree.

Mr. Baron Power, of distinguished eminence on the Bench, and not of less reputation as an intelligent lawyer, was also usher to the Court of Chancery. In right of his office large sums in contest were occasionally deposited in his hands for the security of suitors. In the contest between the Duke of Chandos and tenants, which so long engaged the Chancery, a large sum had been paid by the tenants, which, under an order of the Court, was to be invested in Government Securities—principal and accruing interest to be the right of the party who obtained the decree, which terminated after many years in favour of the tenants.

On adjustment of accounts, the usher, as in right of office, withheld the interest, which amounted to nearly £3,000. The tenants appealed to the Chancellor, who, struck with the equity of their claim, and which we have reason to think was still farther strengthened by an order of the late Chancellor, Lord Fitzgibbon, immediately directed the usher to appear in court to answer for his conduct. The Baron hesitated, if not refused, alleging his station as a judge, and holding a seat also on the same bench with the Chancellor, in the Court of Exchequer Chamber. The Chancellor was peremptory in his order, and most justly observed, that no person must or should hold a place in that court, where he presided, who did not give personal and immediate attendance when directed, and further fixed on to-morrow for the appearance of the usher personally to account for his conduct.

The Baron brooded in silence over the business. On Sunday, about one o'clock, he rode to the extremity of the South-wall, with calmness dismounted, and gave his horse to the servant, with directions to proceed slowly, and wait at Ringsend for his return. The servant returned, the Baron advanced to the new packet dock, and disappeared, after leaving his hat on the wall.

The servant waited till dusk, and finding no appearance, returned back, and could not get the smallest intelligence—not a trace, the hat excepted, which he immediately recognised. It was then supposed the Baron had taken a boat, and boarded some of the packets under weigh for England. These hopes all vanished when the body was discovered yesterday morning on the Strand, near the Pigeon House.

A jury sat upon the body. Verdict—Accidental death.

The Baron's fortune in the English funds was estimated at upwards of £60,000.

It is further said that the Baron left all his papers sealed up, and deliberately made his will.

TRIAL OF ARCHIBALD HAMILTON ROWAN, ESQ.

Wednesday last came on, at the bar of the Court of King's Bench, before the Right Hon. Lord Clonmell, and the Hon. Judges Downes and Boyd, the trial of Archibald Hamilton Rowan, Esq., on an information ex-officio, for a charge of having uttered and published on the 16th of December last, a certain libellous and seditious paper, purporting to be an address from the Society called United Irishmen to the people of Ireland—exciting them to discontent, jealousies, and sedition against the King's Government and the constitution of this realm, and calling them to arms, etc., with a seditious intent and purpose.

The crowds in the hall and every part of the court were unusually great. The following jury were sworn:—

Sir F. Hutchinson,
Thomas Sherrard,
Humphrey Minchin,
Richard Fox,
George Perrin,
John Read,
Frederick Trench,
George Palmer,
Richard Manders,
W. D. Moore,
Christopher Harrison,
Robert Lea.

The prosecution was opened by Counsellor Ruxton, and the case stated by the Right Hon. Attorney-General, in a most able and perspicuous address to the Court and jury, which continued above an hour and a half.

After hearing counsel on both sides, the jury, at a quarter before ten at night, retired, and returned a verdict in about five minutes of GUILTY.

The sentence was received by the auditors with much disapprobation, and the jury were hissed as passing from the box.

Mr. Curran and the Recorder then interposed on behalf of their client, that as he had all along pleaded by attorney, and done so in the trial this day, that their Lordship's could have no judicial knowledge of his being in court, and, therefore, it required a new process legally to take him into custody.

Lord Clonmell said, that the traverser being now convicted, and avowing himself present, he could not suffer him to be discharged, except the Attorney-General, or some of the Crown lawyers on the part of the prosecution, thought fit he should be admitted to bail. In that case he had no objection, as he would not receive sentence for four days.

The Crown Solicitor having attended for the Attorney-General, and refused to admit the traverser to bail, he was ordered into the custody of the High Sheriffs, and was afterwards escorted under a strong guard to the New Prison.

Counsel for the Prosecution:—
The Prime Sergeant,
The Attorney-General,
The Solicitor-General,
Mr. Frankland, and
Mr. Ruxton.
Agent—Thomas Kemmis, Esq., Solicitor for the Crown.
Counsel for the Traverser:—
Mr. Curran,
The Recorder, and
Mr. Fletcher.
Agent—Matthew Dowling, Esq.

FEBRUARY 4.

The candidates for the vacant seat on the Exchequer Bench are already suggested—The Prime Sergeant, and Mr. Day, Chairman of Kilmainham. The latter gentleman's spirit and exertions in promoting the emancipation of the Catholics, together with his exemplary and judicious decisions in his official department at Kilmainham, have equally rendered him a favourite with Government and the people.

5.—This day Mr. Secretary Douglas informed the House of Commons that, in pursuance of their order, their address had been forwarded to his Majesty by his Excellency the Lord Lieutenant, who had desired him to report to the House his Majesty's most gracious answer as follows:—

"GEORGE R.

"His Majesty returns his thanks to the House of Commons for their expressions of affection and loyalty, and their cordial attachment to his person, family, and Government.

"His Majesty receives with great satisfaction their congratulations on the failure of the attempts which his enemies have made to shake the stability of his throne, and to weaken the security of our happy constitution, and on the general success of his forces, and those of his allies, during the last campaign.

"It affords great satisfaction to his Majesty to find that the national Militia has been so successfully established, and that his faithful Commons are resolved to continue their exertions to prevent internal disturbances in Ireland.

"His Majesty is sensible of the zeal they manifest for the support of Government, by their assurance of granting him such supplies as the exigencies of the times and the honour of his Crown shall require; and his Majesty observes with pleasure, their resolution to persevere in their endeavours to improve the agriculture, the commerce, and manufactures, and in their support of the Protestant Charter Schools, and other public institutions in that kingdom.

"His Majesty feels justly gratified by the confidence they repose in his present Chief Governor, and by the sense they entertain of the advantages they have derived under his administration.

"G. R."

BRAY, CO. WICKLOW.

HOW IT LOOKED SEVENTY YEARS AGO.

(bridged from Lewis's "Topographical Dictionary of Ireland," 1837.)

RAY, a market and post-town, and a rish, in the half-barony of Rathdown, unty of Wicklow, and province of inster, 14 miles (N.) from Wicklow (by e sea road), and 10 (S.E. by S.) from ublin; containing 3,509 inhabitants, of ich number 2,590 are in the town. This ace derives its name, originally "Bré" "Bree," signifying a "hill" or "head-d," from the precipitous promontory of y slate and quartz, called Bray Head, ich rises immediately on the south of town to an elevation of 807 feet above level of the sea, and from the singular entation of its summit forms a well-wn land-mark to mariners. The nor, or lordship, of Bray, with all the itories of the O'Tooles, was granted, in 3, by Richard de Clare, Earl of Pembroke, lord-deputy, to Walter de Riddlesford, one of the earliest of the Norman adventurars, to be held of the Crown by three knights' service, to be performed at Dublin. This grant, together with the seigniory of Castledermot and extensive privileges, was confirmed to him by John, Lord of Ireland, who subsequently granted him an annual fair to be held at Bray, with free warren and other privileges. Among the earliest notices of this place is the record of a grant of a burgage, with a portion of arable land, to the abbey of St. Thomas, near Dublin, by the same Walter de Riddlesford, whose estates, on failure of male issue, were at his death divided between two co-heiresses: and in 1215 the abbot of St. Thomas obtained a grant of all the lands held by Walter de Riddlesford in fee, in the town of Bray, at a yearly rent of 3 and a fine of 60 marks. The town was frequently assailed by the mountain septs of the O'Byrnes and O'Tooles, to whose territories it was contiguous, and who, on the 16th of April, 1316, destroyed the castle; but they were on the same day attacked and defeated by Edmond Le Boteler. A fierce conflict took place near the town, in 1402, between these septs and the citizens of Dublin, headed by John Drake, their provost, on which occasion, according to Ware and Camden, 4,000, but according to Hervey de Malbrigge, 400 of the former were slain. At the dissolution of the religious houses, the possessions of the abbey of St. Thomas were granted to Sir Thomas Brabazon, whose descendant, the Earl of Meath, is the present proprietor in fee of the greater part of the town.

The town is situated on the Dargle or Bray river, which here forms a boundary

between the counties of Dublin and Wicklow, and after passing under an old bridge of five arches (this is the view shown in the accompanying illustration—Ed. D. P. J.), connecting the portions of the town which lie on different sides of it, falls into the sea a little below this place. That part of the town which is on the Wicklow side of the river consists of one long street of irregularly built houses, at the head of which are two smaller streets, one branching off on the left, from which the lower road to Wicklow is continued over the hill of Windgates; and the other on the right along the road to the Glen of the Downs, and together containing about 450 houses. That part which is in the county of Dublin is called Little Bray; it forms part of the parish of Old Connaught, and contains about 230 houses and cottages, and 1,168 inhabitants. The houses in both are in general neatly built, and the town has a cheerful and interesting appearance; it is neither paved nor lighted, but the road is kept in good order. The surrounding scenery is exceedingly romantic, and combines with its short distance from Dublin to render this place a favourite resort during the summer season for sea-bathing. On the Dublin side of the river a race-course has been formed, and races are held annually. The river abounds with excellent trout, which are taken in great quantities and sent to Dublin and different parts of the country, and even to London. By an inquisition taken in the reign of Chas. I., it appears, from various records, that the town had been in times past incorporated and endowed with many privileges. The church, a plain building with a small spire, situated on the verge of an eminence overhanging the river, was erected in 1609, and enlarged, by aid of a loan of £1,020 from the late Board of First Fruits, in 1818.

Besides the remains of the castle at Little Bray, there are the ruins of two others in the parish; one in the grounds of Old Court, consisting of a tower, with some fragments of the walls. Near these is a rude pyramidal block of granite, on which are some faint traces of ancient sculpture, which, from a print taken before it was so much mutilated, appears to have represented the sacrifice of a ram, on the top of it is a cavity apparently designed for the reception of a cross. The remains of the other castle, at Fassarow, which was demolished by Cromwell, are not in any way remarkable; coins of William have been found near them, on the road to Old Connaught, where is an ancient cross with a rudely sculptured representation of the Crucifixion. Under Bray Head are the ruins of an ancient chapel, 40 feet long and 18 feet wide; it is built in a north and south direction, with a circular-headed window at each end, and the doorway on the east side; and near the glebe land is an ancient burial-ground. On letelling a bank of sand near the sea, in 1835, to make an approach to the demesne of Mr. Putland, several human skeletons of large dimensions were discovered, lying regularly east and west, with a stone at the head and another at the feet of each, but which crumbled into dust on exposure to the air; several Roman coins of the Emperor Adrian were found at the same time.

KANAK MANNERS AND CUSTOMS.

Though the Kanak (South Sea Islander), may in ordinary circumstances expect honourable interment after his death, his cradle is a luxury which never existed for him. The poor little darkie who enters this valley of tears must first of all receive by way of welcome a baptism of smoke. All the grannies in the neighbourhood meet in the cabin, and the most worthy of them—the one who talks the most holds the baby over a great smoking fire while she pronounces an endless list of good wishes—"Mayest thou become a strong man, rich, a chief, and cultivate numberless plantations. Mayest thou navigate towards Nabanai, and bring back quantities of tambu," etc., etc. The happy father is obliged to pay for all these wishes of the old women, who, if the parents can afford a big reward, will prolong the baptism as much as they can. Only two months ago one of the poor babies died in the process. If the child is a first-born, the ceremonies are still more imposing. The cabin and all the little estate are decorated with verdure; here and there bits of stuff are hung by way of bunting. The near relations bring presents which the father has had to pay in advance. Visitors arrive from all sides, examine the baby, and feel him all over, trying to find in his poor little body good points in proportion to the amount of tambu which is served out to them. Much greater is the joy of the parents when a girl is born to them, for later on they will be able to sell her at a high price. A short time ago I heard of a young woman who was desperately disappointed at having a third baby boy, and no girl. With the consent of the family, she determined to get rid of it acording to ancient usages. Deformed children always died a few days after their birth, and doubtless by a violent death. Kanak mothers use a kind of shawl made of the fibre of the bread-fruit-tree to carry their babies in. This tissue is now often replaced by a piece of ordinary stuff. It is passed over the left shoulder and under the right arm-pit, so that the little one lies in a kind of pouch on his mother's back. When he gets a bit older he will have to stride across her haunches. In no case is a child caried in the arms. The European manner of carrying an infant excites laughter among Kanaks. As a consequence of the native mode of carrying children, the latter have curved thighs like old horsemen; as soon, however, as they can walk, their legs take a natural form. The imposition of a name takes place at the birth, or much later, according to circumstance. The name is a reminder of some circumstance attending the birth, or it is given in memory of a relation, living or dead. More frequently it is only a whim of father or mother.

LOW BAROMETER AND AURORAS.

M. Stazzano has heretofore noted several facts going to show that the aurora borealis is of terrestrial origin, that it is intimately connected with the phenomena classed as meteorological; and now shows from statistics that low pressures of the barometer are the most direct connection, auroras increasing in frequency with low pressures. They act not only to extend the aurorol zone, which, in both hemispheres, follows the line of polar pressure, but also the period of the low pressure influences both the diurnal and the monthly period of the aurora.

TO ENGLAND BY BALLOON.

ATTEMPT TO CROSS FROM IRELAND IN 1785.

ACCOUNT BY THE FIRST IRISH AERONAUT.

We give this week another page from the early history of ballooning in Ireland —viz., that which recounts in his own words Richard Crosbie's attempt in 1785 to cross the Irish Sea and to make a descent upon the English coast. The first report given of this essay was contained in some paragraphs in the Town and Country Weekly Magazine of 23rd July, 1785. In its department headed "Weekly Register of Historical Affairs," the reporter said:—

Tuesday last, at twenty minutes past two o'clock, Mr. Crosbie, the original Irish aeronaut, ascended with his new balloon, from Leinster Lawn, amid the acclamations of thousand of his applauding countrymen. This gentleman's spirited perseverance, in struggling through many difficulties, and having met with much unmerited calumny, marks his character for undaunted resolution and firm wisdom.

When Mr. Crosbie was preparing to ascend, the motion of his balloon caused much agitation in the minds of the spectators, it not ascending so immediately from the spot, as others we have seen; for on his outset he skimmed along the ground of the lawn, and slightly touched the parapet wall at the back in Merrion street, but happily without receiving any injury. Mr. Crosbie seemed to be perfectly collected; and observing the tendency of his balloon to come down in a field at the back of the lawn, with great presence of mind threw out a quantity of ballast, by which he at that instant majestically ascended eastward over the houses of Merrion square, and precipitately bore away. He continued in sight for near an hour, and seemed to be favoured with a wind that may gratify his long-fixed determination of landing with his balloon from hence upon British ground.

We are happy in announcing the safe arrival of Mr. Crosbie, though he has not as yet been able to effect (contrary to general expectation) his ardent desire of making an aerial voyage to England. Having proceeded half Channel over, he encountered with a current of air, which perceptibly carried him out of his intended course, to avoid which, and to obtain the benefit of the wind at a less elevation, he lowered the machine, when a heavy shower of hail, together with the attraction of the water, forced him into the sea, from whence he was taken up by the Dunleary barge, and arrived in town in excellent health and spirits. At four o'clock yesterday, the gentlemen who formed his committee, together with a great number of his friends, attended by a band of wind instruments, accompanied him from Leinster Lawn to the Castle, whither he was borne in triumph on the shoulders of the multitude, who gave the usual testimonies of their approbation. The Duke and Duchess of Rutland, to whom he intended to pay his devoirs, being absent at the time of his arrival at the Castle, the procession was continued from thence to his abode, while every mark of the public satisfaction at his safety was testified in his progress through such parts of the city as he passed.

Upon the publication of the above, Mr. Crosbie addressed the following note to the printer:—

Sir—As a circumstantial account of my last aerial voyage, on Tuesday, the 19th inst. may prove agreeable to my countrymen,

think it a duty incumbent on me to endeavour, as far as possible, to gratify their curiosity; and I trust it will not be thought too long, by the printer of a Magazine, who seems to have in view the same object in all his publications.—I am, sir, your very humble servant,

RICHARD CROSBIE.

Here is the "circumstantial account" referred to in the above letter:—

About five o'clock, the morning appeared so very unfavourable, that it was determined by the gentlemen of the committee, after due consideration, not to hazard the experiment; the wind was almost due south, and heavy squalls blew every moment. About eight it began to shift more to the westward, and at length to settle in one of the points mentioned in the advertisements; it was, notwithstanding, still thought imprudent to attempt filling the balloon, as the squalls, which were likely to continue, might do it some material injury, and be productive of a disappointment. The populace that were gathered outside of the lawn in great numbers, seemed to grow impatient, and the balloon was brought out in order to hoist between the masts, to try how far it was possible to begin the inflation with safety, and make an experiment on my apparatus, to convince myself that all was right, before I gave the appointed signals. About this time, near ten o'clock, some officious person in town fired a gun, which was immediately answered by others, and at length the signals became general. I had promised two hours notice, to which I was determined to be punctual, had it not been for the circumstances I have mentioned, which I fear rendered the spectators impatient. This I think necessary to mention, in order to plead my excuse, and claim their forgiveness. I judged the balloon would be ready to ascend by two, but from some little delay, the barometer I intended to have taken with me being broken, and the difficulty at the time of procuring another, it was twenty minutes past two before her Grace the Duchess of Rutland did me the honour of committing me to the air by cutting the cord.

At first my ascent was slow, and rather difficult, from having been misinformed as to the ascending power of the balloon, some of my friends, through their eagerness, pushing it up, while others, according to my prior directions, kept it down, when trying it. As I wished to have reserved all the ballast I could for so interesting a voyage, I threw it out so slow that it did not prevent the returning impetus, and my carriage struck with considerable violence against the ha ha wall which encloses the lawn on the side of Merrion street; here, with the assistance of the people, and discharging more ballast, I again ascended; but the balloon not yet in sufficient equilibrio with the circumambient air, struck against the ground in one of the fields opposite Merrion square, then gradually ascended, slowly throwing out sand, until I thought I had acquired sufficient power of ascent to gain proper altitude.

I now took a view of the astonishing scene was quitting, and after returning the salutations of the innumerable spectators along the fields, Strand, etc., to the seashore, I was highly entertained with a race composed of hundreds of horsemen, stretching with full speed along the Pigeon House wall, as if their course could not be terminated. I was now over the Bay, and, as I imagined, from the diminution of objects, that I was still ascending, I cast my eye on the barometer, which, to my mortification, I found had lost a considerable quantity of mercury, from the two concussions I had received against the wall and ground on my ascent. I, however, examined it, and as I found it fluctuate to the top of the tube, and of consequence proved the vacuum, I considered that it would answer for what at that time I was most interested in, merely to inform myself whether I was ascending or descending; that when I found a favourable current of air, I might be able to keep myself at the same elevation. I marked the height of the mercury with my pencil; and some time after one of the bladders that was in the carriage with me bursting with a considerable explosion, I looked to the barometer, and found it had fallen some inches. I marked the fall, and for a considerable period seemed to move in a favourable direction. I took out my pen, ink, and paper, to write down such observations as I could make, and to entrust to a more faithful record than thoughts what the glorious and unbounded scene around inspired me with.

I had written about a page when I felt myself grow very chilly, and put on an oiled silk wrapper, which soon brought on a glow of heat. I had two thermometers, one with mercury, and the other with spirits of wine; both had at this time fallen so low, that the mercury and spirits had entirely descended into their respective bulbs. (a) My ink was so frozen that I could not use it, until holding the bottle some time in my hand, its contents again became fluid. I at this time found the great advantage of my lower valve; for perceiving the smell of the gas, I was for a moment roused from the subject I was then committing to paper, and, looking up to the balloon, observed the valve open at short intervals with a sort of pulsation, and at each discharging the inflammable air in considerable quantities, The balloon was expanded to its fullest extent, and a number of bladders that were attached to my carriage exploded one after another, in some measure resembling hedge-firing.

Though the height was now so considerable that every cloud in the atmosphere was far below me, and nothing above but a blue expanse, I felt no sort of inconvenience or difficulty in breathing; but taking an observation from the line which the Lighthouse wall formed, though indistinct, and the Wicklow shore, which had appeared to my view beyond Bray Head, I found I was stationary, or nearly so, what little way I was making being to the southward; I was, nevertheless, so charmed with the enchanting scene before me, that for a while I forgot my enterprise; but the appearance of the British shore soon recalled me to myself, and observing the rack flying to eastward, as it seemed over the surface of the water, I opened my lower valve only, both to assist the efforts of the superabundant or compressed air to release itself, and to descend into the favourable current; in this I succeeded, and as yet had not parted with any ballast from the time of my ascent, though nearly half Channel over. I attentively watched the rise of the mercury, and observing it to arrive at the mark I had before made, when in the same stratum of clouds, I was in hopes it would stop there; but rising still higher, and the balloon consequently descending, I threw out four pounds of sand, when the mercury became settled, and afterwards gradually rose to the mark I mentioned. I now moved forward with considerable velocity, as I could perceive from some vessels that were holding the same course. I encountered a light shower of hail, and flying in all directions, which, however, soon passed off. Some humid vapour that had ascended with the gas into the balloon in the inflation, fell in large drops from the bottom, which wetted my paper and blotted my notes, while I marked them down. I attentively watched my time-keeper that I had laid on a bag of ballast in the bottom of my carriage. (b) My course now bid so fair for success, that I experienced more happiness and transport in the idea than I believe ever before fell to the lot of man. My mind, that was hitherto voluptuously fed, made me inattentive to the cravings of my appetite, which at length grew rather pressing, and with my pen in one hand, and part of a fowl in the other, I wrote as I enjoyed my delicious repast. A shower of hail darkening the surrounding air, now attracted my notice, as after some short period it seemed to ascend like a shower on earth reversed; from this I judged I was descending, and examining my barometer, the mercury had risen but a few tenths, which, after the shower had blown over, gradually resumed its former station, and I continued to move as before. I now had a distinct view of the two shores, and was drawing a rude sketch of the grandest and most awful scene that human eye ever beheld, when the report of a gun just under me, induced me to look over, and I observed a vessel ploughing through the surge with all her sails crowded; she appeared to me (only from the foam before her bow) to make little or no way; but looking exactly in the same direction with myself, I waved my flag and shouted, but was much surprised to find that my voice sounded to me as if my ears had been stopped; I afterwards felt some pain in each, which continued as long as I remained at the elevation I then was, though not considerable, and though I did not feel any at a much greater.

I passed this vessel, which proved afterwards to be the Dunleary barge, commanded by Captain Wallnutt, which had been kindly and obligingly sent out by the Right Hon. and Hon. the Board of Commissioners to attend me; and for about two leagues I continued to move horizontally; but another shower of hail coming on, and hearing the noise of the sea again, cast my eyes off my paper on the barometer, and found the hail was again depressing me; but not willing to waste my ballast, as I could not perceive the balloon had lost any of its power, unless when affected by these showers, and fearing the loss of weight would raise me to the same altitude wherein I had before lost my course, I reserved it until the increasing hail, or some influence unaccountable to me at present in any other manner, had brought me so near the water, that I took up a bag of 10lb., gradually spilling it out until the balloon again descended a little, its motion appearing like a vessel on sea in a heavy swell; but at every send, notwithstanding my incessant discharge of more ballast, it appeared nearer to the surface of the sea, until just as I seemed to overcome its descent, the increasing hail shower, and a violent squall of wind, precipitated me into the water. I was convinced I could ascend again from the peculiar construction of my carriage; when the shower was over, therefore, I was but little alarmed, as my legs only were wet; but unfortunately the cord that was attached to the lower valve was pulled out, which being of considerable dimension, and the repeated and violent squalls acting on the balloon like a hurricane, so much of the inflammable air was forced out, and of the atmospheric air got in, that after heaving out every bag I could get at, I found my efforts to rise ineffectual. In groping for ballast I found my cork jacket, which, from my reliance in my safety, I had not before thought of; I however now put it on.

My only hopes of rising were in heaving out my chain, as I knew the balloon would not suffer the same agitation if I could once ascend. I was resolved to try how far the loss of the chain's weight would effect it, at the same time not to lose it, unless necessary; to this end I took the chain in one hand (the other being engaged in holding the rope by which I was towed, that passed through a block opposite my rudder), and flung it out, letting the cord with which it was fastened run out with it at the same time; this, even bfore it could have descended to the extent of the cord, had no other effect than lightening the machine a few inches out

(a) The mercurial thermometer had a temporary scale constructed in a hurry, and the freezing point appears to be about 22 degrees above the bulb.

(b) My descent was so unexpected and sudden, that I never thought of securing my time-keeper or my notes, the latter of which were washed away, and the former (my own construction and work) effectually spoiled.

of the water, but not sufficient to raise it completely. I, therefore, though with undescribable mortification at being unable to fly, reconciled myself to the idea of being ignominiously towed to the other side, as I was drifting through the water with astonishing celerity. However, looking behind me, I observed a vessel crowding sail after me; but as I watched her a good while, I perceived she was losing way. The wind before this seeming to have spent all its fury, and was now become very moderate, it would have been ridiculous to have persisted in the idea, at that hour, of getting across the Channel, especially as I was not entirely in the direction for Holyhead. I, therefore, in order to lie to, paid out a considerable length of cord with my chain, which staid me so much, that at 47 minutes past three o'clock, the barge (the same I had passed some time before, and had fired the gun) came up with me, after being at perfect ease (but from wet) upwards of 26 minutes in the water, and about ten leagues from Howth. Having secured my balloon and carriage to one of their hawsers, I got on board, and discharging the remaining gas from the balloon, we got it upon deck, and steered our course for Dunleary, where, as we were becalmed some hours, we did not arrive until four o'clock on Wednesday morning. The mortification I felt at not accomplishing my intended voyage was greatly mitigated by the almost undoubted certainty and safety which I have every reason to conceive, there is in crossing the Channel, on any particular occasion, with a proper wind and good weather, and by the flattering hopes of again being able to attempt and succeed in my undertaking on a future day.

DEEP SEA LIFE.

Results of deep sea dredgings are different in different oceans. A series of experiments made in the Aegean Sea, which is a part of the Mediterranean, seems to establish the fact there was an abundance of life in the shallow water, which diminish till it found a limit at 300 fathoms, below which no life seemed to exist. It was afterwards shown, when repairing a cable on the coast of Africa, that animals were attached to the cable that had been lying at a depth of 1,200 fathoms. This, however, was exceptional for the Mediterranean. Both the English and American Governments have made extensive research in the bottom of different oceans, with very interesting results to science. It is proved by these dredging that there is abundant life in the Atlantic Ocean as deep down as 2,500 fathoms, or nearly three miles. One result of these soundings was to establish the fact that there were currents reaching to great depths moving in opposite directions, with fifteen degrees difference of temperature within a short distance.

The Mediterranean seems to be an exception to the general rule in the matter of deep sea life. The reason is found in the fact that there is a slimy sediment in the deeper portions of this sea that interferes with animal respiration, the same as an extremely thick dust would in the air. Life is supported in the water the same as on land—by breathing oxygen. In the one case it is absorbed from the air and in the other from the water. Pure water is to the sea animal what pure air is to the land animal. The sea animal could not live in muddy water continuously any more than we could exist continuously in an atmosphere filled with dust. It is thus seen that depth is not the only condition that affects animal life on the bed of the sea. The nature of the soil and deposits are factors, as well as the temperature of the water. However, there are certain forms of life to be found in the lowest temperatures. But as is the case on land, we do not find the same kind of life in the colder and deeper zones of the ocean as in the warmer and more shallow parts.

In the cold waters the animals are dwarfed in size, somewhat as we find them in high mountain regions. It is said that the starfish will grow as large as a pudding plate where the conditions are favourable, but not larger than a silver dollar in the cold current of the Atlantic, which flows southward. In some places this cold current falls 2 to 2½ degrees below the freezing point of fresh water, at the bottom of the ocean.

KNOCKFIERNA.

DISCOVERY OF THE BIRTHPLACE OF FINN M'CUMHAILL

By J. F. LYNCH.

II.

Mr. W. M. Hennessy (Introduction to "Mesca Ulad," p. vi.), says: "Temair Mairci, where, according to Leb na h-Uidhre, 42, b, the celebrated Find Mac Cumaill was born and nursed. It was probably in Sliabh Margi (or Sliabh Marague), in the Queen's County."

The passage referred to by Mr. Hennessy is given in "Irish Grammar," by Professor Windisch, p. 140, where it is stated that Conn of the Hundred Battles ordered Muirne to go to the house of Fiacail, son of Cuchenn, at Temanr Mairci, for Fiacail's wife, Bodball Bendron, was sister to Cumall, the husband of Muirne, and father of Demne, afterwards named Finn. At Temair Mairci, Demne was accordingly born. In the "Boyish Exploits of Finn, no mention is made of Temair Mairci, but it is stated that after the birth of Demne, Fiacail, son of Cuichenn, Bodhmall Bandrai (or Druidess), and Liath Luachra came to Muirne, and carried away Demne, for his mother durst not keep him with her. The account given of Liath Luachra, (a) in the "Boyish Exploits," is very curious; he is stated to have been the keeper of the round bag of the jewels of Cumall, and to have been the first who wounded Cumall in the battle of Cnucha, and to have departed with the round bag of jewels which he had in his possession, when slain long years afterwards by Finn. It is also to be noted that Bodball Bendron is named Bodhmall Bandrai in "Boyish Exploits." Temair Mairci signifies the tara, or "prospect hill," of Marc, or Marg, and was, it appears to me, the old name of Cnoc Firinne. In "Silva Gadelica," p. 529, a Cuchenn, son of Dedadh, is mentioned, and his residence appears to have been south of, and not far from the residence of Asal, son of Umor, on the hill now named Tory hill. In "Silva Gadelica," p. 166, Liath Luachra is stated to have been son of one of the plebeian men of Ara; and in the list of De Danann chiefs, given in "Battle of Ventry," the three Liath Luachra are mentioned, and correspond to the three Mais of Sliabh Luachra of the list in "Pursuit of Dearmuid and Grainne." In the "Book of Rights," p. 87, there is a list of the royal forts of Munster, and in this list, and in following order, we have Cathair Chinn Chon, Dun Fir Aen Cholca, Cathair Methais, Dun Gair, Temair Subha. Cathair Chinn Chon, (b) or "fort of hound's head," is said by O'Donovan to be near Rockbarton, the seat of Cahirguillamore, now of Lord Fermoy. The site of the fort of Cahirguillamore is marked on the new Ordnance Map, and Cahirguillamore, and Cathair Chinn Chon, are probably the same. Dun Fir Aen Cholca, which means fort of the man of the one (or wonderful) sword, is about a mile to the east of Cahirguillamore, and on the hill of Buile na g Cuillech, at south side of Lough Gur. Dun Gair, or fort of Gar, was on the summit of Knockadoon, or hill of the fort (of Gar), a short distance to the north of Dun Fir Aen Cholca. According to the people, the "fear" was a giant, and his sword was of gold. On the western pinnacle of Knockfinnel is site of a stone fort, and this fort appears to me to have been Cathair Meathais, or fort of Meathas, or Methas, and probably Mas and Meathas are the same; and as mas means excellent, handsome, perhaps Methas has the same meaning, and so the word mas may have reference to Liath Luachra. It has for a long time been my opinion that there were two places named Temair Luachra, and that the western Temair Luachra is merely a shadow of the real Temair Luachra, or Knockfinnel, at the west side of Lough Gur.

Hennessy says that O'Donovan identifies Temair Subha with Temair Luachra, but without authority, and he evidently regards the identification as incorrect. From the position of Temair Sabha, in the list in "Book of Rights," it appears that Temair Subha must be not far from Lough Gur. South of Knockroe there is a townland named Ballyhoodan, which is an old name, as it is mentioned in State Paper, dated 1243, as one of the de Burgh manors in Munster. Ballyhoodan may be in Irish Baile Shubhdain, or place of Subdan; and as Temair Subha is Tara of Sub, the name Subdan may be extension of Sub. The two forts which succeed Temair Subha in the list are Ard Bile and Aenach m-Bearrain. The old name of Isert, or Disert Lawrence parish, which bounds Ballyhoodan on the north, is Tristilaverrane. This name occurs in State Paper dated 1243, and the place was one of the de Burgh manors. Tristilaverrane is corrupted from Disert an bhearrain. Bearran may mean "little summit," at western end of the Knockroe, and in "Isert Lawrence," there is a little summit which is the site of one of the strongest stone forts in the district, and which is now called Shanacuart, or "Old Court," and this may be Aenach m-Bearrain.

I have given these particulars in order to show that Ara district was a most important one in the pre-historic period, and consequently that the identification of Cnoc Firinne with Temair Mairci is not one to be brushed

(a) Cathair Chinn Chon is mentioned in Chronicum Scotorum, at year 639 A.D., as scene of a great battle, in which Maelduin, son of Aedh Bennan, King of Munster, was defeated. South of the site, and not far from it, is a great pillar stone, with respect to which the fort was probably named. Compare the name Ath Chinn Chon, now Kinnegad, according to O'Curry, "Lectures," p. 487, and the name, Rath Chinn Chon, "Silva Gadelica," p. 235. Compare also the account given in "Silva Gadelica," p.p. 236-237, of Raithin na ningnadh, and of the wonderful hound, which may, perhaps, have some connection with the tale of the gold found in the city of Hound's-head. North of Cahirgullamore is a townland named Raithin, which is mentioned in State Paper, dated 1200 A.D.

(b) In "Bodleian Dinnshenchas," p. 11, Liath is stated to be son of Celtchar of Cualu, and in "Genealogy of Corca Laidhe," p. 63, the Uaithsthire and Uaithne-Cliach are stated to be descended from Celtchar, son of Uitheochar. Uaithne-thire and Uaithne-Cliach are the baronies of Owney and Arra, and Owneybeg, in counties of Tipperary and Limerick. The Uaithne were the four tribes of O'Hifernain, Muintir Loingsigh, O'Cathalain, and Mag Ceoch (See O'Heerin's Topographical poem). Celtchar was one of the heroes of Craobh Ruadh, and gave name to Dun Celtchair, a very large fort near the town of Downpatrick. (See "Book of Leinster," 66a, where he is called of Leth glais, another ancient name for Downpatrick ("Battle of Magh Rath," p. 207).

aside on account of the non-importance of Ara district. Some time ago I wrote to Professor Rhys suggesting that Ivernis of the Iverni or Iberians, mentioned by Ptolemy, was beside Lough Gur, and Professor Rhys said, in reply, that he considered this identification as highly probable. Some months after this, when looking through an old volume of the "Trans. R.I.A.," I came upon a letter written by William Beauford, (c) from Athy, Jan. 2nd, 1790, in which he discusses Ptolemy's account of Ireland. Beauford's note on Journis Edit. Pal. Iernis is, "according to Richard of Cirencester, there were two Ibernia; one he places on the east side of the Shannon, the other on the Blackwater, the port of Insovenach. The former being an inland city, was most probably the Journis of Ptolemy, and thought by Whitaker to be Cahir, near Bruff, in the county of Limerick, where there still remains some raths, cromlecs, and other monuments of antiquity."

The Cahir is Cahirguillamore, and the old people of Lough Gur say that Cahirguillamore was formerly a great city; and it was probably on account of this tradition that Whitaker identified Cahir with the Iberian "city." Lewis, in his article on Tullybracky, says: "Round Rockbarton are numerous vestiges of antiquity, but the most remarkable ruins are those in the demesne of Cahirguillamore, which indicate the former existence of an ancient city of great extent; the sites of streets, gates, and fortifications are still to be traced, extending in some places into the adjoining parishes, and connected with the ancient forts on several of the surrounding hills."

The old people sometimes called Cahirguillamore as Cahirguillamoreveety, (d) that is, Cahirguillamore of the Whites, and in one of Queen Elizabeth's State Papers it is mentioned that the last Earl of Desmond leased the lands of Cahirguillamore to Richard White, a member of the family, who built Cahirnarry Castle, near Ballyneety (town of the Whites), and old Tullybracky Church, and Castle. The people tell a curious story—that a Mr. Hayes, ancestor of Mr. S. Hayes O'Grady, author of "Silva Gadelica," found a cauldron full of gold near the city, and therewith were built Rockbarton and Cahirguillamore Ho. The hole where the cauldron was found was pointed out to me, and I was also told that there is still some gold in the hole, but that it is guarded by a supernatural guardian; and as the gold is not visible by day, the guardian must be encountered by night.

One thinks of the old Greek tale of the sacred gold guarded by the griffons. I searched Cahirguillamore Park, and could find no trace of the city; but the people say that the first Lord Guillamore made many alterations, and that Cahirguillamore Ho. and Rockbarton Ho. were built with the stones of the city, as was also the wall of the deer park. The city may, perhaps, be the city, at the bottom of Lough Gur, which General Vallancey terms the great cirgor, that was overwhelmed by the waters which burst from a sacred well, when Lough Gur was formed. Lough Neagh was formed in the same way; for Liban, the daughter of Eochu, who guarded the sacred well, went acoortin', and so Lough Neagh, or lake of Eochu, was formed. The lake legends of Ireland are very interesting, and of extreme value, but they must be treated as legends; and from the legends, both oral and written, must be pieced together the extremely complicated mythology of the ancient Irish. The late Professor Max Muller appears, towards the close of his life, to have recognised the value of the old things of Ireland, for Mr. W. C. Borlase says, in the Preface to "The Dolmens of Ireland," that he was advised by his friend, Professor Max Muller, to go to Ireland to examine the Irish monuments, and to hear the Irish tales.

J. F. LYNCH.

(c) In an early volume of "Trans. of R.I.A.," there is an article by William Beauford on the stone circles at west side of Lough Gur, in the townland of Grange, or Nova Grangia. This is the earliest account of the Lough Gur monuments. In the "Gentleman's Magazine," Feb. 1833, there is a paper by T. Crofton Croker on Lough Gur; and Croker's "Tale of the Enchanted Lake," refers to Lough Gur; and in "Galloping O'Hogan" there is also a very valuable tale of Lough Gur.

(d) Mr. John Hayes, of Lough Gur, whose father lived at Raithin, told me that he heard the celebrated John Collins, of Myross, call the place by this name. John Collins, who was regarded by O'Donovan as a great authority on the Irish language, often visited at the house of Mr. Hayes, at Raithin; and Mr. John Hayes has an Irish manuscript, which is a copy made by his father from a manuscript belonging to John Collins. The identification of the fort of Cahirguillamore (Cathair Ghoill Mhoir)) for present Ordnance Map is due to Mr. John Hayes. I thought that Cahirguillamore was just beside Cahirguillamore House. On old Ordnance Map a stone circle is marked close to the pillar stone of Cahirguillamore, but Mr. Owen Bresnan has informed me that this monument is not a stone circle. I did not examine it when I visited Cahirguillamore.

DO FISHES SUFFER PAIN

All fishes have nerves, and in some respects fishes are extremely sensitive. A fish that has buried itself in sand or mud so completely that only the tip of its tail fin is above the bottom will feel upon the slightest touch and instantly dart out of its sandy bed. A fish is very sensitive to movements in the water surrounding it. A shadow falling upon the water will startle a fish into flight. But sensitive as fishes are in some respects, it is probable that they do not suffer pain from injuries received.

Fishes are extremely sensitive at the nose. A fish that had in pursuit of prey run its nose against a rock might shake its head violently, perhaps in pain, but fishes sustain serious injuries from actual wounds without showing any indication of pain. In fact, the indications tend to show that they do not suffer.

A fish that has been hooked by an angler, but has escaped, perhaps carrying off a hook in its mouth, may a few minutes afterwards bite again at another hook. Such instances are not infrequent. In such cases the hook would probably be concealed by the bait and the fish would not be likely to see it, but the fact that it is ready to take the bait shows that it is continuing to feed, which it would scarcely be like to do if it were suffering great pain. A shark from whose body all the viscera had been removed has continued to feed.

Sensitive as fishes are about the nose, many of them use the nose in pushing stones and gravel about in building a nest for the female to spawn in. The salmon notoriously often wears its snout down to the bone in excavating a cavity for a nest, and often it wears off its tail to a mere stub in brushing out stones and gravel. Yet such fishes frequently recover from their injuries and return to the ocean.

Timid and sensitive as fishes are in some respects, they fight one another vigorously. In such fights they may receive injuries that might be described as terrible. To these injuries they may pay so little attention that after the fight is over they go on with their feeding or with whatever occupation they had been engaged in.

Injuries which would throw a human being into a state of helplessness do not interrupt the current of fish life. The fish may afterward die from its injuries, but apparently it does not suffer pain from them.

Fishes sometimes survive injuries of a remarkable character. The stomach of a captured codfish was found to be pierced by a spine of a flounder which it had swallowed. The sharp, thornlike spine projected about half an inch beyond the outer wall of the stomach into the fish's body. Apparently the codfish had suffered no inconvenience from this. The wound caused by the spine had healed around it, and the codfish was fat and in good condition generally.

AT LOVE'S DOOR.

I heard a sound, in the deep of night,
Unlike aught heard before;
It was a lost heart knocking at Love's door.

I saw a sight in the dawning light—
May I not see it more!
It was a dead heart lying at Love's door.

OUR WEEKLY STORY

BOB'S VARIOUS.

BY K. F. PURDON.

They were biking, one pleasant summer afternoon, along a hilly road in Wicklow. Both had racket and tennis shoes strapped on in front; both were straw-hatted and white-flannelled, and both had been christened Robert. But there the likeness ended—in the opinion, at least, of the elder of the two youths. He was never spoken of except by his full name, Robert. Robert Olive MacKenzie he liked to sign himself. His parents had died, when he was an infant, in India, and it seemed to strengthen the hazy idea that such a circumstance favours, of some connection with the army, that he should adopt the name of the hero of Plassy and Arcot.

The other Robert, his cousin, was just Bob—Bob Mac his many friends called him.

"I can't imagine," Robert was saying, as they slowly pedalled up a long hill, "I can't imagine how any man would hesitate about his profession—if he were free to choose—I really can't!"

"Why can't you" asked Bob; and he asked the question with an air of trifling calm that Robert felt justified in considering stupidity—worse—it seemed as if Bob wasn't paying attention, or taking the trouble to understand him—he evidently was thinking of something else—and he, Robert, actually trying to educate him up to his own lofty standard! But he curbed his wrath. "Because," he pronounced haughtily, "there is only the one profession."

"Oh, yes, there is more!" cried Bob cheerfully. "A chap can be a parson—I don't think I could mind you! or a lawyer, or lay railways, or eggs—I mean up-to-date farming, you know—or a doctor——"

"Yes!" said Robert, almost snorting in his fierce contempt; "and so you've stuck yourself down to roll pills and spread plasters, when you might spend your muscle fighting for Queen and country! I'd take the shilling myself, and chuck the Bank, only for," and here Robert smiled—a meaning smile—half sad, as who should say, "Well, well, we are all human—even I have my weak side—poor little Nettie!"

"Ah, the army!" said Bob; and really his tone implied that quite a new field of thought was being opened to him. "I don't think I'd like that!"

"Not like it! and why, pray?"

"I might get shot," said Bob, simply.

Robert cast one stern glance at his companion—a silent glance it had to be, for his feelings were beyond words. And I think Bob deserved some credit for the cheerful equanimity with which he sustained that awful gaze.

"A chap might start inventing new names—I believe there'd be money in it, do you know! They're all used up—there's no variety. It would save no end of confusion. Now, look at you and me——"

"You needn't worry over that!" said Robert; "no one is likely to make any mistake there!"

Of course, Bob might have replied witheringly, "Thank goodness!" or "I should hope not!" But he never could think of things to say till the next morning—and repartee is like soda-water—for immediate use only. So he just said—they had got to the top of the hill—"You're never going to coast down this side"

"You needn't, if you're afraid!" was the reply, as Robert put up his feet and whirled off.

"A pity he's such a blithering idiot," thought Bob, following more slowly; "he's not so bad if he wasn't such an ass! And no brake on that old grid of his! And the turn half way down; and it's a lot steeper after that, and you never can tell what other fool may be coming along the bog road, and just run into you at the bottom. By Jove! he's done for! or somebody is!"

Bob slackened his laborious back-pedalling, and shot downward. He rounded the curve, and beheld the great Robert sprawling ignominiously at one side of the road, while at the other, a white mule, that had evidently just been emerging from the bog road, was trying to kick itself free from the trap to which it was attached, and at the same time backing stubbornly towards a yawning bog-hole at the side of the rough roadway.

An old lady, seated in the trap, was uttering shrieks of wrath and terror, alternated with contradictory orders to the girl who held the reins. With Bob the climax arrived. The second bike was the last straw for the mule, who determined to bolt for home. He made one wild plunge forward, tried to turn, and fell. Bob, who had sprung off and let his bike roll away, promptly seated himself on the mule's head, and the two women got out.

"Oh, what an escape!" said the old lady. "If you hadn't come up, Mr. Bob, I don't know what we should have done!" and she looked indignantly at Robert, who was on his legs again, and was smoothing down his ankles in a military way, and trying to look collected. Robert was what is sometimes called highstrung—Bob was not. Their friends said of the cousins, that when Robert got in a tight place he stuck, whereas Bob was "all there."

"Oh, that's all right," said Bob, hastily cutting short the impending thanks. "The brute got a bit beyond you, didn't he, Miss Nettie"

"What could you expect," demanded the girl. "It was enough to startle anyone to see a Thing whirling madly——"

"Oh, it's just mulish cussedness," said Bob, soothingly—"they hate bikes——"

"What do you propose doing?" asked Robert, majestically; "you're not going to spend the evening sitting on the brute's head?"

"Why, indeed, should he?" exclaimed Miss Nettie, vehemently, "it wasn't his bike."

"Come and undo some of these buckles," said Bob. "No, hang it all, man, not that one."

Bob had a kind of instinct about all things practical under his directions. Robert managed to loosen the business part of the harness. Bob jumped up, and the mule followed suit.

"What are we to do now?" asked the old lady, "we ought to be at the Deverell's now."

"If it's not too far for you to walk," said Bob, "I'll lead this fellow back to his stable. I don't think you ought to try driving him again this evening."

"No, indeed, but you'll miss the tennis!"

"Oh, it doesn't matter," said Bob, "it's of more consequence about Robert, he plays so well," he added aside to Nettie. She looked rebellious at this arrangement, and Bob, who had suggested it in all good faith, felt cheered as he marched off with the mule.

"I can't pretend to understand that class of brute," said Robert, as he sauntered off with Nettie and her aunt. He believed he would feel at home on a charger.

"Lucky your cousin does!" said the old lady, and they strolled on in silence.

Nettie was soothing her ruffled feelings, by calculating how long Bob would be delayed. He might reach soon after them—he was very quick, she reflected.

Robert, on the other hand, did everything with a slow majesty that was distinctly impressive upon first acquaintance. There was a long pause now, and he broke it by saying in the deliberate, mysterious voice that implies more behind, "Bob means very well—he is often quite useful."

"That unsolicited testimonial is most flattering," said Nettie. "A fine, manly young fellow," said Nettie's aunt, tentatively. She was out of play herself, of course, but she took a keen interest in the game still. Girls' aunts often catch a good share of reflected excitement in that way. Like the "hurler on the ditch," too, they generally see most of the fun.

There was a short silence, and then Robert spoke again.

"Manly, did you say? Well, I don't know if that exactly fits a fellow who's afraid!"

"Afraid of what?"

"Afraid of being shot, if he went into the army!"

"Oh, I don't believe that!" cried Nettie—a simple statement enough but a powerful rejoinder. For if a person doesn't believe what you say, why, there you are, and you get no forrader, as the farmer said of drinking claret.

But Robert was so possessed with righteous wrath, that he ignored this speech altogether—another strong position to take up in argument, and went on, "I wouldn't have believed it, and of my own cousin, too, only he told me so himself just now."

"What!" cried Nettie's aunt, in a tone as horrified as if she had just heard that the Queen had gone on a visit to the Vatican, or that Kruger and Mr. Rhodes had started ostrich-farming together.

"He said," Robert explained solemnly, "that he wouldn't like to go into the army—that he might get shot!"

"Dear me, dear me!" said Nettie's aunt, almost groaning in sympathy, at the same time pressing Nettie's arm, which she held, for silence.

Robert went on in the same suppressed tone: "Afraid! afraid of being shot! Can you imagine a man saying such a thing! Why, it's the most glorious death——"

"Oh, bosh!" Nettie broke in, "talk about something pleasant, do! Be amusing—if you can."

Robert fell back into dignified silence. Nettie caught the quiet twinkle in auntie's eye, and was soothed.

A few weeks passed, during which it happened that the Bob's did not see one another. When next they met, it was in Grafton street, Robert fiercely war-like in kharki.

"Hallo, old man," said Bob, "going out?"

Robert nodded. "Next month—Lord L's troop of yeomanry."

"Well, good luck, and a V.C. to you," said Bob. "South Africa's pretty roomy; but maybe I'll see you there. I'm going too."

"What!"

"Yes, with the I. Hospital—lucky for me, isn't it?"

It wasn't exactly luck, that Bob had been chosen from among so many volunteering young medicos by the great surgeon who only wanted men he knew he could rely on. But when Robert remarked kindly, "You'll be safe enough, you know, under the Red Cross," Bob accepted the remark without comment.

"You'll do first rate, Robert," he said, "after all your military training."

Robert nodded stiffly, slapped his riding-breeches with his whip, and stalked loftily on.

But the little knowledge of the militia man is often a dangerous thing. Like many another, Volunteer Robert had plenty of pluck, but very little discretion, and still less sense of discipline.

During a long, fierce struggle for a kopje, where he had to lie still till ordered to advance, the inaction became unbearable. He thought he saw his chance.

A gun a few hundred yards off had been silenced, the men shot down; unless an effort were made, it would be captured.

Robert's heart beat fast. He saw the V.C. within his grasp. Despite the warning, more emphatic than polite, of a more wary comrade, he stood up from behind the boulder where he had been posted.

Hardly had he done so, when, with a sharp ping, something happened, and down he went, with a bullet in his thigh.

It seemed days long, that he lay there, with rattle and din and shouts around him, his only company the horrible pain, and the heat, and thirst, which seemed unbearable. He dared not move, even if he could have done so, for it would mean drawing the Boer attention on himself again.

Bullets were still simply raining around the bare, stony hill, when some one came up and stooped over him.

"Never mind me," he groaned—Robert really had some grit in him—"get under cover yourself."

"Robert!" exclaimed a well-known voice. "So it's you!"

"I'm done for Bob! Good-bye!"

"Not a fear of ye, old man; you're worth ten deadens this minute! Here, let's have a look," and Bob, as coolly as if he had been in the operating room at home, began to examine the wound.

"You'll only get potted, too; those brutes can see anything, except the Red Cross—and they can always hit that, too!"

"Let them shoot away, and be hanged to them," said Bob. "Here, that's all I can do for you now. I'll drag you round further a bit, if you can stand it. You'll be safe enough here till I can get a stretcher out for you, when the firing's over. I must go on to the next chap—he doesn't hear me, poor Robert; hang it all, he's fainted—it's the heat."

But the blessed unconsciousness only lasted till the removal over the rough hill-side began, and then there was fever. Robert's was one of the tedious cases, whereby the patience of doctors and nurses are sorely tried. They like to get through quickly—kill or cure—and naturally, with such an unending stream of suffering to be handled.

At last Robert fought his way back to conscious life. His memory was a blank; he was sorely puzzled to find himself in one of a number of narrow beds in a huge, cool building, that not only looked like a church, but was a church, commandeered for hospital purposes.

Everything was very still, and neat, and clean—the scent of flowers was in the air.

A nurse heard him stir, and came over at once.

"Well," she said, with her professional brisk kindliness, "you're better now? You know me to-day, don't you?"

"I suppose so," said Robert, faintly—"but I don't know how I came here!"

"Ah, it was just like so many others, only worse, for the fire, while they were attending to the wounded on the field, was simply awful! They're all talking about the young fellow who worked at your corner, and say-

ing he ought to get the V.C. When you were being lifted into the cart, they found he had shaded your face with his own tunic, and gone off without even the Red Cross on his sleeve—not that it makes much difference! Bob Mac they call him, and they say he is as kind and gentle as little Bobs, and as daring as Mac. He got wounded himself—came near losing an arm—but he's nearly all right again. He'll probably be sent home in charge of the next invalid ship, and very likely you will go then, too."

So it came about that, when next the Bob's met, they were on sea, and again there was little in common between them.

Bob was busy and full of energy, devising all manner of things for the comfort of his patients, while Robert could do nothing but lie still and think. There is abundant leisure for that on board ship at any time, for a passenger that is. And when, perforce, you don't stir, because you haven't strength to move—well, then, you enjoy many salutary reflections, such as are apt to come when you realise what a fleeting possession is the health you have regarded with the ungrateful indifference of life-long habit, when you can't hold a cup to your own lips without danger of letting it fall—when a suden noise makes you start and tremble—when a fancied slight makes you cry like a child, with pure misery and weakness.

Robert was in this stage on deck one day. A pillow had slipped, and he couldn't for the life of him settle it, and he thought he was being neglected, when Bob came along.

"Well, Robert, old man, how're you making it? You look a lot better already. You'll be as fit as a fiddle by the time you land. You look as if you wanted something, though. Ah, I see!" and with a strong, gentle hand, Bob made the pillow right. "Now, you'll do, eh?"

"Wait a bit," said Robert—"that is, if you've time."

"Oh, yes, I can stop for a jaw, right enough." Bob was never in a hurry.

"I've forgotten such a lot," Robert began, in a shaking voice. "I'm only beginning to remember things now—I never said anything about all you did for me."

"Never mind, that's all right," said Bob, looking as uncomfortable and awkward as the average Briton does under thanks.

"But you risked your life that day, putting your coat over me, too—you ought to have the V.C., and I——"

"It all came in the day's work," said Bob. "Don't tire yourself now thinking about it!"

"But there's something else, and I must tell you," cried Robert, almost hysterically. "Do you remember going to that tennis party, and the accident with that brute of a mule?"

"Of course I do." Of course Bob did. In a flash he saw Nettie's face, rosier than ever, just as he had seen it last, after a certain eventful conversation that had taken place between them as they walked home from the tennis party. The warm summer dusk had been full of fragrance from the hedgerows, and they had lagged behind—quite a good way behind—Auntie and Robert.

"And do you remember saying, as we were riding up the hill, that you were afraid of being shot, if you went into the army?"

"Did I say that" quoth Bob, indifferently.

"Yes, and I believed it!" said Robert.

"Well, maybe I was then, but anyway, you know better now," said Bob, simply. "At least, it's like this—you don't get time to think, when you see a lot of poor beggars wanting you!"

"But," said Robert, almost gasping out the words, "I told that! I said you were afraid! afraid of being shot! I said it to Nettie and her aunt."

Bob did give a jump then, and a flush that might have been anger, showed through the African tan on his face. But it was only for a moment; then he turned to look after an imaginary flying-fish—really to hide a smile.

"It must be the mischief to feel yourself so big," he thought, "and that everything you say is so important. But he never can see if you're pulling his leg!" And he said aloud, with unreflecting candour, "It's all right, old man, I don't suppose she believed it!" And he felt in his pocket for Nettie's last letter.

Ancient Boroughs of Ireland

(From Lewis's "Topographical Dictionary of Ireland," 1837.)

AUGHER.

Augher, a market town (formerly a parliamentary borough), in the parish and barony of Clogher, county of Tyrone, and province of Ulster, 2 miles (N.E. by E.) from Clogher, and 75¼ (N.N.W.) from Dublin; containing 726 inhabitants. Of the origin and early history of this place but very little is known. In the reign of Elizabeth, Lord Deputy Mountjoy placed in it a powerful garrison to defend the pass through the valley in which it is situated, that retained possession for some time, constantly harassing the army of the Earl of Tyrone till his final surrender at Mellifont. From this place the queen's army marched when it crossed the mountains to give battle to the earl at Maheralowney, where that chieftain's principal magazine was taken, in June, 1602. At the time of the English settlement of Ulster, by virtue of a decree by James I., in 1611, Sir Thomas Ridgway, Knt., Treasurer at War for Ireland, received in 1613, a grant of 315 acres of land in the barony of Clogher, under an agreement that he should, within four years, settle on a parcel of land called Agher twenty Englishmen or Scots, chiefly artificers and tradesmen, to be incorporated as burgesses and made a body politic within the said four years; and should set apart convenient places for the site of the town, churchyard, market-place, and public school; he was likewise to assign to the burgesses houses and lands and 30 acres of commons. Sir Thomas received also, in 1611, the grant of a market and two fairs to be held here: and in 1613, the town and precincts, with the exception of a fort and bawn called Spur Royal Castle, which had been erected, were created a borough. Besides the 315 acres of land on which he was to found the borough, Sir Thomas received a grant of 2,000 acres called Portclare; and according to Pinnar's report in 1619, it appears that, besides the fort and bawn, he had built 16 houses of stone in the town, which were inhabited by English artificers who were burgesses, and had each two acres of land, and commons for their cattle. In 1630, Sir James Erskine, Knt., then proprietor of the manor, received a grant of two additional fairs. On the breaking out of the war in 1641, a garrison was stationed here by Col. Chichester and Sir Arthur Tyringham, and the castle was gallantly defended against the insurgent forces, who, in an attempt to take it by storm, were repulsed. Sir James Erskine dying without male issue, the extensive manor of Portclare, which in 1665 was confirmed in the family by Chas. II., under its present name of Favour Royal, was divided between his two daughters, who married into the families of Richardson and Moutray, and the respective portions are still in the possession of their descendants, of whom the present proprietor of Augher Castle has assumed the additional surname and arms of Bunbury. The castle was finally dismantled by order of parliament, and continued in a state of dilapidation and neglect till 1832, when it was restored. The town is situated on the river Blackwater, over which is a bridge adjoining it, and in a fertile valley between two ridges of lofty mountains clothed with verdure to the summit, of which the highest, Knockmany, is covered on its south side with thriving plantations. The charter granted in 1613 incorporated the inhabitants under the style of the "Burgomaster, Free Burgesses, and Commonalty of the Borough of Agher," with the privilege of holding a civil court of record with jurisdiction to the extent of five marks, and of returning two members to the Irish parliament, which they continued to exercise till the Union, when the £15,000 compensation money for the abolition of its franchise was awarded to James, Marquess of Abercorn.

THE NAME OF ATHLONE.

(To the Editor "Dublin Penny Journal.")

Tullamore, June 9th, 1902.

With reference to the article on Athlone in your last issue, in which the name of the town is stated to be derived from "Ath-Luain," meaning "the ford of the moon," it may be of interest to consider another derivation of the name. The tale called the Tain Bo Chuailgne relates how Queen Meadhbh, jealous that she had not among her herds a bull to match her husband's famous bull, "Finnbheannach," or "The White Horned," went to war with the men of Ulster to obtain possession of the Donn Chuailgne, or Brown Bull, owned by Dare Mac Fachtna. She carried off the Brown Bull to her own territory, but as soon as the animal found himself in a strange country, he bellowed so loudly that he attracted the attention of Finnbheannach, and there then ensued a terrible conflict between the two rivals. Donn Chuailgne was victorious, and dashed homewards to Ulster, tossing and shaking the body of his enemy as he went. Wherever a portion of the body of Finnbheannach fell the place was named after it, and Athlone, once called Ath-Mor, received its name from the animal's "luan" or loin which fell there. This is the derivation given by O'Curry. In Joyce's "Irish Names of Places," it is stated to be named after Luain-mic-Luighdheach. Perhaps some other reader could throw more light on the matter.

T. O'G.

The bids opened by Gen. Greely, Chief Signal Officer, for wireless telegraphy systems to be used by the United States Government in Alaska, have called forth tenders from six firms. Among the bids come one from Germany for the Slaby-Arco system. The other bidders were the Marconi Company of London; Foote, Pierson, and Co., New York; the American Wireless Telegraph and Telephone Company, of Philadelphia; the De Forest Wireless Telegraph Company, of New York; and Queen and Co., of Philadelphia.

NOTES AND QUERIES.

THE IRISH IN BUENOS AYRES AND THE RIVER PLATE.

In Sir Horace Rumbold's "The Great Silver River, London, 1887," appears the following interesting reference to our countrymen in this part of South America: "One is at once bound to give precedence to the Irish, who, besides being the most numerous, are unquestionably the most successful of all our settlers in the River Plate. In some respects indeed they are more prosperous than any other foreign bodies. There are among them men who, having originally came out with scarcely a shirt to their back, are now the owners of league upon league of well-stocked land, and rank with the largest proprietors in the country. The Irish were the first to take seriously to sheep-farming out here; and they have so successfully developed that branch of rural industry, that it is claimed that their flocks produce one half of the wool which is exported from this province. Yet barely forty years ago the sheep was looked upon as relatively worthless, and to Irishmen is mainly due the credit of having reclaimed that valuable animal from the contempt and degradation into which it had fallen. There is little doubt that the Irish owe their fortunate beginnings in a great measure to the good influence and judicious direction of their clergy. Submissive as they always have been to the voice of their pastors, they were positively blessed in some of the priests who just came out with them. One of them, Father Fahy, seems to have wielded much the same kind of authority over them one reads of in the story of the missionaries who accompanied the first French settlers in Canada, or of the Jesuit Fathers, who, much about the same time, began to work such wonders among the Guaranis of Paraguay and the adjacent regions. Father Fahy appears not only to have been the trusted adviser of many of his countrymen, but to have constantly acted as their banker and agent, and, owing to his shrewd counsel, their investments became from the outset so profitable that prosperity seems never to have deserted them since. They own almost entire districts in the north and centre of the province of Buenos Ayres, where they have endowed chaplaincies, and founded schools of their own with libraries attached to them.—Evoc.

IRISH AND CARTHAGINIAN.

When Professor Kuno Meyer, in one of his recent lectures in Dublin, spoke of a philologist working to discover in the Irish language traces of African dialects," he had hardly in view the following lines taken from the "Rambles of Latoinayne, a French Emigre in Ireland," Cork, page 132. "General Vallancey has explained the speech of the Carthaginian general in Plantus, and thus proved that these Republicans spoke a language very similar to the Irish. The colony which they call Shiloes at Tunis are supposed to be descended from the Carthaginians, who escaped after the destruction of their empire, and fled to the mountains, distant from the sea coast. Some years ago a Tunis merchant, who knew the language of the Shiloes, came to Dublin about some commercial matters; the deceased Mr Burton Conyngham (uncle of Earl Conyngham), who wished to be sure of the analogy between both languages, invited General Vallancey to breakfast, and introduced him to the Tunisian, without previously informing him he was to be there; to his great surprise they soon entered into conversation with each other, and seemed to be at no loss to comprehend what was said. This merchant had an old woman with him, who was a Shiloe. She conversed without the least difficulty with the Irish, and made herself understood, though her accent and expressions were different.—S. N.

A VIOLET.

(From the German.)

God does not send us strange flowers every year.
When the spring winds blow o'er the pleasant places
The same dear things lift up the same fair faces—
The violet is here.

It all comes back—the odor, grace, and hue—
Each sweet relation of its life repeated;
No blank is left, no looking for is cheated;
It is the thing we knew.

So after the death-winter it must be;
God will not put strange signs in heavenly places;
The old love shall look out from the old faces—
Veilchen! I shall have thee!

RICHARD MONTGOMERY

THE CAREER OF A BRILLIANT IRISH SOLDIER.

By EBLANA.

Richard Montgomery was born in Raphoe, county Donegal, on the 2nd of December, 1736. His father, Thomas Montgomery, sat in College Green as member of the Irish Parliament for Lifford, a constituency of his native county; while Richard's brother, called Black Montgomery, afterwards represented that county.

Richard was educated at Trinity College, Dublin, and at the age of eighteen entered the British army as an ensign in the 17th Infantry, which regiment, three years later, was ordered to Nova Scotia in order to assist in reducing the colonists to submission, and acquiring new territory for the English Government.

His conduct at the siege of Louisburg won the approval of Wolfe, who, with Jeffry Amherst, was about to join the fleet under Boscawen, and in which Howe and Isaac Barre also signalised themselves. This fleet consisted of 22 ships of the line and 15 frigates; the army was 10,000 strong.

The Canadians were cut off from regular intercourse with France, to which country they were united; the policy of the elder Pitt, the British Minister, being to starve them into surrender. So great was the misery that Montcalm, the French commander said: "I shudder when I think of provisions. The famine is very great. For all our success, New France needs peace, or sooner or later it must fall; such are the numbers of the English, such the difficulty of our receiving supplies."

And now after successive failures of the British to capture Canada, the experiment was repeated. For six days a high wind in Chapeau Rouge Bay delayed the arrival of the English forces, and gave the French time to strengthen their lines. But James Wolfe and Richard Montgomery braved the stormy sea, which broke several boats and upset others, and under the fire from the French garrison succeeded at the head of their men in forcing the rampart on landing, taking the batteries, driving the garrison before them, and finally investing Louisburg.

"At that landing," says Bancroft, the historian, "none was more gallant than Richard Montgomery, just one and twenty, Irish by birth, an humble officer in Wolfe's brigade, but also a servant of humanity, enlisted in its corps of immortals. The sagacity of his commander honoured him with well-deserved praise and promotion to a Lieutenancy."

It was on the same occasion that that other Irishman, Isaac Barre, also secured the approbation of Amherst and Wolfe.

Louisburg being reduced to a heap of ruins, the Chevalier de Drucour capitulated, and the garrison became prisoners of war, and were sent to England, where great rejoicings prevailed at the news of the victory. And thus was transferred from France to England the possession of Louisburg, with Cape Breton and Prince Edward's Island.

When Amherst landed with an army in Boston in September, Lieutenant Montgomery was in command of one of the regiments.

Early in the following year the conquest of Canada or New France was determined on by England and America, and the defenders of it had little hope of being able to retain possession. Of its population of 82,000, only 7,000 could serve in the army, the Frenc battalions being only 3,200, while the Englis were nearly 50,000 armed men. The continu attempts of the English to seize upon it re dered the country incapable of yielding to i population its natural resources, and it w cut off from French succour or aid.

The English were successful on Lake O tario, and later on the French abandon Ticonderoga and Crown Point.

But Amherst failed to rout Montcalm fro Quebec until after a severe struggle, whi Montcalm did not live through, and the su render was made by his successor, De Ra say.

In connection with these events the Fren Minister said these prophetic words:

"The cession of Canada will lead to the i dependence of North America."

Richard Montgomery took part in t expedition against Lake Champlain, and l came Adjutant of his regiment in 1760, marc ing on Montreal under Haviland, and becam Captain in 1762. He also fought at M tinique and Havanna, in the West Indies, a then returned to New York.

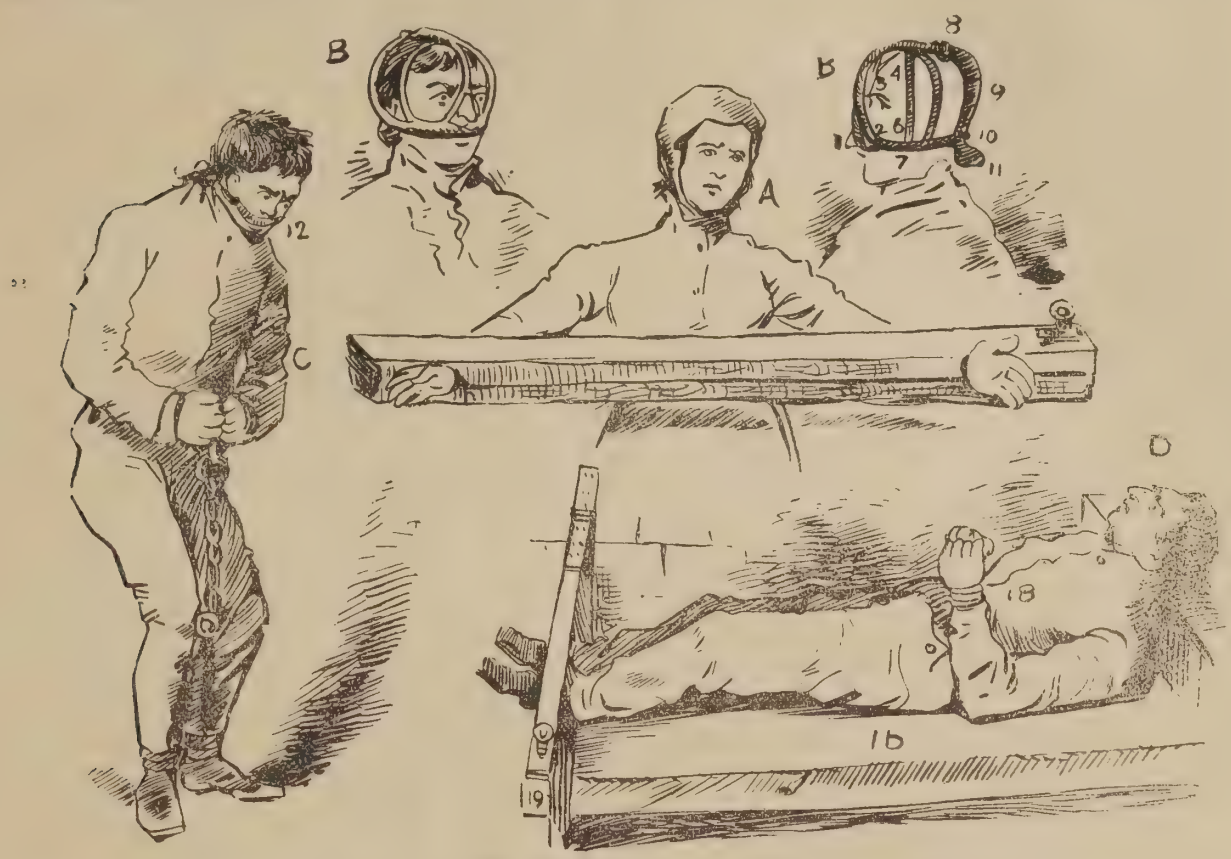
He, in 1763, returned home to Irela spent much of his time in England, and b came intimate with several prominent me bers of Parliament, including Isaac Bar who had also returned, Edmund Burke, a Charles James Fox. But failing to impr the English Government sufficiently with claims for promotion, he resigned his co mission, and returned to America in 17 purchased a farm at King's Bridge, now thickly populated part of New York, and s after renewed his acquaintance with, and m ried the daughter of Judge Robert Livi ston, and thence for the most part lived his wife's residence of Grassmere, n Rhinebeck. They also purchased a handso estate on the banks of the Hudson, a another at Barrytown, and commenced erection of a beautiful house, where he ho they should spend together the remainder their lives in quiet seclusion.

But it was not to be.

Though a sanguine temperament, his ex rience of life, and the manner in which he been over-reached by the English Governm in his just claim for promotion to a major and many other minor trials, had tinged spirit with sadness, and he was wont to s "My happiness is not lasting; but yet, let enjoy it as long as we may, and leave rest to God."

"And," as Bancroft says, "they did en life; blest with parents, brothers, sisters, friends, their circle was always enlivened intelligent conversation and the undistur flow of affection."

In May, 1775, he was sent as a delegate the First Provincial Congress in New Y and in the following June was made Brigad General of the American Army, second place, and the only one not native of N England.



He was then selected to serve with Gen Schuyler against Canada in order to rec it for the now revolutionary colonists, had already made much progress towards i pendence.

But Schuyler, becoming suddenly ill, entire command devolved upon Montgom

IRISH PRISON DISCIPLINE IN 1827.

STRANGE PHYSICAL RESTRAINTS IMPOSED ON REFRACTORY CRIMINALS.

An official enquiry held in Dublin in 1827 at the request of the Most Rev. Dr. Murray and the Council of the Catholic Association revealed the fact that the instruments of torture shown below were in constant use in the Richmond Prison for the purpose of punishing or controlling prisoners. Our engraving is a reproduction of one contained in the official report of the proceedings at the inquiry.

of whom it was said that "though perhaps inferior to Charles Lee in quickness of mind, was much superior both to him and Gates in all the great qualities which adorn the soldier."

In the brilliant campaign against St. John's fortress, which he speedily reduced notwithstanding the sufferings, wants, and mutiny of his soldiers, he likewise captured the first colours taken in the Revolutionary War, those of the 7th Fusiliers, and followed up this success by the taking of Chambley and Montreal.

Ordered to Canada by Washington, he was accompanied as far as Saratoga by his beloved wife, whom he reassured by his good humour and cheerful disposition, his last words to her being:

"You will never have cause to blush for your Montgomery."

On the 12th of November Montgomery took possession of Montreal, requested the Canadians to choose "faithful representatives to sit on the Continental Congress, and make a part of that union."

He declared that "the thirteen colonies could never be securely enjoyed so long as arbitrary government should remain established in Canada, and that no reconciliation could take place till the liberties of all should be secured on the same basis." He said he thought this plan had "the merit of being liberal, and of coming from an honest heart, void of any ambition but that of serving the public."

But amidst all this glory and success he longed to be at Catskills with his beloved wife on his farm and amidst his books.

"I am weary of power," he said to Schuyler; "I must go home this winter if I walk by the side of the lake."

About the same time he wrote to his brother-in-law:

"I have courted fortune and found her kind; I have one more favour to solicit, and then I have done."

At this time he was described as "tall, of fine military presence, of graceful address, with a bright, magnetic face, winning manners, and the bearing of a prince."

And here he parted with his wife, having lived with her only two brief years of happiness, and from which and other places during the winter campaign, he often corresponded with her. In one of the letters he wrote:

"I long to see you in your new home"—that is the mansion he had commenced at Barrytown, and called "Montgomery Place," which was finished in the following spring, and which he was destined never to see.

But he was not without presentiment of his fate, for on first receiving his appointment he, with reluctance, bid adieu to his quiet scheme of life, perhaps for ever; but the will of an oppressed people, compelled to choose between liberty and slavery, must be obeyed.

And now when Mrs. Montgomery was parted from "her soldier," as she was wont lovingly to call him, that hero himself was soon summoned to take command of the expedition against Quebec. He even wrote to Congress:

"'Till Quebec is taken Canada is unconquered."

His small army of less than 300 men was joined by that of Benedict Arnold with 600 men early in December, 1775, when for past services Montgomery was made Major-General. Winter was coming on, smallpox was raging, and the term of enlistment was nearly expiring. He called a council of war, and decided to take the city by assault. He must act now or give up all hope of crowning his career by this engagement; and ordering his troops to assemble at 2 o'clock in the morning of the 31st of December, he pre-

pared for emergencies by having placed on the cap of each man the words "Liberty or Death" on white paper, so that they should be able to recognise each other.

The English General, Gage, wrote home, that "if the King would insist on reducing New England, a very respectable force should take the field"; and the commission to Carleton, as Governor of the Province of Quebec, under the Act of Parliament, conveyed full authority to levy, arm, and employ, not the Canadians only, but "all persons whatsoever," including the Indian tribes from the coast of Labrador to the Ohio, and to march them against the rebels "into any one of the plantations of America."

The President of Columbia College, too, an Englishman published to the world that, in case submission to Parliament should be withheld, civil war would follow, and the Indians would be let loose upon the back settlements to scalp the inhabitants along the border. These Indians were cannibals, and savage and unscrupulous to a degree. But Edmund Burke and Lord Chatham protested loudly against their employment.

Carleton urgently appealed to the Catholic Bishop, who was a stipendiary of the English King, for aid against the Americans, and that prelate caused a pastoral to be read in all the churches in support of the English connection.

But the Canadians refused to fight as directed, all their sympathies being with the Revolutionists. The Bishop's action was due to the passing of the Quebec Act of the previous year which, "besides including in the province all the extent of country from the Ohio to the Mississippi, and all the adjoining territories, also gave a full measure of religious liberty and toleration."

All being now ready for the attack, Montgomery's plan was to alarm the garrison at once; Colonel Livingston, with less than 200 Canadians, was to appear before St. John's Gate on the south-west; a company of Americans, under Browne, at Cape Diamond, where at the proper time they were to fire rockets as the signal for beginning the real attack on the lower town under Arnold, from the west and north, under Montgomery from the south and east.

In a fierce and heavy snowstorm, Montgomery led his men from Wolfe's Cove up slant rocks covered with two feet of snow, and then down a sliding incline of 15 or 20 feet against the cutting wind and hail. The difficulties in his way, of which he wrote, were not without effect on the occasion:

"The New Englanders are the worst stuff imaginable for soldiers. They are home-sick. Their regiments are melted away, and yet not a man dead of any distemper. There is such an equality among them that their officers have no authority, and there are very few among them in whose spirit I have confidence. The privates are all generals but not soldiers, and so jealous that it is impossible, though a man risk his person, to escape the imputation of treachery."

But surmounting these obstacles as best he could, he prepared for the assault.

Montgomery and Cheeseman were the first to enter the barrier between the rock and the pickets; but sending a messenger back to hurry up the troops, our hero observed his surroundings, and found the path extremely narrow, the overhanging cliff on one side, the river on the other, and at the end a fortified blockhouse defended in front by a stockade. It was held by 30 Canadians and 8 British militiamen under Coffin, and 9 seamen under Barnsfare as cannoniers.

Montgomery waited until 60 men joined him, when they carried the first barrier, he exclaiming:

"Men of New York, you will not fear to follow where your general leads; push on, brave boys, Quebec is ours!"

But, alas! as he pushed forward about 50 yards from the mouths of the cannon, which were loaded with grapeshot, and now discharged, Montgomery and his two aides, MacPherson and Cheeseman, with ten others, fell dead. It was the first and only discharge, and his soldiers, discouraged by his death, retreated under Campbell, leaving Carlton at liberty to concentrate his attention on the forces under Arnold, who led the forlorn hope, consisting of twice as many men as the fallen commander had led, soon captured 400 Americans, and drove the remainder from the city.

He was assisted most gallantly by William Maxwell, of New Jersey, and other Irishmen, but the number of New Englanders in his army is avowedly responsible for his failure.

Washington writes:

"The account given of the behaviour of the men under General Montgomery is exactly consonant to the opinion I have formed of these people. . . . Place them behind a parapet, a breastwork, stone wall, or anything that will afford them shelter, they will give a good account of the enemy; but I am as well convinced, as if I had seen it, that they will not march boldly up to a rock, nor stand exposed in a plain."

Washington ascribed the failure and death of Montgomery to the system of short enlistments; he adds:

"For had he not been apprehensive of the troops leaving him at so important a crisis, but continued the blockade of Quebec, a capitulation, from the best accounts I have been able to collect, must inevitably have followed."

Montgomery was discovered pierced by three wounds where he fell, high over the rocks of Cape Diamond, and where has been placed the inscription:

"Here Major-General Montgomery fell, December 31st, 1775."

Quick as lightning passed the words from lips to lips: "Montgomery is dead!"

The French-Canadians, not understanding English, were at a loss to know what the last two words meant. But they recognised the name, "Montgomery," and gathered from the tones of grief and awe of some, and the joyful triumph of others, the import of the dire intelligence.

The Canadians, who were in sympathy with the Revolution, deeply lamented his untimely death, while the loyalists, on the other hand, even to the very nuns in their cloisters, made no secret of their satisfaction, so well had the Quebec Act worked.

And here may be mentioned a disgraceful episode, lately brought to light by one of the nuns of St. Vallere, in a history of her convent, a building which overlooks this historic place, and of which her predecessors of the time had been the witnesses. It appears that Montgomery's body was laid in a shed, or small wooden house, where it was first discovered by his enemies, and to the eternal disgrace of the English name, they severed the head from the body, and placing the former on a pike, carried it through the district with as much ignominy as they could, amidst the jeers and the intense joy of their party, and to the sorrow and indignation of the brave man's friends and fellow-revolutionists.

Bancroft says of Richard Montgomery:

"At his death he was in the first month of his 40th year. He was tall and slender, well-limbed, of a graceful address, and of a strong and active frame. He could endure fatigue and all changes and severities of climate. His judgment was cool, though he kindled in action, imparting confidence and sympathetic courage. Never himself negligent of duty, never avoiding danger, discriminating and energetic, he had the power of conducting freemen by their voluntary love and esteem. An experienced soldier, he was also well versed in letters, particularly in natural sciences. In private life he was a good husband, brother and son, an amiable and faithful friend. The rectitude of his heart shone forth in his actions, which were habitually and unaffectedly directed by a nice moral sense. He overcame difficulties which others shunned to encounter. Foes and friends paid tribute to his worth. The Governor, Lieutenant-Governor, and Council of Quebec, and all the principal officers of the garrison, buried him and his aide-de-camp with the honours of war."

At the news of his death the whole city of Philadelphia was in tears; every person seemed to have lost his nearest relative or heart-friend. Congress proclaimed for him their grateful remembrance, profound respect, and high veneration; and desiring to transmit to future ages a truly worthy example of patriotism, conduct, boldness of enterprise, insuperable perseverance, and contempt of danger and death, they reared a marble monument to the glory of Major-General Richard Montgomery.

The lovers of liberty in the British Parliament also paid tribute to his memory. His fellow-countryman, Isaac Barre, who had been his comrade in the war, wept as he recalled their friendship, and pointed out his superior merits; while another fellow-countryman, Edmund Burke, contrasted the condition of the 8,000 men, starved, disgraced, and shut up within the single town of Boston, with the movements of the hero, who in one campaign had conquered two-thirds of Canada."

To which Lord North responded:

"I cannot join in lamenting the death of Montgomery as a public loss. He was brave, he was able, he was humane, he was generous; but still he was only a brave, able, humane, and generous rebel. Curse on his virtues! they've undone his country!"

"The term 'rebel'" retorted Charles James Fox, "is no certain mark of disgrace. All the great assertors of liberty, the saviours of their country, the benefactors of mankind in all ages have been called 'rebels.' We owe the Constitution, which enables us to sit in this House, to a rebellion."

In 1788 Mrs. Montgomery visited Ireland with letters of introduction from Washington. She met with a reception which indicated the esteem in which her husband's name and memory were held, and the strength of Irish attachment to the principles of American liberty for which he had died.

In 1818, by an "Act of Honour," says Armstrong, passed by the New York Legislature in behalf of Mrs. Montgomery, Sir John Sherbrooke, Governor-General of Canada, was requested to allow her husband's remains to be disinterred and conveyed to New York, which, being granted, De Witt Clinton, Governor of the State, appointed her nephew, Lewis Livingston, to take charge of the body. As the funeral cortege moved down the Hudson, nearing the home he had left in the prime of life, 43 years previously, to fight for his adopted country, Mrs. Montgomery took her place on the broad veranda of the mansion, and requested that she might be left alone as the body passed by. She was found unconscious stretched upon the floor, where she had fallen, overcome with emotion.

She died ten years later, and fifty-three years after his death.

In commemoration of his engagement at Lake Champlain, Fort Montgomery, which commands that lake, was named after him, besides other places.

Congress voted money for a monument to his memory, which was ordered in France by Benjamin Franklin, and erected in St Paul's Church, New York; while the small wooden house, in which his remains had been laid on his fall, is still shown in Quebec.

Thomas D'Arcy M'Ghee has written:—

Comrades, awhile suspend your glee,
And fill your glasses solemnly,
Here's Wolfe, Montcalm, Montgomery!
May honour most one hero's name,
Who looks on Abram's storied plain;
But we conjure to-night the three—
I give the brave man's memory

KITE AND AIRSHIP.

(From the "Dublin Penny Journal," 1832.)

The kite is the prototype from which the flying machine will be developed. The modern idea is but the evolution of this toy, substituting a motor and propeller for the strings. The problem is threefold.

First—To get a surface strong enough to support, say, one pound per square foot.

Second—To get a surface which is stable.

Third—To get a surface which will offer so little resistance to forward motion that but little power is needed to drive it.

The first problem seems to be satisfactorily answered by the Blue Hill box kite construction. This kite, built in the form of a truss, is capable of standing a pressure of five pounds per square foot, and hardly any flying machine would be required to stand such a pressure. Kites are held to the ground, and thus feel a pressure equal to that of the actual velocity of the wind, but when a flying machine leaves the ground and loses its first inertia, there exists for it but one wind, and that is the wind of its own making. To illustrate: The resistance to the movement of a steamer is dependent upon its speed relative to the water in which it floats, and is independent of whether it floats in a strong current or calm water. To fly in wind which is moving over the earth at the rate of 100 miles an hour involves no more pressure on the machine than if it was calm, and therefore the supporting surfaces need only be made strong enough to stand the pressure necessary to support the weight at the given ration of surface to weight, which in this case is one pound to one square foot. Since then these kites above spoken of can stand a pressure of five pounds per square foot, I claim their factor of safety is sufficiently large to prevent their collapse under any air strain to which a flying machine would be subject.

The question now is, what is the future for flying machines?

There is no question in my mind that, like like the balloon, they will never compete with modern method of transporting passengers or freight. In comparison with a navigable balloon they will be very cheap both to build and to run, and very compact, and therefore will be used for individual transportation, perhaps, as the automobile is. They will, I think, perform over long distances, and to otherwise inaccessible points, the same work that the motor bicycle will do on the roads. The stability of a flying machine will be so delicate that, like the bicycle, it will always depend, more or less, upon the skill of its rider to keep it upright, which eliminates it as a passenger-carrying machine, and also limits its size. Nevertheless its importance to the human race will be tremendous.

The art of making malleable glass, which is said to have been well understood by the Egyptians, but which has been for centuries lost, has been rediscovered by Louis Kauffeld, of Richmond, Ind., so the daily Press says. Mr. Kauffeld is a lamp chimney maker, and has for years tried to devise a chimney that would withstand excessive heat. The new process, it is stated, renders possible the making of cooking vessels out of glass.

IRISH SUPERSTITIONS.

By M. J. B.

The great antiquary and historian—O'Donovan—has remarked—"Nothing is clearer than that Patrick engrafted Christianity on the Pagan superstitions with such skill that he won the people over to the Christian religion before they understood the exact difference between the two systems of belief, and much of this half-Pagan, half-Christian religion will be found, not only in the Irish stories of the Middle Ages, but in the superstitions of the peasantry of the present day."—Annals, Four Masters, 131n.

The following extract from a newspaper recalls the old Pagan festival of Belltaine, as well as the belief in the fairies:—

MODERN WITCHCRAFT AT BALLYPOREEN.

PRACTITIONER SENTENCED TO THREE MONTHS' IMPRISONMENT.

An instance of the superstitious associations and belief in witchcraft which still linger in some parts of Ireland was afforded at Clogheen Petty Sessions on Friday, 2nd May, 1902, when a cattle drover named William Murphy, from near Cahir, was brought forward in custody on the charge of having unlawfully entered the lands and premises of John Russel, of Coolapoorawn, Ballyporeen, for the purpose of performing an act of witchcraft on the latter's cattle.

According to old traditions, May morning was the one morning in the year on which sorceries of that kind could be successfully practised, and the "Black Art" flourishes to a considerable extent at the southern side of the Galtees down to the present day. Most of those who believe in the charms generally remain up the night previous to protect their cattle and property from what they fancy to be these baleful influences. So it was with Russell, who remained in the cowshed watching his cattle till three o'clock in the morning. Just before sunset he heard a soft step outside, and immediately afterwards he observed through the dim light a man with a flowing beard enter stealthily with a tin vessel in his hand, and proceed to milk one of the cattle, with the obvious purpose of bewitching them. He was just beginning his mysterious ceremonies, when Mr. Russell sprang upon and felled him to the ground. A short struggle ensued, in which Murphy appealed for mercy. Mr. Russel pinioned him and brought him to the police barracks at Ballyporeen, where Sergeant Price took him into custody. He was subsequently brought to Clogheen, where a Petty Sessions Court was being held that day.

The evidence having been given,

The prisoner threw himself on the mercy of the court, and pleaded for mercy.

The magistrates, after a short consultation, sentenced him to three months' hard labour. He was conveyed to Clonmel prison in the evening by car by Sergeant Price.

The incident has created considerable sensation. It is said that the prisoner is an old practitioner at the "Black Art," and that he has paid his attentions to numerous farmers in the locality.

Another superstition came under my notice the other day. There is an ailment called "thrush," to which infants particularly are liable, and the general belief round here is that the fasting breath of a posthumous child is a cure for this disease. The posthumous child breathes three times on three consecutive mornings into the mouth of the patient, and in the name of the Trinity. I confess I was rather shocked myself at the association of the Sacred Names in a charm of this kind, but I found devout and religious persons thoroughly satisfied of the genuineness and innocence of the charm. It might well be that St. Patrick, instead of trying to stamp out such superstitions, endeavoured to divert the thought from its action, and give the mind a different current, and so allowed the act, while associating it with the Trinity, which, judging from the Patrician documents now remaining, was the article of faith he laid most stress upon.

In O'Curry's "Lectures on the MSS. Materials for Irish History," he relates the old tale of Conall Dearg Ua Carra making a three days' fast to the Devil, to favour him with a heir (p. 280), and the orthodox herb gatherer, I believe, always picks the weed fasting.

In parts of the county Limerick round Adare there is a curious notion that the last person buried in a churchyard is doomed to draw water to the souls in Purgatory, and when two funerals approach at some turn there is a very unseemly rush, each party being anxious to save their own departed from this drudgery!

Some years ago I was present at a friend's funeral to the Old Abbey at Ballylongford, Co. Kerry. After the coffin was put into the vault an old retainer of the family entered the vault and declined to leave until the screws were taken out of the lid of the coffin. I then learned that it is the custom in Kerry to raise the nails with which lids of coffins are usually fastened down, so as to give the poor corpse liberty!

I have met educated gentlemen, of intelligence and sound sense in ordinary affairs of life, who yet firmly believed in the "evil-eye" and the power of "over-looking." The modern discoveries of hypnotism, etc., are regarded by these gentlemen as simply telling them what they knew before from the peasant's tale.

When practising in Kerry I was professionally consulted by a young man as to what steps he could take to prevent his mother-in-law bewitching his wife and cattle. I had to confess our laws, as at present framed, could give him no redress, but I suggested his forbidding the woman to come near his house, and that he could enforce this injunction. She had, however, meantime "drawn" her daughter to her, and the young man left in disgust and horror at the idea of my suggesting he should go and fetch his wife home. He was afraid of getting bewitched himself.

Mr. Worman, United States Consul, reports from Munich that, according to the newspapers, a Hamburg chemist has discovered a fluid which, when added to ordinary water, produces a liquid that cannot be distinguished from petroleum. It can be used for lighting as well as for heating purposes. When burned in a lamp with an ordinary wick it gives an extraordinary white light of double the strength of a petroleum flame. The fluid is not explosive. Experts are, however, doubtful as to the exceptional efficiency of the new fluid.

THE HISTORY AND ANTIQUITIES OF THE CITY OF DUBLIN.

FROM THE EARLIEST ACCOUNTS:

Compiled from Authentick Memoirs, Offices of Record, Manufcript Collections, and other Unexceptionable Vouchers,

By THE LATE WALTER HARRIS, ESQ.

IX.—(Continued.)

A.D. 1014 (War. Antiq.) About the beginning of this year, or the end of the last, Brian Boro made a league with many of the petty princes of Ireland, and they agreed to unite their forces, and expel Sitric and all the Ostmen of Dublin out of the kingdom as public enemies. On the other hand, Sitric, having received intelligence of this union, was not negligent in providing for his own security. Having, therefore, made peace (as is before observed) with Melmurry Mac-Murrough, king of Leinster, he solicited and obtained aids both from him and from the Danes and Norwegians, who inhabited the isle of Man, and the Hebrides or western islands of Scotland, called by the Irish Inche-Gall. Great preparations being thus made on both sides, they met at length on the 23rd of April this year at Clontarf, near Dublin, where after a lang and obstinate engagement king Brien obtained the victory (as most writers say), though he instantly died of the wounds he received in the action. Others, on the contrary, hold, that though the Danish army began to give ground, yet that on the death of king Brien, they rallied, and defeated the confederate army of the Irish with great slaughter. The authors of this latter opinion add, that the rashness of Brien gave great advantage to the Danes. For his ambition was so great, that he would not wait for the auxiliaries, which were expected to join him in three days under his son, Donat, lest he should seem to sully the glory of his former great achievements, and therefore he was easily persuaded to engage the enemy with such forces as he had then about him, which proved fatal to his country and himself. This circumstance also contributed (Keat., 2d part, p. 94. Dub. edit.) not a little to his overthrow, Melaghlin, king of Meath, who had been king of Ireland, and for his indolence and inactivity obliged to abdicate in favour of Brien, smothered a strong resentment in his mind; and though he marched with the forces of his country to Clontarf, yet on the day of battle he drew off, and was only a spectator of the action at a distance. With Brien fell his son Murrough, and Tirlagh, the son of Murrough, a great number of the nobility of the provinces of Munster and Connaught, and 7,000 (some say 11,000) common soldiers. Many, also, of the Ostmen and provincial troops of Leinster were slain, and among them Dubgall the son of Aulaffe, Bruodar, admiral of the Danish fleet (who slew king Brien), Melmurry, king of Leinster, and many others. Some writers affirm that the bodies of Brien and his son Murrough, of Donat O'Kelly, Doulan O'Hartegan, and Gille Barmedi, were buried by the Irish at Kilmainham, a village about a mile from Dublin, near an ancient stone cross; while others hold that the bodies of Brien and Murrough were conveyed from the field of battle to Swords (six miles from Dublin), and from thence attended to Armagh by the archbishop and clergy in procession, where they were deposited in the cathedral there, to which Brien had been a benefactor. After the battle, Sitric retired to Dublin with the remains of the Ostmen, and Melaghlin was rewarded for his treachery by being a second time advanced to the throne of Ireland.

A.D. 1018 (Keat. part 2 p. 98. Dub. Edit.) The Danes of Dublin were quiet for four years after this bloody battle; but at length they began to recover their spirits, and marched into Meath under the conduct of their king Sitric, who wasted and plundered Kells; from whence they took many prisoners, and slew great numbers, who had taken shelter in the church there. But their good fortune forsook them before the end of the year, when they were defeated (War. Antiq.) by king Melaghlin in a battle fought at Fodvay.

A.D. 1019. Bryen Mac-Melmurry, king of Leinster, fell under the jealousy of the Danes, and Sitric, king of Dublin, put out his eyes (Ibid), which (according to a custom long established among the Irish) rendered him incapable of government; so that he was deposed, and Ugar succeeded him.

A.D. 1022 (War. Antiq.) Ugair Mac-Dunluing, king of Leinster, routed Sitric, king of Dublin, in a battle fought at Delgine, and slew a great number of his forces.

A.D. 1029 (Ibid). Sitric, king of the Ostmen of Dublin, undertook a religious pilgrimage to Rome, and died on his journey. He was succeeded by his son Aulaffe Mac-Sitric, who the year following was taken prisoner by Matthew or Mathgaun O'Riagan, and obliged to pay for his ransom 200 cows, 80 British horses, 3 ounces of gold, and a certain sword called Charles's sword: perhaps the sword of Charles Knute, son to the king of Denmark, who fell valiantly fighting in the plains of Clontarf.

A.D. 1035 (Ibid). Aulaffe Mac-Sitric, king of Dublin, was slain in England on a journey he was making to Rome, and was succeeded by his son Sitric Mac-Aulaffe, who the year following slew Reginald O'Hivar, prince of the Danes of Waterford, in the streets of Dublin.

A.D. 1042 (War. Antiq.) This year, or as some say, in the year 1041, Sitric Mac-Aulaffe, king of the Ostmen of Dublin, died. This Sitric, as it is thought, is the same person whom the black-book of Christ-church calls Sitric the son of Ableb, and who, together with Donat, bishop of Dublin, about the year 1038, founded that church in the heart of the city, of which we shall give an account hereafter.

He was succeeded by his son Aulaffe Mac-Sitric, erroneously called Alphred, king of Divelin, by Caradocus of Lhancarvan. About this time, or a year earlier (Caradocus of Lhancarvan), Conan ap Jago, who had married Ranulpha, Aulaffe's daughter, fled to Ireland, to avoid the cruelties of Griffin ap Lewellin, who had usurped Venedotia or North Wales, which of right was Conan's inheritance. Conan, by the assistance of his father-in-law, raised a considerable body of forces in Dublin, and sailed over with them into Wales to assert his claim. With these he took Griffin prisoner by stratagem. But the Welsh, hearing of it, assembled in great numbers, rescued Griffin, and drove Conan to his ships with considerable slaughter.

A.D. 1050 (1). Conan ap Jago made another attempt this year for the recovery of Venedotia; but with as bad fortune as before. For the greatest part of his fleet was wrecked by tempest, and he himself cast upon the Irish shore; and from thenceforth he continued with his father-in-law, Aulaffe, in Dublin.

A.D. 1066 (2). Godred-Crovan, king of Man, is said to have subdued Dublin this year, and a great part of Leinster, and to have made himself king of the parts he had brought under his power. Lanfrank, archbishop of Canterbury, in an epistle (3) to this Godred, styles him king of Ireland, but in a mistake; and at the same time he gives Tirdolvac (who really was king of Ireland) the same title.

A.D. 1071 (War. Ibid). Murrough Mac-Dermod, king of Leinster, died, and was buried by the Ostmen in Dublin, to whom they were tributary. He is called king of the Galls of Leinster, as well as of that province, in some of the Irish annals (4).

A.D. 1074 (War. Antiq.) Donat, first bishop of the Ostmen of Dublin, died, and was buried in his own cathedral near the high altar. His successor, Patrick, was also an Easterling.

A.D. 1076 (Ibid). Godred Crovan, king of Dublin, as also of the islands of Man and the Hebrides, died in the island of Ila (Chron. of Man), called by Ptolemy Epidium. Upon his death, the Ostmen of Dublin elected Godfrid Meranagh for their king.

1. Ware Antiq. Carad. of Lhancarv.

2. Chron. of Man, at the end of the new edition of Camden in English.

3. Usher's Sylloge Epist. p. 6. Baron. Anales, tom 11.

4. Annals of the Priory of All Saints in Lough Ree.

A.D. 1088 (War. Ibid). The Ostmen of Dublin marched to Waterford, and took and burned it down to the ground.

A.D. 1089 (Ibid). The Ostmen of Dublin, Waterford, and Wicklow united, and with joint forces marched out, intending to plunder Cork. But they were met by the people of Oneach, and routed with considerable execution.

A.D. 1095 (War Antiq.) Mortogh O'Brien, king of Ireland, advanced to Dublin with an army, and from thence drove out king Godfrid Meranagh, who soon after died of grief or of the plague, which then ravaged all Europe, and to this, Mac-Geoghan imputes his death. We read of no other king of the Ostmen of Dublin for twenty-five years after this period; and therefore probably king Mortogh governed it, with the rest of Ireland, until his death in 1120; to which the MS. annals of Connell Mac-Geoghan give some countenance, which say, "that Mortogh was constituted king of Dublin, and of the Danes of Ireland."

A.D. 1125 (Ibid). Torfin Mac-Torcall (who was advanced to the government of the Ostmen of Dublin in the year 1120) died this year a sudden death in the flower of his youth, and was succeeded by Donald Mac-Gilleholmock.

A.D. 1134 (War. Antiq.) Cornelius, son to Mortogh, king of Meath, was slain in battle by Donald Mac-Gilleholmock and his Ostmen of Dublin. But by a sudden change of fortune Donald was slain in another battle: this same year the Dublinians were put to flight, and the subjects of Meath broke into Fingal, and wasted it with fire and sword. Donald was succeeded by Reginald Mac-Torcall.

A.D. 1142 (Carad. Lhancar. War. ib.) About this time Cadwallader, revolting from his allegiance to his brother Owen Guinoth, prince of North Wales, fled into Ireland, and agreed with the Ostmen of Dublin for two thousand marks to raise a complete army, and make war on his brother. The army was raised, and composed partly of Ostmen and partly of Irish, and sent into Wales under the command of Octer, and the sons of Torcall and Cherulph. But soon after they had landed, hearing that the brothers had made peace, they detained Cadwallader prisoner, until he gave them two thousand head of cattle for the two thousand marks stipulated to be paid them for their wages. These things being so done, Owen Guineth unexpectedly fell on the Ostmen and Irish thus loaded with spoils before they could recover their fleet, slew a great number, and returned with the booty. The remains of this shattered army got on ship-board, and returned home with shame and loss.

A.D. 1147 (War. Antiq.) Reginald Mac-Torcall, king of Dublin, being this year slain in battle by the people of Meath, Godfrid Mac-Olave, king of Man, was (according to the Manks chronicle) recognised king by the Ostmen of Dublin. But (according to the annals of Ireland) (Annals of Abbey-Boyle ad. an. 1148) Oiter or Octer is said to have succeeded Reginald; yet possibly he might have governed in subordination to the king of Man. However that may be, Octer was slain two years after by the sons of Torcall (as the said annals relate), upon which Brodar Mac-Torcall, brother to Reginald, obtained the principality of Dublin.

A.D. 1161 (War. Antiq.) Brodar Mac-Torcall, king of the Ostmen of Dublin, was slain in battle by the inhabitants of Meath, and his brother Asculph Mac-Torcall succeeded him.

A.D. 1162. The Ostmen of Dublin were over-run and spoiled by Dermod Mac-Murrough, king of Leinster, who bore a greater sway over them than any other king had done for a long time.

A.D. 1165. Henry II. king of England, being alarmed by the insurrections of the Welsh, who, under the conduct of David ap Owen, prince of North Wales, had invaded and pillaged part of that king's country, he levied an army through all his dominions of England and France, and had succours from Flanders and Bretagne, resolving to chastise that people. Among these the Ostmen of Dublin, either as auxiliaries or allies, attended king Henry with a good body of forces, and continued half a year in his service. But partly from the difficulties of the passes, and partly through want of provisions, the king was obliged to break up his camp ingloriously, and the Ostmen, half starved for want of bread, returned home.

A.D. 1167 (War. Antiq.) Roderick O'Connor, king of Ireland, invaded Leinster, put Dermod Mac-Murrough, king of that province, to flight, and obliged the Lagenians, and particularly the Ostmen of Dublin, to give him hostages. The cause of this war was not only the cruelty and oppression which king Dermod exercised over his subjects, but a rape committed by him on the wife of Tiernan O'Roirk, king of Breffiny, which in its consequences brought on the invasion of the English; of which so far as relates to Dublin in the next chapter.

(To be Continued.)

Mr. Abraham, in an article on the theory of the propagation of electric waves along wires in Annalen der Physik, distinguishes two cases in the first of which the return current is a pure conduction current, and in the second of which displacement currents also come into action. Ordinary telegraphy and telephony belong to the first category, and space telegraphy to the second. In oscillations of the Hertzian order it depends upon the distance between parellel conductors whether di-electric return currents come into play. The author discusses the relation between the conditions of propagation and the electromagnetic energy of the waves. He proves, among other theorems, that in stationary electromagnetic oscillations in a field bordered partly by perefct reflecting surfaces, while through the remainder plane homogeneous waves import and export energy, the mean magnetic energy equals the mean electrical energy. In the case of wire waves, the effective and apparent internal inductances are identical, and when the return circuit is metallic, and, therefore, the values of the apparent capacity and apparent external inductance are real, these values are identical with the values of the effective capacity and the effective external inductance derived from the field energy.

CORONATION CEREMONIES

Notwithstanding the contempt which the so-called Anglo-Saxon seems to have (through ignorance-invincible, perhaps) for the Celt and for ancient Celtic civilisation, those great moderns may yet wonder if they learn how much they are indebted even for their own records to that ancient civilisation, and how much they unconsciously possess at the present day direct from the hands of those despised ancients. But of this more anon. Coronation ceremonies now hold the field. It is quite unnecessary to say anything of the Lia Fail, now lying under the chair of the Confessor; its history in various versions is well known but it may be worth noting that after Bannockburn, when the Scottish regalia was demanded, the Lia Fail was not given up. The Londoners, we are told, knowing the old prophecy (those supposed Saxons are really more superstitious than the Celts), exclaimed, "We will fight for the stone." This stone was, it would seem, only lent to the Albanian Scottish colony by the Irish monarch, Murttough, or MacEares, the first Christian king of Ireland, in order that his kinsman, Fergus, might be inaugurated or crowned upon it in 503. This aiding of the colony (first established in Argyle—territory of the Gael—and the Isles, at the close of the second century) by the Irish monarch, after it had suffered a severe defeat from the Picts is by Tighernach placed under the date 506, and by the "Four Masters" at 498. Loarn, Arngus, and Fergus were the leaders of the force. Some authorities hold that the Lia Fail was not sent until about 850, when the Picts were finally subdued, and Kenneth Macalpine became the first king of all Scotland. The Irish monarch, Hugh Finnliath, was married to a daughter of Kenneth MacAlpine. It was this monarch who removed the royal residence to Scone, and there, when the stone was removed, the ancient records of Scotland were destroyed, about 1300, by Edward I., in order, it is said, to blot out, if possible, the nationality of the people; hence we have had various fraudulent histories, some even asserting that Alba was the mother country, and all the celebrated men termed Scots were thus claimed for Alba. It seems that this absurdity continued up to the eighteenth century. When King Aidan, of Scotland, was inaugurated, St. Columbkille performed the ceremony, and this is said to be the first mention in European annals of the anointing of kings at coronation. St. Columbkille, who was grandson of Loarn, one of the leaders in 503, left Ireland for Iona in 563, which then belonged to the Picts, and he is regarded as the apostle of both the Picts and Scots of North Britain. The Picts, it must be remembered, were half Scots, for when proceeding to Scotland they received Milesian women as wives, and then made a compact to choose a king from the female line rather than the male, in case of dispute, with the Milesians, as Venerable Bede remarks, and which continued to his own day; but, as we find that St. Columbkille was obliged to use an interpreter, when evangelizing them, one cannot conclude that the Picts were originally of the same immediate race as the Scots. Even during the course of the many centuries that intervened, the language could not, perhaps, have so much changed as to require this. In 573, when St. Columbkille came back to Ireland to attend the convention of Drumceast—the first Feis held after the abandonment of Tara—the independence of the Albanian Scottish colony was established. The saint's death is by some authorities placed under date, 592, and by others, 597. It may be considered somewhat strange to find Andamnan, the successor and biographer of St. Columbkille, obliged to censure the conduct of Donnell Bruce, King of the Albanian Scots, for combining with Picts, Britons, and Saxons, and invading, in 634, the country of his ancestors. Donnell, chief of the Northern Hy-Miall, however, disposed of the invaders at Magh Rath, or Moyra, in Down. An authority says of Andamnan's work, that it is "the most complete piece of such biography that all Europe can boast of, not only at so early a period, but through the whole Middle Ages

LITERARY NOTES.

Lord Roberts's "Rise of Wellington" is about to be issued as a sixpenny by Messrs. Sampson, Low, Marston and Co.

✧ ✧ ✧

There have already been some forty-eight editions of Blackmore's celebrated novel, "Lorna Doone." The publishers, Messrs. Sampson, Low, Marston and Co., have now a second sixpenny edition in hand. Some five years ago it was issued at sixpence, but the edition was exhausted in two or three weeks.

✧ ✧ ✧

The late Mr. E. L. Godkin had for some years past been engaged on a work of personal reminiscences. Mr. Godkin was for many years a regular correspondent with Mr. Gladstone and with several representative men in literature and politics in this country. The volume will, we understand, be ready in the autumn.

✧ ✧ ✧

The biographer of the late Marquis of Dufferin and Ava has not yet been chosen, but Lady Dufferin, to whose charge all the papers and correspondence have been left, will be obliged if any of Lord Dufferin's friends will send her such letters as may be useful for the Life.

✧ ✧ ✧

Mr. John Morley, who is now engaged in reading the final proofs of his "Life of Gladstone," has, it is said, arranged the letters of the great Liberal statesman in different sections of the biography; that is, the correspondence that has been deemed worthy of embodiment in the Life appears under the respective headings of political, ecclesiastical, theological, and literary. Mr. Morley's magnum opus will almost certainly be published in the autumn of this year.

✧ ✧ ✧

Matthew Arnold's first excursion in literature was "Alaric at Rome," a prize poem written in his nineteenth year, and recited at Rugby School on June 12, 1840. It was printed, on eleven pages, by Combe and Crossley, Rugby, in 1840, and until recently one copy only, that in the libary of Mr. Edmund Gosse, was known. A second, in original pink printed paper, bearing the name "H. Davies, 1840," realised £50 the other day, or equivalent to about fifteen times its weight in sovereigns.

✧ ✧ ✧

The signing of peace, the "Academy" remarks, has been received in comparative silence by the established poets. Mr. Francis Thompson contributed an ode to the "Daily Chronicle," and the occasional poets of the daily papers were ready with their rifles; but the Poet Laureate was dumb, and neither Mr. Kipling, Mr. Watson, nor Mr. Phillips lifted up their voices. We, ourselves, were a little surprised not to receive any poetical offerings on the subject, although since last Monday we have been offered three poems on June, and an ode of several pages on September.

✧ ✧ ✧

A country corrspondent tells us, we read in the same journal, that the end of the war was announced to him by a servant in the following quaint terms: "Oh, sir, the bells has been ringing all night, and the war's at peace." Many country dwellers who went to bed reasonably early on Sunday night, were awakened by unexpected bells. One of the quietest villages in Surrey was flooded with chimes at eleven o'clock at night. Indeed, it may be said that peace, in this instance, more than war, "startled the villages with strange alarms."

✧ ✧ ✧

We have pleasure in bringing under the notice of our readers "A History and Genealogy of the Warren Family in Normandy, Great Britain, and Ireland, France, Holland, Tuscany, United States of America," etc. (2 D 912-1902), by the Rev. Thomas Warren, F.R.S.A., of 29 Gipsy Hill, Upper Norwood, London, which has just been issued. This handsome and sumptuous volume is the result of many years' laborious research, and contains many interesting biographical and historical sketches, and will serve as an important Book of Reference on its subject. The edition is limited to 300 copies, which can only be obtained from the author. An early application is desirable, as already a large portion of the issue has been subscribed for. The price of the work is 10s. 6d. net, with 6d. extra for postage.

✧ ✧ ✧

Is the "series" or "library" form of publication played out? The "Publisher's Circular" discusses the question with particular regard to novels, and comes to the conclusion that, with a few exceptions, the series of copyright books in uniform bindings is doing badly. There was a time when things were far otherwise, and a good addition to a good series, or even an indifferent addition, could command a definite advance subscription. But now a novel published on its own account appears, on the whole, to stand a better chance. The fact is, we imagine, says the "Academy," that the "series" was somewhat in the nature of a bait to the public, and when the baits became too plentiful the public declined to be caught.

✧ ✧ ✧

A correspondent of a London contemporary writes:—As you occasionally reproduce some of the amusing cartoons of the Berlin satirical-political paper "Kladderadatsch," it may interest your readers to know what this strange word "Kladderadatsch" means, or signifies, and how it originated. "Kladderadatsch" is a refined slang word, coined by the past generation of old Berliners for expressing a surprising, dashing, untoward, sudden event; it was as such, if I am correctly informed, little known or used until about fifty years ago. When, in 1848, after the revolutions which convulsed the whole continent of Europe, a group of literary and political gentlemen in Berlin had decided to publish a new independent political-satirical paper, after the style of "Punch," they failed to agree upon a suitable name for such publication.

✧ ✧ ✧

Although Mr. Godkin despised what he called the tricks of journalism, he employed one honourable device, old as the "Delenda est Carthago" of the Roman orator. He placed a high value on reiteration. Discuss a matter once and your reader will forget it, was his reasoning; keep on asserting it, and you will make converts. "With this in view, he not only kept on discussing a favourite topic, but he frequently gave an order regarding some citation from a speech, editorial, or the like. 'Let this appear every day during the campaign.' Nor was this rule confined to subjects political, as his readers will remember who recall his persistent attacks on the 'brutality' of football and on the spitting abuse." Mr. Godkin was not specially industrious, though he was tenacious; he disliked research. He was not always quite fair to opponents, but this was only because he attacked ideas with implacable vigour and incidentally hurt their upholders. He influenced millions, and went unrecognised in the street.

✧ ✧ ✧

From time to time we hear of some melancholy connection between great literature and petty larceny. Such a case is brought to the public notice by Mrs. Lewis in the "Expository Times." Leaf 101 of the Lewis Syriac palimpsest has disappeared from the library of the Monastery of Mount Sinai. Mrs. Lewis gives a facsimile of it, and says that she missed it at Mount Sinai last February, but the monks had already discovered their loss:—

I was informed that a party of several scholars had worked for some time at that Ms. during the course of last summer; and it is safe to suppose that a fair number of passing travellers had been permitted not only to look at it, but also to handle it. My surmise is that one of these latter, wishing to make an addition to his own collection of curios, had slipped the leaf between the pages of a book, in the fond belief that it would never be missed. . . . The man who knowingly injures a fourteenth-century codex of the gospels commits an act of sacrilege.

Mrs. Lewis wishes the purloiner to return the lost leaf to her, in which case it will be replaced in the codex and no questions will be asked.

✧ ✧ ✧

The Paris correspondent of the "Daily News" remarks that a volume of poems, now in press, by M. Frederick Humbert, suggests the idea that he may be ranked among the victims of his wife. The author showed about a fortnight ago anxiety that his work should appear on the 15th. He promised each of the compositors a hundred francs if they got it through on that date. The first set of proofs passed through his hands, but the second lie uncorrected at the publishers'. One of them headed "Papier brule," or reflections on a burned paper, might have been written in a prophetic spirit. The paper has lost in the flame weight, whiteness, printed words—all that gave it value—and now rises towards the blue sky. If likewise the author should lose all that he has in the world, perhaps he might find compensation. Misfortune purges us of dross and renders us more fit to live according to our ideal. The meditations on the small satisfaction wealth gives are worth reading as a confession:—

Dans un hotel splendide ou l'art et la richesse
Ont melé le bien-étre et le plaisir des yeux
Il est navrant de voir, inutile largesse,
Les festins prodigués au maitre de ces lieux

Usé par des excés et l'agè, il est livide
Et ne sauriat gouter ni les mets ni le vin;
Patés, chapons dorés, c'est sa livrée avide
Qui les mange, car lui ne connait plus la faim.

Pendant ce temps, tapis sous sa porte cochère,
Grelotte un pauvre enfant en guenilles, a jeun,
Dont l'appétit de loup ferait friande chere
Du moindre de ces mets gaspillés un par un.

✧ ✧ ✧

Mr. Godkin was a splendid type of the powerful, but comparatively unknown, journalist, and is so portrayed by Mr. William A. Linn in the New York "Times Saturday Review." Mr. Linn served under Mr. Godkin for many years as managing editor on the New York "Evening Post," and some of the glimpses he gives us of this powerful moulder of opinion are very interesting. Mr. Godkin cared nothing about news, and he even stigmatised as "journalism" all sensations, violations of private life, and unworthy devices to make a paper sell His province was the editorial page, and here he was great—all the greater, too, because his strength flowered continually into humour. Mr. Linn writes:—

The humorous aspect of every question (if it had one) always seemed to present itself to him first. And how he delighted to hold it up and picture it and enjoy it. Many a morning during the brief council with his assistants of the editorial page which laid out the subjects for the day's discussion, he would work himself up into what may literally be called a glee over some matter that was suggested, telling an amusing anecdote that was pertinent (his stories, if few, were always of the best), and then perhaps condensing the whole discussion into one of those sparkling editorial paragraphs which no other man ever wrote so well. Possibly nothing that was ever published about him by his sneering critics afforded him so much amusement as the story that, when his editorial council met for its daily consultation, he compelled the members to begin their work by singing "God Save the Queen." He recognised in this the concentration of the "un-Americanism" which such critics attributed to him, and he enjoyed the satire as well as if it were one of his own construction. A favourite anecdote was concerning one of his acquaintances who called on him soon after the "Nation" was started, and said "I want to write for your paper. I know I can write well. The only trouble is I don't know what to write about." That contained, in his view the pith of journalistic incompetence.

SCIENTIFIC TOPICS.

The new Edison storage battery is now on the market commercially. It has been officially announced that the plant for its manufacture at Silver Lake, N. J., has been completed, and that the company is ready to take orders.

✧ ✧ ✧

In the museum at the University of Arizona at Tucson, a skeleton of a very large whale found in the desert south of Yuma has been mounted. Other finds of rare value have been made in this same region. In the University Museum are the tusks and lower jaw of an elephant found in the Yuma desert.

✧ ✧ ✧

At the meeting of the American Institute of Electrical Engineers to be held at Great Barrington from June 18 to 21, it is said that Marconi will for the first time make inland long-distance wireless telegraphic tests. The tests will be made on the second day of the convention. Besides Marconi, Tesla and Edison are expected to be guests of the Institute.

✧ ✧ ✧

An adequate idea of the high value of a modern Atlantic liner may be gathered from the fact that the insurance value of the North German Lloyd steamship Kaiser Wilhelm II., now in course of construction at the Vulcan Shipyard, Stettin, is £318,250. This represents only the launching value of the bare hull. A further insurance sum of £709,896 is required to cover the ship for the first trial trip, while the company require a total sum underwritten on completion of the vessel of £1,295,000. The risk of launching, river work, and trials is to be covered by the policies.

✧ ✧ ✧

A Russian inventor, Nicolas Gherassimoff, of St. Petersburg, has devised an apparatus which is intended to prevent collisions at sea. The apparatus is operated by the use of contact devices which he calls "feelers." The feelers move in advance of the ship and at such a depth as not to be materially interfered with by the waves. They are so disposed and connected as to indicate an obstruction, stationary or floating, beneath the surface, whether in the direct course of the ship or on one or the other side. The diversion of the feelers from a straight course, due to their collision with an obstruction in their path, or to the action of such obstruction on their connecting devices, is made use of to indicate the course that the vessel is to take in order to avoid the obstruction.

✧ ✧ ✧

About 3,100 miles of narrow-gauge railroad are to be built in Spain at a cost of £10,000,000 The scheme is one of the greatest that Spanish statesmen have devised to secure better transportation facilities. Spain's inadequate railway facilities are due not so much to the indolence of her people as to the topographical formation of the country. The mountains offer an obstacle to railway building; and the rivers are too small and swift for many steamers. Freight and passenger rates are high. About 1¾d per mile is charged for 400 miles. The speed of passenger express trains never exceeds 27 miles per hour. Ordinary trains never make more than 15 to 20 miles an hour. So costly is freight transportation that it is cheaper to carry goods from England to Spain than it is to ship them from Saragossa to Barcelona.

✧ ✧ ✧

A Perth Amboy inventor has patented a device "whereby those who desire it may experience the novel sensation of diving in a water-tight submarine boat, making a trip under water, and coming to the surface again at the landing place." Means by which the "novel sensation" is obtained are a waterway deep enough to submerge the boat, a track in the waterway, a boat moving along the track, and mechanism for propelling the boat. The track is endless. The boat describes a circuit, so that the passengers are received and discharged at the same elevated point. This elevated point of the track is connected with the main submerged portion by inclines.

✧ ✧ ✧

A special writer for "Leslie's Weekly" recounts in a recent issue some of the observations he made while travelling over the Trans-Siberian Railroad. He says the road has been engineered so that it runs through the richest part of the territory. The name Siberia stands for all the Asiatic dominions of Russia except Transcaucasia, Transcaspia, and Turkestan. It is at present divided into the following provinces—Western Siberia, including the Governments of Tobolsk and Tomsk, in the basin of the Ob River. Its area is 42,000 square geographical miles. The southern part of these regions, lying immediately east of the Urals, stretches far south toward the Khirgiz Steppe Borderland and the region known as Baraba. Over an area twice as large as Japan, this vast Siberian plain is composed of black earth, and has scarcely a rock or stone. This black earth, or chernoziom, is the real treasure of Siberia, and makes the western plain the granary of Russia. Wheat, rye, oats, and barley are grown in large quantities; crops of many fold were reaped last year. The two things that militate against the crops are the late frosts and the want of snow in winter. But when riding through the wheat fields in June the land seemed as rich and prosperous as Dakota. For hundreds of miles, even up as far north as Tobolsk, at 59 degrees, nothing but grain fields growing green were seen. Winter wheat is seldom sown, but spring wheat is sown from April 10. Frosts in the wheat area generally begin in September. The land is tilled by the fallow-land system.

✧ ✧ ✧

M. E. Mayer made a communication recently to the Wurtemburg section of the German Engineers' Association relating to the consumption of an alcohol motor. A society has been formed in Germany with a view of encouraging the use of alcohol in industrial applications, and this society has engaged itself to furnish, under certain conditions, alcohol at 90 per cent for the average price of 18s. 3½d. per hectolire (26.4 gallons), which makes the price per kilogramme equal to .054 cent. It is found that one kilogramme of alcohol produces 6,000 calories, while a kilogramme of petroleum, costing less than ½d, gives 10,000. According to the calculations, therefore, the use of alcohol seems less favaurable by 80 per cent. In the practical tests with a motor of 14 horse power it was shown that an alcohol motor only consumes 68 per cent of the heat units needed in a petroleum motor to produce the same power. The reason lies in the amount of water contained in the alcohol which gives a less abrupt expansion, and also permits a higher compression, and thus gives a more advantageous utilisation of the heat. According to the latest trials, the cost of the alcohol was but 22 per cent. higher than that of petroleum for a given power. This is partly due to the fact that the society has recently lowered the price of alcohol to 13s per car load of 5,000 kilogrammes (11,000 pounds).

✧ ✧ ✧

The circular railway which passes around Mount Etna is interesting on account of the geological conditions encountered in its construction as well as the nature of the country which it passes through. In many points of the route the surface consists of layers of lava, and more than twenty-two miles of cutting had to be made across the lava, which is hard as granite. In this way the line, which is only 70 miles long, required no less than four years to execute. The road leaves the station of Borgo and mounts first across a region of flourishing vegetation, among vineyards, wheat fields and orange orchards, but soon it enters an arid and treeless portion, and runs between hillocks of lava until it reaches a fertile strip at Belpasso, a district which suffered greatly from the eruption of 1669. The road again passes through the small town of Misterbianco, which was destroyed by the same eruption, and reaches Paterno, with its miniature volcanoes, which throw out salt mud, and its ferruginous springs. Farther on is Aderno, which has a waterfall and a river, two things which are quite rare in Sicily. Then the route passes through Bronte, which has been often threatened with destruction by lava, and was especially in danger in 1832 and 1843. The last station is Giarre-Riposto, from which it is easy to reach Messina or Catania. This road will be very much appreciated by tourists, and will also serve as an outlet for the products of this populous region.

✧ ✧ ✧

For some time past the comparative shallow depth of the water at the various ports of the Sea of Azoff has attracted the serious attention of the Russian Government. First class steamers cannot secure proper accommodation, with the result that cargoes have to be unloaded by lighters, thus incurring great expense and delay. The Straits of Kertch are only about 45 feet in depth; at Taganrog the depth is only 7 feet 6 inches, while Marignopole is inaccessible owing to a great sandbank, which reduces the depth of water to about 5 feet at the maximum. The Russian Government has sought to overcome the difficulty by dredging the various ports, but the results achieved are disappointing. The authorities now propose to construct a barrage across the Straits of Kertch, thus raising the water level of the Sea of Azoff. The width of the straits between the Crimean shore and the Tusla promontory is 10,823 feet, but of this total width only a little over 4,000 feet, giving an average depth of 27 feet, can be utilised. The construction of an embankment 51,480 feet in length is now contemplated, which will provide several large central basins with sufficient depth of water to accommodate large first class steamers. The total cost of the scheme is estimated at 9,800,000 roubles, approximately one-third of hich will be expended as compensation to private individuals. The authorities propose to recoup themselves, however, by the levy of dues upon all ships passing through the straits. The completion of such a scheme will tend materially to increase the shipping traffic with the Azoff ports.

✧ ✧ ✧

To an English machinist, Joseph Jenks, belongs the honour of having secured the first American patent. A blacksmith in Hammersmith, England, in 1643, he was a man of great renown, by reason of his inventive skill in the art of making machines. Emigrating to the colony of Massachusettes in the fall of 1643, about the same time that Rev. John Harvard arrived, he settled in Lynn. This man Jenks cut the dies for the coining of the old colonial "pine tree" money. He also invented the first apparatus for extinguishing fires, a kind of primitive hand-pump on wheels. His application for a patent on a water-power device for mills was granted by the Colonial Court, and is probably the first patent on record in America. The court had jurisdiction over the Massachusetts Bay Colony, embracing nearly all of New England at that time. The limit of the monopoly was fourteen years, and the court retained not only power to forbid exportation, but also power to prevent exorbitant charges made upon the public. The patent was issued in this form: "At a general Courte at Boston the 6th of the 3rd Mo. 1648. The cor't consid-inge ye necessity of raising such manifactures of engins of mills to go by water for speedy dispatch of much worke with few hands, and being sufficiently informed of ye ability of ye petition to performe such workes grant his petition (yet no other person shall set up or use any such new invention, or trade for fourteen years without ye licence of him the said Joseph Jenkes) so farr as concerns any such new invention, and so it shall be always in ye power of this co'te to restrain ye exportation of such manufactures and ye prizes of them to moderation if occasion to require."

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1793.)

THURSDAY, FEBRUARY 8.

His Excellency the Lord Lieutenant has been pleased to appoint the following gentlemen to be High Sheriffs for the present year:—

COUNTY CAVAN.
Thomas Fleming, of Castle Cosby, Esq.

COUNTY KILKENNY.
Richard Alcock, of Kilmurry, Esq.

COUNTY MONAGHAN.
Alexander Kerr, of Newbliss, Esq.

Yesterday the Judges of the Court of King's Bench came to a final determination on a motion which was made to set aside the verdict against Archibald Hamilton Rowan, Esq., which was that the verdict should be allowed. After which the Court delivered the following sentence: That Mr. Rowan should be subjected to a fine of £500 sterling; be confined two years in his Majesty's goal Newgate; and give £4,000 sterling security to keep the peace for the term of seven years; himself to be bound in a recognizance of £2,000, and two sureties in £1,000 each.

Mr. Hamilton Rowan was conveyed back to Newgate in his own carriage, in the custody of Mr. Sheriff Jenkin, and Mr. Gregg, gaoler, without any military escort.

The "Union Snow," from Virginia to Dublin, is lost near Ormshead.

The three last "London Gazettes" contain twenty-eight new commissions of bankruptcy.

The Rev. Dr. Samuel Murray acknowledges to have received from a gentleman (who minutely examined the House of Industry, and the situation of its very numerous poor), the sum of thirty guineas, for the particular purpose of purchasing clothing for the children in the house. An example truly worthy, at this season, of the imitation of the opulent, and tending to promote the sale of our manufactures.

CORK, JANUARY 28.

EXTRACT OF A LETTER FROM A GENTLEMAN IN BORDEAUX TO HIS FATHER IN THIS CITY, DATED DEC. 26, 1793.

"I am once more at liberty, an event which in my last I informed you I expected would shortly take place. On the 24th all the prisoners confined here as subjects of Great Britain were liberated. On Christmas Day I had the honour, with numbers of my countrymen, of dining in company with one of the Commissioners, when he addressd us in a short but pathetic speech, assuring us that it was with the greatest reluctance the National Convention found itself under the necessity of adopting measures so repugnant to their wishes, but that from the vast number of spies sent, and the many under-practices made use of by the English Government, such a measure had become for a time indispensibly necessary. He begged further to assure us, that the Convention still retained the highest opinion of the great body of the people in Great Britain and Ireland, and that he was directed to inform us, the first neutral vessel that arrived in that harbour, should be hired for the purpose of conveying to their native country, all such subjects of Great Britain as should wish to return. Never were prisoners so happy as we were during our confinement—beautiful gardens to walk in, and a free intercourse with each other; we had liberty to write to our friends, together with plenty of the best provisions, good beds, etc, and all at the expense of the nation."

EXTRACT OF A LETTER FROM LIMERICK.

"The learned and benevolent Dr. Maunsell, author of the celebrated theory on the cultivation of potatoes, ever vigilant for some unexplored means of serving his country, has ready for the press, an appeal to the Right Reverend Prelates of Great Britain and Ireland, on the expediency of making a provision for curates out of the revenue of the non-resident incumbents; this plan he suggested on the principle of revoking the resolution of the House of Commons relative to tithes of agistment, and applying their produce to the use of the curates in this kingdom. The outlines of his plan for the relief of that distressed but exemplary body in Great Britain, have not as yet transpired."

The English Government, we hear, has purchased the late Mr. John Hunter's Anatomical preparations, which are to be paid for by a pension to his widow. They are to be sent to the British Museum, where they will soon go to ruin, unless more than ordinary pains be taken to preserve them. A more secure and more noble purchase would be that of the medals of the late Dr. William Hunter, which would thus be retained in the capital: where alone there are men capable of employing them to the best advantage of literature and ancient history.

11.—Mr. Gibbons' valuable library is to be brought to England, and to be sold by auction. It consisted of upwards of nine thousand volumes, which were deposited in a suite of seven large rooms in his house at Lausanne. The books were admirably chosen, being all purchased by himself. They are all elegantly bound, forming at once the most splendid and most useful collection that was ever possessed by any private gentleman. Besides this noble library, he has left thirty thousand pounds in money. We do not find that he had anything of consequence prepared for the press. Indeed he had relinquished the idea of ever publishing more. We cannot but regret, for the sake of mankind, that he had published so much.

THE KING v. M'CREARY AND OTHERS, PRINTERS OF THE "NORTHERN STAR."

A motion was made this day to postpone the trial at bar in this cause, grounded on an affidavit of one of the defendants, stating that Æneas Lamont, the corrector of the press to the "Northern Star," at the time of the publication alledged, who is a material witness for the defendant, could not be found in this kingdom; but that the defendants, understanding that he had gone to Scotland, would be diligent in endeavouring to procure his attendance by next term.

This motion was opposed on the part of the Crown; but the Court was of opinion that the ground laid was sufficient, especially as the prosecution had once already postponed the trial.

Monday, the 19th of May, was appointed for the trial.

Friday Messrs. Bird, Hamill, and Delahoyd, from Drogheda, were, upon motion, admitted to bail in the Court of King's Bench.

Yesterday John M'Dermot was tried at bar, in the Court of King's Bench, by a jury of the county Roscommon. At eleven o'clock at night the jury retired for about twenty minutes, when they returned with a verdict Guilty, but recommended the prisoner as an object of mercy. The charge against him was heading the mob which destroyed and plundered Mr. Tenison's house, Castle Tenison, on the 21st of May last, a crime which is punishable by death. His wretched appearance (for half his face is shot off) interested the feelings of every person present.

LIMERICK, FEBRUARY 13.

At a Common Council convened on Monday last, the freedom of this city was voted to the following Roman Catholic clergy and merchants, viz:— Rev. Dr. Denis Conway, Titular-Bishop of Limerick; Rev .Dr. Peter M'Mahon, Titular-Bishop of Killaloe; Stephen Roche John, Esq.; Michael Roche John, Esq.; and Michael Rochfort, Esq.

DUBLIN, FEBRUARY 13.

Yesterday, in consequence of the order of the preceding day, Mr. Fay, of Navan, was brought into the Court of King's Bench, when Mr. William Smith argued for his admission to bail, and was answered by the Attorney-General. The Chief Justice pronounced the opinion of the Court, in which he was not bailable of right, and that the Court could not with propriety bail him in their discretion.

It appeared from the committals, in the case of Mr. Fay, that he stands charged as being accessary, before the fact, to the murder of the Rev. Mr. Butler, shot time time ago in the county of Louth, and also that he was charged with administering an illegal oath.

22.—Thursday a Privy Council sat in the Castle.

By an order of Council, the quarantine on vessels coming from American ports was taken off.

Yesterday Major-General Craig inspected, and most highly approved, the regiment raised by Colonel Fitch.

Colonel Lennox is expected from England in the course of a few days, to join his regiment (the 35th) now quartered at Cork, and under orders for embarkation.

26.—Yesterday being the day appointed for the celebration of the anniversary of her Majesty's birthday, there was a levee at the Castle.

DUBLIN, FEBRUARY 27, 1794.

Tuesday evening Mr. Douglas entertained his Excellency the Lord Lieutenant and a select party at dinner.

Amongst the noblemen and gentlemen present were:—Archbishops—Dublin, Cashel, and Tuam; the Marquis of Waterford; Earls—Granard, Shannon, Bective, Bellamont, Kingston, Portarlington, Carhampton, Clonmel and Ely; Lord Charles Fitzgerald; Viscounts—Landaff and Leitrim; Bishops—Killaloe, Ossory, and Cork; Lords—Carleton and O'Neill; the Speaker of the House of Commons; the Chief Baron; Sirs—John Parnell, Henry Cavendish, and John Blaquiere; Messrs—Beresford, Conyngham, Clements, Cuffe, and T. Jones.

(To be Continued.)

RATES OF SUBSCRIPTION

TO THE

"DUBLIN PENNY JOURNAL."

Post free to any part of Ireland, Great Britain, Australia, New Zealand, Canada, United States.

Twelve months, 6s 6d; six months, 3s 3d; Three months, 1s 8d.

Printed and published for the proprietors at 90 Middle Abbey Street, Dublin, by W. F. Dennehy, to whom all cheques and money orders should be made payable.

Dublin Penny Journal

A Magazine of Art, Archæology, Literature, and Science

Vol. I., No. 13.] DUBLIN: SATURDAY, JUNE 28, 1902. [Price One Penny.

ABBEY OF CLARE, GALWAY,

AND CASTLE OF DE BURGOS,

As they were in 1829.

In the above picture are comprised two ost ancient edifices—viz., the ruined bbey of Clare, Galway, and the ruin of 1 old adjoining castle built by the De urgos. The former was erected about 90 by John de Cogan as a Franciscan friary. It is a beautiful specimen of Gothic architecture; its high tower, raised on arches, exhibiting some exquisite features. Its remains in recent years have been carefully guarded against further dilapidation. The castle on the right was built by one of the De Burgos early in the 14th century. In the wars of 1641 it was garrisoned by the Earl of Clanricarde; in 1643 it was surprised by Captain Thomas Bourke, of Anbally; in 1651 it was taken possession of by Sir Charles Coote.

KNOCKFIERNA.

DISCOVERY OF THE BIRTHPLACE OF FINN M'CUMHAILL

By J. F. LYNCH.

III.

In "Silva Gadelica," p. 99, we read: "This then, according to archæological verity, and as experts relate it, is Finn's death; but his origin they declare variously. Some of them say that he was of the Corca Oiche in the Ua Fidhgeinte; others again assert (and this is the truth of the matter) that he was of the Ui Tairrsigh (a) of Offaley, which were of the Attacotti. . . . They of Leinster, however, state that Finn was great-grandson to Nuada Necht, and that his pedigree is this: Finn son of Cumhall son of Sualtach son of Baeisene son of Nuada Necht." Dr. O'Donovan, in his introductory letter to the "Boyish Exploits of Finn," addressed to Mr. William S. O'Brien, President of the Ossianic Society, says: "The celebrated Irish antiquary, Duald Mac Firbis, in his genealogical work, p.p. 435-436, gives various pedigrees of the famous Irish hero, Finn Mac Cumhaill. Some deduce his origin from the Orbraighe of Druim Inmocht, others from the Corco Oiche, a sept of the Ui Fidhgeinte, who were seated in the present county of Limerick. Some state that he sprung from the Ui Tairsigh of the Luaighni Teamrach of Fera Cul in Bregia, which was one of the three septs from whom the chief leader of the Fians, or Irish militia, was elected . . . but by far the greater number of the authentic Irish authorities agree in deducing the pedigree of the famous Finn Mac Cumhaill from Nuada Neacht, (b) the fourth son of Sedna Sithbhaic, the ancestor of the Kings of Leinster. In "Chronicum Scotorum," at year 552, A.D., there is entry of the battle of Cuillne, in which a number of the Corca Oche were slain, and Hennessy says that the Corca Oche were a Munster tribe in S.W. of Co. Limerick. In "Chronicum Scotorum," at year 554, is the following entry: "Birth of Molua Mac Ui Oche," from which it appears that Molua belonged to the Corca Oche.

In "Calendar of Oengus," p. cxx., mention is made of the Molua molbthach Mairge—that is, "Molua the praiseworthy of Marg"—that is, of the district of Marg. In the parish of Emly Grennan (corrupted from the Irish Bile Groidhnin), a few miles east of Kilmallock, there is a well named Tobar Molua, at which rounds are paid on August 3rd. In this parish, named also St. Malo, there was an abbey, and a Collegiate Church, which Lewis says was destroyed in 1641. In the "Calendar of Oengus," p. lxxv., we read: "Lugaid, son of Maenach, son of Fachtnae, son of Rossa, son of Erc, son of Tren, son of Duach, son of Mac Niad, son of Mac Con, son of Lugaid. Hi sunt vii Germani ejus, Bishop Brandubh, Cúsan Fachtna, Lugna Molua, Lochan in Ui Echach, Cailchine, Manchine of Cul Caiss." All these belonged to the Corca Laidhe, the so-called Attacotti (Aitheach Tuatha), really Iberians, who O'Curry says ("Lectures," p. 230), were mere rent-payers and unprivileged classes of Erinn, and by a sudden rebellion succeeded in overthrowing the power of their Gaedhilic masters. These were the Plebeians of Ara Cliach, to whom Liath Luachra (c) is stated, in "Silva Gadelica," to belong. The Iberians were the Neolithic inhabitants of Ireland; and the old stone monuments and tales of Ara Cliach must be credited to the Iberians, who are also called Mairtine. The Uaithne, of the counties of Limerick and Tipperary, were also Iberians, and their district was a portion of Ara. In "Calendar of Oengus," p. cxxviii., Molua Mac Ochai is said to be of Cluain Fertai Molua, and of Slieve Bloom, and of Druim Snechta in Fernmag; and Molua mac Ochai is stated to have been discovered when a babe in a bank of rushes, to which a man, sent thither by St. Comgall, of Bangor, gave a kick, and hence the name is said to mean "My-lua (kick), son of Ocha (armpit). This is, of course quite fanciful, and Ocha must be referred to the old tribal name, Oche, which has no connection with Ocha, "armpit," nor does Mo Lua mean "my kick," for mo "my," is a term of endearment often prefixed to the names of Irish saints. Killaloe was named from Lua, and Killaloe represents the Irish Cill do Lua, or "Church of thy Lua," who is said by Lewis to be son of Eochu Baillderg—that is, Eochu Red Spot, son of Cairthenn, who is stated in the Tripartite Life of St. Patrick to have been baptised by St. Patrick at Saingil, (d) now Singland, close to Limerick City. The old folk of this district say that a great battle will be fought between the Gaedhil and the Saxons at Singland, and that the leader of the Gaedhil will have six fingers on his right hand.. This prophecy belongs to the class of prophecies mentioned by O'Curry, "Lectures," p. 382, et seq.

Clonfert Molua, or Kyle, is stated by Lewis to be 1¾ miles from Borris-in-Ossory, and he says that there are remains in the parish of an encampment, of the old church, and of the castles of Ballaghmore and Cloneurse. The Rev. Canon Dwyer ("Diocese of Killaloe," p. 530), says: "A reference to Dr. Lanigan will satisfy those who would desire a sketch of the history of Mollua. The origin of the name of the parish is thus given (note p. 209). Cluain ferta Molua, id est latibulum mirabile S. Moluæ, eo quod ipse sua multa miracula in illa fecit, et ad huc gratia Dei per eum patrantur. The learned Dr. denies that he was ever at Finnian's School of Clonard, and asserts that he became a disciple of Comgall, of Bangor, not earlier than 550. The Dr. does not believe (No. 94, p. 209) that his rulers were taken to Rome and praised and blessed. The Church of Killaloe is supposed to have got its name from the Saint in question, either from his having lived there for some time, or from its having been dedicated to his name. This is not improbable, although far from certain. . . . This is the only parish of the Diocese of Killaloe, in Queen's County." I have given these particulars of Molua on account of his connection with the Ui Oche, or Corca Oiche, in whose territory must, I think, have been Cnoc Firinne. A short distance to the south of Cnoc Firinne is Corcomohide, the Irish Corca Muichet, "race of Muichet," who is said by Dr. Joyce to have been one of Mogh Ruith's disciples. I am very sceptical re the disciples of Mogh Ruith, and I hope, when giving account of Mr. J. J. Mahony's discoveries in the vicinity of the Well of Mogh Ruith, to give some particulars of Mogh Ruith. Corcomohide includes the parishes of Castletown-Conyers (Castletown Mac Ineiry), Dromcolloher, and Kilmeedy (Church of my Ita), from whom also is named Killeedy (or Church of Ita). It appears from the entry in "Chronicum Scotorum, at year 552, A.D., that the Corca Oiche were opposed to St. Ita of Cluain Credail (Killeedy), and so if the Corca Oiche and Corca Muichet be not the same, the territories of the two races were adjoining. In the Annals of Four Masters, O'Donovan gives some particulars of Ugaine Mor, who is stated to have had twenty-two sons and three daughters, his wife's name being Cesair. Now as Ughaine Mor belongs to the mythology, we are entitled to equate his wife, Cesair, with the Cesair, daughter of Bithu, and wife of Finntan, who is stated by Keating to have come to Ireland before the Flood. One of the

(a) Keating (Joyce's edition, p. 109), says: "Some historians say that from them (the Firbolg) are descended these three tribes who are now in Erin that are not of the Gaels—namely, the Garbruidhe of the river Suck in Connaught, the Ui Thairsidh in Crich O' bh-Failge, and the Gaileons of Leinster." Tairsidh appears to be an extended form of Tair, who is made son of Ughaine Mor. Sualtach is extension of Soalt, and so is an intensive prefix ("Corca Laidhe," p. 63). Professor Rhys connects Cumall with German himmel, but perhaps Cumal is extension of Cum; compare Finn mac Cumail with Finn mac Cubain.

(b) In "Genealogy of Corca Laidhe," p. 59, we read: "The three Fothadhs—namely, Fothadh Airetheach, Fothadh Cairptheach—i.e., Fothadh Canann, and Fothadh Dolus, were the three sons of Fuinnche, daughter of Nar, son of Fearmora of the Ara Cliach (Knockaine district), Teite, daughter of Maicniadh, son of Lughaidh, son of Daire Dearg, son of Gnathal, son of Nuada Neacht, son of Sedna Sithbhaic, was her sister." Traigh Teite is the old name of Rosscarbery Strand, and the stone circle on it, which is still there, is Lecht Teite. Nenagh, in Co. Tipperary, represents the Irish An Aenach Teite, "the Assembly of Teite."

(c) In "Silva Gadelica," p. 193, Conan maol, who is often referred to in tales of the Fenian cycle, is stated to be son of Liath Luachra, and Carn Luighdech, or "Carn of Lughaidh," where Conan clasped Finn round the shoulders, was the carn from which Knockcarron (hill of the Carn), near Emly, was named. Mr. Mahony has identified the site of the carn on the hill. In "Chronicum Scotorum," at year 858 A.D., we read: "A great host, by which Mumhan was burnt in one day, was led by Maelsechlain, son of Maelruanaidh, with the men of Erinn, so that they inflicted a defeat on the men of Mumhan, at Carn Lughdach, where Maelcroin, son of Muiredhach, half-king of the Desi, was lost." In "Todd Lecture Series," vol. iii., p. 181, we read:—

"Lugaidh Laidech, who filled the plain with his fame,
Eight years was his power in defiance:
Fell the remembered Branch of the Carn
By Aedh Buidhnech, son of Badorn."

(d) The explanation of the name Saingil, given in Tripartite Life of St. Patrick, is fanciful. The l in Saingil is a termination, and the combination ng is an extension of n, and we thus obtain source from Sin, or Sen, who is made son of Ughaine Mor, and the possessor of Luachair-Deaghaidh. Compare the account of Clanna Deaghaidh given by Connellan, "Trans. O.S. Soc.," vol. v., p. 288; the explanation of Cleitech in "Bodleian Dinnsheanchas," p. 45; the references to Sin, "Todd Lecture Series," vol. iii., p. 399; "Chronicum Scotorum," p. 43; and the references to Sidh, or Sigh, "Trans. O.S Soc.," vol. v., p. 285, and vol. iv., p. 285.

sons (e) of Ughaine Mor was named Bard, and to him was given Cluain-Corca-Oiche in Ui Fidhgeinte; this Cluain may be the place afterwards named Cluain Credail, now Killeedy. Partholon is a name which is also mentioned by Keating, at an early period, and it is, I think, explained by Professor Rhys as "top of the wave," but the Partry—i.e., Parthraighe of Co. Mayo, shows that Parth, and not Par (Barr), is the first component of the word, and Parth is to be equated with Bard. Another son of Ughaine Mor was named Marc, and on him was bestowed Midhe, or Meath, or the district which lay beside Uisnech hill.

In the "Bodleian Dinnshenchas," p. 9, and by Keating, Meath is stated to be named from Midhe, son of Brath, son of Deagh, and the name Midhe is, in "Dinnshenchas," said to be midhe, "hateful," which is connected with old Celtic mitios, Greek misos, and German meiden, by Dr. Whitley Stokes. In "Silva Gadelica," p. 576, we read: "Knockaine's history tell to me—is there here one that remembers it?—best hill (a time there was)—that stood on Ireland's wondrous land. A pleasant hill the cool Knockaine is, which once hosts, many and various, did frequent; great was their triumphing and their renown, with Ane and with Eogabal. Uainidhe and tall Eogabal were sons of Uisnech's lofty Donn."

We have seen that Donn of Cnoc Firinne was named Marc, and that the race of Marg, or Marc, was one of the five tribes that dwelt about Cnoc Aine or Sidh Eogabail; and here we have Eogabal made son of Donn of Uisnech, and as Uisnech is an extended form of Us, which is found also in name Bruis (f) (Bri Uis), in Triath-ri-thorc, (g) near town of Tipperary, we conclude that Marc was the name of the Donn of Uisnech, and it appears to me that Donn and Uisnech are merely terms which describe certain qualities of Marc or Marg. Dr. Joyce ("Irish Names," vol. ii., p. 7), says that Uisnech signifies a place of fawns; but it appears to me that this explanation cannot be accepted, and that Uisnech must be regarded as a personal name, as in the tale of Oidhe Chloinne Uisnigh, or "The Slaughter of the Children of Uisnech." In "Silva Gadelica," p. 77, it is stated that Ireland's three high gatherings were the congregation of Uisnech, at Beltane (May day), the convention of Taillte, at Lammas (first of August), and the feast of Tara, at Samhain (November Eve). In "Silva Gadelica," p. 521, Uisnech is derived from uas, "above," and nech, "a person." Mr. O'Grady explains the word midhe as "evil fire."

Professor Rhys "Hibbert Lectures," p. 192), says: "Giraldus Cambrensis, speaking of the five provinces into which Ireland used to be divided when Meath was reckoned one of them, uses the following words with regard to the hill of Uisnech: "Et eam (Hiberniam) vacuam invenientes, in quinque portiones æquales inter se diviserunt: quarum capita in lapide quodam conveniunt apud mediam juxta castrum de Kiliar, qui lapis et umbilicus Hiberniæ dicitur, quasi in medico (h), et meditullio terræ positus." The stone is described as a very large one, and it is believed to have been cursed by St. Patrick on account of the pagan worship there; or, more correctly speaking, the Stones of Uisnech—for there were more than one—became so accursed, owing to the Saint's malediction, that they never failed to prove the ruin of any structure into which they happened to be built." In "Silva Gadelica," p. 170, there is a reference to the pillar stone on the top of Uisnech, and at p. 158, mention is made of the muc shlangha, or "prophylactic pig," which is stated to be the last prophylactic pig that was distributed among the men of Ireland. The great chiefs and kings of Ireland sat in a circle when at Uisnech, and the kings paid the "hero's ring" of red gold for seat ("Book of Rights," p. 7). La Beltine was the day of the ring—that is, of the year, and hence the buinde niad, or hero's ring of Uisnech.

(To be Continued.)

(e) Clin Mail, the district south of Knockaine, is stated to be named from Muireadhach Mal, son of Ughaine Mor. Gleann Aeife, north of Galbally, was named from Aeife, or Aifi ("Wars G. G.," p. 93), daughter of Ughaine Mor. Treitherne, near town of Tipperary, was named from Triath, son of Ughaine Mor. Moenmhagh, in Galway, is said to be named from Moen, son of Ughaine Mor; but Keating says that Moenmhagh was named from Moen, son of Ugh Mor. It appears to me that Ugh, which is also written Uath, Hu, and U, has been extended to Ughaine. In the "Bodleian Dinnshenchas," p. 10, Erin is said to be daughter of U Mor, and foster-mother of Midhe; and in the "Edinburgh Dinnshenchas," p. 55, Ane is daughter of Uath, and foster-mother of Finnchad. In the "Chronicum Scotorum," p. 3, Erin is said to be another name for Cesair.

(f) In the Life of St. Brendan, the Navigator, Mount Bruis is given in form Bri Uis, or "hill of Us."

(g) Keating ("Joyce's Edition," p. 125), says: "Among these noble females were the two royal poetesses—viz., Fe and Meann their names; it is from them is named Magh Feimhin in Munster. Belonging to them also was Triath-rithore, from whom is called Treitheirne of Munster." For Muscraidhe Treitheirne (see "Book of Rights," p. 45). Keating's explanation of Magh Feimhin is not correct, but there is a Magh Fea, in Co. Carlow, which was bestowed on Fuilne, son of Ughaine Mor. Airgeatross, or "Silver-wood," beside the river Nore, was given to Cinga, son of Ughaine Mor; but in "Trans. O.S. Soc., vol. v., p. 287, Cinga, son of Ugh Mor, is said to have obtained Iath Oigle, or "district of Oigle." Cruachan Oigle was old name of Croagh Patrick, in Co. Mayo.

(h) Perhaps Midhe or Meath is derived from an old Irish word cognate with the Latin medius, Greek mesos, Slavonian mezda, Sanskirt madhyas, Anglo-Saxon midd, Gothic midjis. The present Irish word meadhon, "middle," may be derived from the Latin medius. Keating also suggests that Midhe is the Irish meidhe, "a neck," because it is of a meidhe or neck of each province that Tuathol Teachthor cut it.

DON ISLE.*

BY SARAH HELEN WHITMAN.

Lonely beneath the silent stars
It stands, a gray and mouldering pile,
Wrecked in the wild Cromwellian wars,
The sea-girt castle of Don Isle.
The wild waves beat the castle wall,
And bathe the rocks with ceaseless showers;
Dark heaving billows plunge and fall
In whitening foam beneath the towers.

High beetling o'er the headland's brow,
All seamed and battle-scarred it stands,
And rents and gaping ruins show
The ravage of the spoiler's hands.
Two hundred years have rolled away,
And still at twilight's haunted hour
A ghostly lady seems to stray
By ruined barbacan and tower.

Dauntless within her own domain
She held at bay her father's foe,
Till faithless followers fired the train
That laid her feudal fortress low;
Afar her exiled children roam;
She perished in the smouldering pile,
The last of all her house and home,
The lonely lady of Don Isle.

The gray moss gathers on the wall,
And low beneath the crowning stars
The crumbling turrets waste and fall,
Wrecked in the wild Cromwellian wars;
And peasants round their evening fire
With many a tale the hours beguile,
Of warrior ghosts and spectres dire
That haunt the castle of Don Isle.

*Cromwell's siege of the sea-girt castle and fortress of Don Isle, which was heroically defended by a female descendant of Nicholas Le Poer, Baron of Don Isle, is represented by Sir Bernard Burke in his "Romance of Irish History," as full of legendary interest.

OLD ROMAN ROADS.

Milestones were erected along the entire length of the military road. They were usually columnar in shape, though the cippus milestone is found frequently. From personal observation I know only the milestones of Asia Minor and Syria. These are round monolithic columns, about 7 to 9 feet high, with a diameter at the base of 2½ to 4 feet, but tapering off to 1½ feet at the blunty rounded top. They are roughly hewn, and inscribed with the name and full titles of the Emperor during whose reign the road was built, in Asia Minor usually a proprietor, during whose term of office the actual building or repairing was done. Beneath this inscription the distance was engraved, oftenest with no statement as to the place from which the distance was measured, though sometimes both the starting point and the objective point were given.

The Roman milestones are of great value, not merely in order to locate in a general way the line of lapsed and forgotten roads, and for fixing the various starting points of the Roman system in such countries as Asia Minor and Syria, but they are also of importance for the reconstruction of provincial or local history, geography, and chronology.

In the course of time the road's top dressing of gravel and cement wore away, and costly repairs had to be made by the provincial Governor, who, eager to claim all honour due himself, caused the fact of his restitution (vias et pontes restituit is one of the stock phrases) to be engraved on the milestones. Accordingly, it often happened that this new inscription was engraved directly over or else overlapped the original inscription. Sometimes as many as three inscriptions occupy the same space on the stone.

"All roads lead to Rome." Therefore, the military roads centred in Rome and spread out in a vast network that embraced all the provinces of Europe, Asia, Africa, and the islands, such as Britannia, Sicily, Sardinia, etc. Distances along the roads of Italy were, of course, measured from Rome. The central milestone was the miliarium aureum, erected by Augustus in the forum. It has been recognised by some in certain remains near the arch of Septimus Severus. But the Governmental centres of the provinces were also centres of the provincial road systems, and miliaria aurea were erected in all these centres, such as Milan (for Gallia Cisalpina), Lyons (for Gallia Celtica), Rheims (for Gallia Belgica), Tavium (for Cappadocia), Melitene (for Armenia), Palmyra (for Palmyrene).

In conclusion, it must be remarked that all streams crossed by military roads were spanned by bridges, of which there were three kinds—those made entirely of wood, and those made of stone and wood, and those made of stone throughout. Many of the all-stone bridges are still in use. Several of them span the Tiber to this day, both in and outside Rome. Not only this, but Roman bridges are still used by semi-barbarous peoples who, perhaps, have never even so much as heard the name of Rome. A silent, but eloquent reminder of Rome's solicitude even for her most distant provinces is the noble Roman bridge at Kiakhta, in Kommagene. Every stone of the defiant old bridge is vocal, telling in pathetic wise of the inevitable passing of human glory, pomp, and power.

The retardation or load coils invented by Prof. M. I. Pupin have been put into practical use on a line of about 1,000 miles in length. Three long-distance lines between Chicago and New York have been fitted with the load coils. It is said that the loudness of transmission has been increased by about a hundred per cent. Prof. Pupin hopes that by the use of his coils it will soon be possible to carry on a conversation between New York and San Francisco.

THE FENIAN TRADITIONS;

OR,

SLIABH - NA - M - BAN.

BY JOHN DUNNE.

I.

Our distinguished countryman, Dr. Wilde, in one of his interesting chapters on Irish popular superstitions, mourns over the loss of our old fairy-lore which is certain to result from the removal of so large a portion of the population through emigration, etc., etc. There are few, doubtless, who would refuse to sympathise in the learned gentleman's regretful feeling on this subject, or to acknowledge that his anticipations are but too likely to be well founded. But it appears to me that the curious old fairy legends of our country, much as their loss should be deplored, were never half as valuable or as interesting as the traditions which have long lingered amongst our peasantry concerning the primæval inhabitants of Ireland, the total obliteration of which is now, unfortunately, threatened from the same causes. The pre-historic annals of this kingdom, which remain yet to be properly compiled, must be drawn not alone from the appearance of the existing primæval monuments, but from the vivid traditions connected with them, long handed down from sire to son, in the localities in which they are placed, and which, though many of their features were marvellous, incongruous, or impossible of occurrence, are far from being worthless as aids to a proper investigation of that important subject. With such materials much may yet be done towards the elucidation of remote events in our national history; and though a very large proportion must, unquestionably, be thrown aside as profitless chaff from amongst it, many valuable grains of corn may be sifted. The elf-lore, which was once a characteristic of our country, will, doubtless, be lost or forgotten from the circumstances to which Dr. Hyde has alluded; but Irish elf-lore has had many cordial chroniclers, and Crofton Croker's gleanings, and the researches of several other eminent writers, will preserve the memory of our most remarkable fairy legends so long as English literature endures. Not so, however, our Fenian traditions—few have thought it worth their while to inquire after and preserve a single incident, however romantic, nationally characteristic, or locally interesting; and, with the succession of disastrous years through which this land has now passed, it must be obvious that much of this lore which was unwritten has been obliterated: indeed, unless some strenuous effort be now made to collect the Fenian tales remaining in the memory of our people, with the present generation such of them as are not already preserved amongst the ancient manuscript Ossianic poems will certainly pass away. Under this impression, it is my wish to place on record such of the traditions of Sliabh-na-m-ban as I have heard related in the district. Unfortunately, my researches cannot be now made with such facility as in by-gone days—and those not remote either—when the farmer and his group of labourers, from all parts of the country, sat down in the evening, their day of toil being over, with light hearts before a blazing turf fire and a sciach of smiling potatoes, and recounted in turn the tales of the olden time handed down to them from their fathers. Now, alas! the story-telling peasant is in his grave, the poor-house, or the wilds of America. Nevertheless, I hope to rescue from oblivion some old-world stories of my native district, Kilkenny.

As Sliabh-na-m-ban mountain, commonly termed by the Irish-speaking people Sliabh-na-m-ban-fionn, is the most prominent object in the locality, and the site of many of the most famous exploits of the traditionary hero, Fionn Mac Cumhail, I believe I cannot begin more suitably than by noticing a legend referring to the origin of its name. The story of the pedestrian race up the heathy acclivity of a portion of the mountain by the fairest ladies of Ireland, Fionn's hand in wedlock being the prize of the winner, was one of the most frequently told in the locality from my infancy upwards. Some of the deepest read of our seannchaidhes seem inclined to despise the legend, as it has never been found amongst the ancient written metrical romances, but as my task is to glean the existing oral traditions of a locality, I see no reason why I should treat this, the most popular amongst them, with contemptuous silence. The story has been briefly, and rather incorrectly, printed by Mr. and Mrs. S. C. Hall, in a note to their "Ireland, its Scenery, Character, etc.," and alluded to by other writers for aught I know; but I wish to state it correctly here. Fionn, as the tale goes, like many a modern "gallant gay," had from time to time paid his addresses to several of the fairest belles of his day, on all of whose hearts he had made a strong impression, but without actually committing himself to any by asking the important question which decides such delicate affairs. Each fond lady fondly flattered herself that she would be the chosen bride of the great chieftain, but each, of course, hated her numberless rivals, and the result was a general quarrel amongst them, carried on with such implacable acrimony as threatened to throw the whole country into a hopeless embroilment. Fionn saw that with him alone rested the power of putting an end to this very unpleasant controversy, but as it was possible that he could only please one of his admirers by taking her hand, and he was sure to make relentless enemies of all the rest—a consummation which he by no means devoutly wished—he found himself placed in a very unpleasant position, to relieve himself from which it was necessary that some stratagem should be resorted to without delay. Accordingly, he made a public declaration of equal affection and admiration of all the numerous candidates for his hand, but announced that, as he could not marry them all, he would leave the decision of the important question to the agility of their own pretty feet. Sliabh-na-m-ban was chosen as the site of the memorable race, and the chieftain himself stood at the top of the hill to receive and proclaim the successful competitor. Amongst the bevy of beauties, however, there was one whose charms had made a deeper impression upon the hero's heart than all the rest, and to her he did not scruple to whisper in private a word of advice, by adopting which she might be certain to gain the much coveted prize. This lady was Graine, or Grace, the beauteous daughter of Cormac Ulfhada, monarch of Ireland; and the counsel which her lover gave her was simply this, that she should not attempt to run too fast in the outset, so as to exhaust her breath. The advice was strictly followed. Graine for some moments appeared to have been left far behind by all the other runners, who put forth their utmost strength at once to breast the acclivity. The exertion, however, was too much for them; soon they became heated, lost breath, and finally sank down one after another, completely exhausted, on the heath; and had the mortification to see the princess, who had at first seemed to make but little way, pass by them fresh and unruffled, and smiling triumphantly in full consciousness of possessing the secret of success. Several made a last effort again to outstrip her, but in vain; for she alone gained the summit and won the much coveted prize. The princess had now gained as firm possession of the chieftain's hand, as formerly she had won his heart, and a long life of connubial bliss was fondly anticipated for the distinguished pair. But the lady proved as frail and false as her lord was chivalrous and confiding, and after the expiration of a few short months she eloped with the most cherished friend of her husband, Diarmuid O'Duibhne.

Many of the peasantry in recounting this legend will insist that the princess possessed no personal attraction, but quite the reverse, and that, therefore, the preference bestowed upon her by Fionn can only be accounted for on the supposition that she had recourse to magic arts to gain that end. These people, however, confound the name of Graine, which signifies Grace, with grana, which means ugly, and from this false conclusion draw the inference of the lady's want of beauty. (a)

(a) However this may be, the belief is general amongst a large proportion of the peasantry, that Graine was by no means the beautiful personage which others represent her, and that Fionn was anything but pleased at her success in the race. The following is the version current in the barony of Iverk:—"The name of Sliabh-na-m-ban is said to have been derived from the following traditionary circumstance. From amongst the numerous princesses and beautiful young woman to whom Fionn Mac Cumhail had paid attentions in Ireland and foreign nations, he selected twenty-one, either for their superior personal attractions, or the influence of their family connection, from which to chose his wife, and they were thus to compete for his hand:—On an appointed day the twenty-one young women were to stand in a row at the foot of Sliabh-na-m-ban, and upon a given signal to run up the mountain, the first who should arrive at Mullach-suidhe-Finn, to become the wife of the king of the Fenians. There was not among the candidates a less comely woman than Grana, nor one less concerned for the success of the race, as she considered it impossible she could be the winner, in consequence of the fame which several of the beautiful competitors had acquired for speed, it being commonly reported that some of them could run before the wind and leave it far behind them! They all stood in anxious expectation awaiting the signal, except Grana, who took her place in hopeless indifference. Fionn stood at the table, or bord, at the summit of the mountain, and having blown a loud blast upon his trumpet, the racers set off at full speed; Grana, however, walked carefully and slowly after them. Shortly the first in the race dropped down on the path, fainting from over-exertion; the next young woman passed her for a short distance, and then fell exhausted also. In this manner, to the number of twenty, they fell one after another before they had come within sight of Fionn. Grana then easily passed them, several trying to rise and move again, but dying in their struggles. At last Grana passed them all, and arrived at Bord-suidhe-Finn, where she was acknowledged as the queen of Fionn. The chieftain, however, was far from being pleased at this result, and immediately expressed his disappointment by these bitter words: "Never may be your welcome to me, Grana, without beauty or attractions." Grana was the mother of Ossian, but Fionn is said never to have loved either the mother or son, and in revenge for his infidelity, she eloped with Diarmuid O'Duibhne."

But if she was not ugly in person, she was, at least, false in heart and mind, verifying by her conduct the truth of the proverb: "Beauty and virtue are not always found together." Nevertheless, before condemning the lady altogether, she ought to be allowed the benefit of a very important extenuating circumstance. It appears from universal tradition that Diarmuid, who was called from his swiftness "The swiftest footman amongst the Fenians," from his gallantry, "Diarmuid of the women," and from his personal beauty, "The white-toothed bright-skinned Diarmuid O'Duibhne," was endowed with a supernatural attribute. He possessed on his breast a ball-rearc—i.e., an Irish "beauty spot," which contained so great a charm that no woman could look upon it without loving him, and being compelled to accompany him whithersoever he wished to go. Thus the peasantry admit, that Graine having chanced to see the "beauty-spot" on Diarmuid's breast, needs must follow him, even "through fire and water." This Diarmuid is not only connected with the Sliabh-na-m-ban district through the circumstance of his elopement with Graine, but by many additional traditions which refer to his military and other achievements in the locality, and even his sepulchre was, till its recent destruction, pointed out in the adjoining barony of Knocktopher. (b)

However, with respect to the derivation of Sliabh-na-m-ban, from which the loves of Graine and Diarmuid have caused me to wander, it is averred by tradition that the name of the mountain is derived from the circumstance of the race of the ladies up its side, and the vast numbers of the fair sex which assembled on the occasion to witness that event, Sliabh-na-m-ban literally meaning "the mountain of women." Mrs. Hall observes, "Slieve-na-man is called in Irish 'Sliabh na mban fionn na heirin'—i.e., 'the mountain of the fair women of Ireland,' for which appellation tradition assigns the whimsical origin," which is above stated. The word fionn, as an adjective, certainly means fair, white, or pale, and is usually applied by the peasantry to whitish hair, which they call gruaig fhionn.

The people of the locality, however, Mrs Hall's testimony notwithstanding, will have it that the word here does not allude to the ladies at all, but to the general of the Fenian heroes himself, and that Sliabh-na-m-ban-fionn should be translated "the mountain of Fionn's women." There is a serious grammatical difficulty in the reading, as Fionn in the genitive case would be Finn; nevertheless, the late Mr. Michael Mullally, of Cappaghmore, an excellent Irish scholar, espoused the popular view of the matter; and as he justly was deemed the best authority on such matters in the ancient barony of Compsey, I would not presume to contravene his statement, were it not that one of the first living Irish scholars, Dr. O'Donovan, I find has intimated (c) that all the theories hitherto indulged in with respect to the name of the mountain, are incorrect, and that the word fionn is a corruption of Feimheann, the original appellation of the district to which Sliabh-na-m-ban is adjacent, and the true translation of its name is "The mountain of the women of Feimheann."

Before quitting the subject of the derivation of Sliabh-na-m-ban, however, it may be well to notice another error on the subject into which a writer on Irish antiquities, once looked up to as an authority, has fallen. General Vallancey, speaking of the Scythian religion, observes that the ceremonies pertaining to their worship were comprehended in the word Haman or Mann. From this word Mann, he says, many of our mountains receive their names. "Take an old Irish fable still in every one's mouth of Sliabh-na-Mann mountain. They say it was first inhabited by foreigners, who came from very distant countries; that they were of both sexes, and taught the Irish the art of O Shiris, or Ouris —that is the management of flax and hemp, of cattle, and of tillage. They all wore horns according to their dignity; the chief had five horns. The word Ouris now means a meeting of girls at one house, or barn, to card a quantity of wool, or to spin a quantity of flax, and sometimes there are a hundred together. Wherever there is an Ouris, the Mann come invisible and assist."—"Collectanea de Rebus Hibernicis," vol. iv., pref. p. viii., note. Now, the very name of the mountain in question, proves this derivation to be erroneous, for it is never pronounced Sliabh-na-man in Irish, but always Sliabh-na-mon, the article na properly referring to m-ban, the genitive plural of bean—woman. Ouris, properly spelt abhras, literally means yarn of any kind, and by it is also understood the custom treated of in the above passage, which has been copied by Lady Morgan into her "Wild Irish Girl." Her ladyship tells us that General Vallancey, ingeniously traces those conventions of female industry called Ouris, to a Scythian origin, but it is not likely that the Scoto-Milesians, who in their various migrations proceeded from Scythia to Ireland, had any occasion to be instructed in the management of flax by the 'foreigners' who, according to the legend, 'had first inhabited the Sliabh-na-Mann-mountain.'" I must say I fully agree with Lady Morgan, and I may further add, that in any story, relating to this mountain, I have never heard of "the Mann" or of their coming, either visibly or invisibly, to assist the Irish girls at their spinning matches. There is, however, a curious tradition told of certain supernatural spinners connected with Sliabh-na-m-ban, which may have supplied the ground-work upon which fanciful antiquaries have built some of their whimsical theories as to the name of the mountain; and as I have now disposed of Mrs. Hall's "fair women" and General Vallancey's "invisible Mann," I will proceed to narrate the tale, which will serve to illustrate some local popular superstitions, as well as a traditionary statement of the people that one of the lesser eminences of the group, and not the highest of the Sliabh-na-m-ban hills, was the "mountain of the women."

One night, very many years ago, two industrious females were engaged in spinning flax in a cabin at Gortnapise, (d) in the vale of Compsey, near the base of Sliabh-na-m-ban mountain. All the rest of the family had been long in bed, but they being intent on finishing some task which they had undertaken, hard work was the order of the night, and all gossip was suspended, except during an occasional intermission, when the bright turf fire was raked out to obtain "a soft spark" to kindle the dudeen. It was during one of these sociable intervals, whilst the wind moaned through keyhole and crevice, that the smokers were disturbed by an unusual knocking at the door. Knock succeeded knock with dull and heavy sounds for some minutes, but in vain; the affrighted women made no reply. At length a shrill hoarse voice asked loudly: "Are you within, feet-water?". "I am! I am!" was responded immediately from an old pot in the corner of the kitchen, in which the family had washed their feet before retiring to rest. "Do you hear? list! what the devil's in the pot?" whispered one of the spinners, in a tremulous tone. "Oh! I don't know, my heart is beating!" was the faint reply. A dabbling noise was next heard from the pot, and some supernatural being in an eel-like form, began to uncoil itself and stretch forward in the direction of the door, which it immediately opened, and in a second several women, strangely attired, and of extraordinary aspect, stood before the trembling spinners. Without apology for the intrusion, some of the unbidden visitors began to amuse themselves with the wheels, cards, etc. The women

(b) See paper on "Giants' Graves" in the Transactions for 1894, p. 14, where the tradition is given respecting the death of Diarmuid.

(c) As Dr. O'Donovan's remarks upon the meaning and derivation of Sliabh-na-m-ban-fionn cannot fail to prove interesting, we consider it well to give them here:—"Fionn Mac Cumhail's name has nothing to do with that of the mountain. If fionn, the lost portion of the compound, meant 'of Fionn,' then it should be in the genitive form, Finn. The natives of the counties of Kilkenny, Tipperary, Waterford, and Limerick, all call the mountain Sliabh-na-m-ban-fion—i.e., 'mountain of the fair (haired) women'—but they never call it Sliabh-na-m-ban-Finn. This is a fact, and so far the living language is a witness that the mountain was not called after Fionn Mac Cumhail, or any other man. But when the people interpret Sliabh-na-m-ban-fionn as meaning 'mountain of Fionn's women,' they are wrong, because the words conuld not bear that interpretation. Again, Sliabh-na-m-ban-Finn (i.e., of Fionn) would be bad Irish, because the following rule is always adhered to in the modern Irish—'When two substantives come together, one governing the other in the genitive case, the article cannot be used before the governing noun.' It is fair to give the name by which the people call the mountain, but it would be wrong to translate it incorrectly. 'The mountain of Fionn's women' would be Sliabh-ban-Fhinn, pronounced Slie-bon-een; no other form would express it. Sliabh-na-m-ban-fionn is pronounced Slie-na-mon-feunn, and this form could not mean 'mountain of Fionn's women,' but mons fon fæminarum candidarum. This is very clear to every grammatical Irish scholar. 'The Book of Lismore,' as well as other ancient Irish manuscripts, contains a metrical romance, from which it appears that the Tuatha De Danann women of the Sidh of this mountain, who enchanted Fionn and his Fianna, gave it its name. The fairy palace of these women, on the east shoulder of the mountain, is there called Sidh ban Feimheann—i.e., the sidh or fairy palace of the women of Feimheann. The mountain itself is called Sliabh-ban-Feimheann, or Sliabh-na-m-ban simply. If the second genitive is used, the article must be rejected. Magh Feimheann—i.e., 'the plain of Feimheann, was exactly co-extensive with the barony of Iffa and Offa East, and this mountain formed its northern boundary. I do not believe that Sliabh-na-m-ban-fionn or Feimheann, is its primitive name; I have reason to believe that it was originally called Sliabh Dile." Dr. O'Donovan considers the story of the lady-race (which is not to be met with in any of the ancient Irish MSS. romances) a comparatively modern tale, which entirely originated in the mistake as to the meaning of a portion of the name of the mountain.

(d) Gort-na-pise (pronounced Gorth-na-pische), near Sliabh-na-m-ban. I presume that this is the place called Gortnapissi, where a bloody battle was fought in the reign of Queen Elizabeth, "ten battalions of the English being cut to pieces" by Sir John Desmond at the head of the Irish army. (See Abbe Mac Geoghegan's "History of Ireland," Dublin, 1844, p. 472).

of the house were quite dismayed at this visitation, but endeavoured to dissemble their fears; and one, under pretence of fetching a few sods of turf from a shed in the yard, walked out, but soon returned in a hurry, exclaiming: "Sliabh-na-m-ban fionn and the great mountain over it are on fire!" This exclamation had a talismanic effect on the unwelcome visitors, who ran out uttering exclamations of alarm. The two women then lost not a moment in locking the door, and obeying some directions mysteriously conveyed to her who had left the house for the turf, as to the precautions to be taken against fairy influence, they thrust the tongs into one of the staples, laid the broom against the door, threw a spark from the fire into the bathing water, plucked a quill from one of the wings of a speckled hen, took the band from off the spinning-wheel, placed the carded flax, or abhras, under a weight, raked up the fire, and jumped into bed. Scarcely, however, had they got their heads under the coverlet, when the mysterious females returned, and were heard calling out, in Irish as before: "Let me in, feet-water." The immediate response from within was, in the same language: "No, I cannot, for there is a spark in me." Then the applications of the fairy women were addressed to the other objects in turn: "Let me in, tongs," "Let me in, broom," "Let me in, speckled hen, "Let me in, wheel-band," "Let me in, abhras." Each of these answered that it was out of their power, assigning as the reason the precaution taken in the disposition made of them by the owners of the house. The unearthly visitants then raised a yell of disappointment, and departed without their expected victims. This strange legend is always cited in the district as the origin of the very prevalent custom amongst the peasantry there, of throwing a spark of fire into any vessel in which a person's feet have been bathed at night; and to this day the whizzing of a red sod in a pot of hot water is music to the ears of every old woman in Crimpsey, from the assurance therefrom derived that the house is thus defended from the visitation of the "good people."(e)

(To be Continued.)

(e) The practice of putting a spark of fire in foot-water, to protect the premises from the power of the fairies was till not so long ago prevalent in the north as well as the south of Ireland, and may, perhaps, be still kept up.

LITERARY SCRAP BOOKS.

The following hints, we believe, worth attention from those who have the excellent practice of making scrap-books of cuttings from readings on subjects which interest them or are within the range of their studies:—In the choice of scrap-books beware of the gaudily bound affairs with which the market is flooded. They are poorly bound and go to pieces before they are half filled with scraps. What is even worse, the pages are made of thick wood-pulp paper, which dries, cracks, and breaks ere a year has gone by. I have seen scores of nice-looking scrap-books which were masses of fragments by the time the last page was pasted with clippings. The only kinds of paper which should be used are either the best linen or else Manila hemp. Literary people may profit by the usages in business offices. The books there which are made for the heaviest wear and tear have their pages of yellow or brown Manila hemp paper. This is particularly the case with all first-class invoice books, which will last till the day of doom. Most of them will outlast their bindings, and for this reason nearly all are so constructed that the heavy canvas bindings can be removed without trouble and handsomer ones put on when so desired. What is more, they are very economical. A 250-page invoice-book costs five or six shillings, which is less than most of the pretty parlour-table affairs, which contain but a hundred pages and the poorest wood-pulp paper.

OUR WEEKLY STORY

THE SUNKEN TREASURE.

In 1863-4 a great treasure, to the value of nearly one million dollars in gold coin and bullion, was recovered from the wreck of the Pacific mail-ship, "Golden Gate." I have the story direct from one of the principal men of the enterprise. During the period which elapsed between the discovery of gold in California and the establishment of transcontinental traffic, the custom was to ship coin and bullion from San Francisco to the Isthmus of Panama, across which it was carried to Aspinwall, now Colon, on the Atlantic. There it would be reshipped to its destination in the United States or Europe.

Thus in July, 1862, the side-wheel steamship, "Golden Gate," was en route from San Francisco to Panama, carrying more than five hundred passengers and a large amount of treasure. While running along the west coast of Mexico, about two miles offshore, she was discovered to be afire. She was headed for the beach, and when she struck the fire had so enwrapped her that all on board were forced to fling themselves into the surf. There was a vicious undertow. Two hundred and twenty-eight people were lost, and of the vessel herself, in a short time nothing remained in sight except some of the tall machinery.

After the wreck became known, it was announced that there had been a million and a half dollars' worth of gold in the treasure-room of the "Golden Gate." The underwriters sent skilled divers to the scene to attempt the recovery of this treasure.

The divers, after a prolonged examination, reported that the vessel had broken in two at the treasure-room, and that the gold had been buried so deep in the sand, through the combined action of the surf and the undertow, that the recovery of any portion of it was impossible. The underwriters thereupon abandoned the attempt.

A number of adventurous spirits in San Francisco, upon learning of this report, determined to make a personal examination of the wreck. This they did in August, 1862, and corroborated the report of the previous divers.

A second expedition went down, and although not successful, brought back reports that furnished encouragement for a third, which started from San Francico in October. 1863.

This expedition sailed in two schooners, the "R. B. Potter," a former pilot-boat of seventy tons, and the "Naiad," a little craft of thirty tons, previously used for collecting gulls' eggs from the Farallone Islands. There were ten men on each vessel, including divers and engineers, and there was all the necessary apparatus.

The diving apparatus was put into shape; the two schooners were moored at a safe distance from the breakers; the air-pump, with its attendants, was placed in position on the launch; and one of the divers, in his submarine suit, dropped over the side, but did not vanish. Since the water was but four fathoms deep, and clear as crystal, he could easily be seen as he walked along the bottom towards the wreck. A stream of air-bubbles rose behind him, and fish and sharks fled from him in every direction.

As he approached the wreck and found shallower water with each step, it was seen that the furious surf and the undertow forced him by degrees to stoop until he was crawling along on all fours. When he was directly over the wreck, he began to employ the ingenious apparatus to which the adventurers looked for success.

This apparatus consisted of a brass pipe, with a nozzle two and one-half inches in diameter, which was attached to five hundred feet of hose leading to a steam-pump on board the "Naiad. A continuous stream of water, as powerful as that from a fire-engine, was to be forced through the hose; and this, it was hoped, would roil the sand to such a state that the diver could gradually settle down into it and lay hold of the treasure.

As soon as he reached the place where he was to work, the diver gave the signal to start the pump.

After an hour of expectancy by those above, the diver signalled to stop the pump, and then came to the surface. After being relieved of his helmet, he drew in a few breaths of fresh air and reported:

"Everything is all right so far, but there is a lot more work to be done than we bargained for. The sand has accumulated so that where we expected two or three feet, there are almost six. Under this is the coal, and in it we shall find the boxes of gold, if we ever find them.

"The experiment with the hose worked well," he continued. "I kept playing the nozzle under and about my legs, and sank three feet easily. But I tell you, there's danger for a diver in this thing. If the steam-pump ever stops working while a man is deep in the roiled-up sand, he will be caught there sure, for the sand will grow solid about him before he can get out."

The men had not thought of this before, but they at once saw the truth of it, and arranged that every imaginable precaution should be taken to keep the pump working.

Both divers descended on the second day, but after considerable time reappeared with no more encouraging news than that one of them had got down into the sand to the depth of his armpits without discovering anything. During the following week the search went on with no success. The divers found that the stream from the hose did not thin the sand enough to enable them to bend down in it and grope about their feet. The stream made a hole for them to sink in, but it was not wide enough to stoop in, and it was filled with a mixture of sand and water, ready to "set" the moment the stream should stop. So the men employed their feet as hands, groping about for the treasure-boxes.

The time passed thus until Thanksgiving Day. Then the hopes of the party, who had ventured most of their savings in the enterprise, were very low, but the divers were encased as usual for the regular descents. On this morning one of them remarked:

"Boys, I am going to touch the coal to-day if I have to go my full length for it. We're needing something special to be thankful for."

It was three hours before he signalled to stop the pump. With their expectations roused by his unusual stay, the others waited eagerly for a signal to send down a bag of such implements as the diver might need to assist him in raising a box of treasure. A small, flat boat, containing two men and grapnels, ice-tongs, and such implements, were always kept moored over the spot where the diver was at work. Soon the hopes of those above were destroyed by the announcement that the diver was coming to the surface.

The diver, however, had planned a most agreeable disappointment, He who tells me this story remembers being struck by the fact that as the diver ascended the ladder to the side of the launch, he used but one hand to assist himself. When he emerged, his friends saw a package under one of his arms, and this he handed up to those on board.

The box, about a foot long, eight inches in

width, was carried over to the "Potter," opened, and found to contain three thousand five hundred dollars in gold coin.

To obtain this box, the diver had been obliged to sink himself until the top of his head was just level with the surface of the sand. Feeling something hard beneath him, he worked it about for a long time with his feet, until, finally, with the assistance of some hooks he had carried down with him, he had raised it to a point where he could get his hand on it. While there he had sent up several signals of assurance, which his tenders had never received, no doubt because his life-line had been buried in the firm sand which surrounded the roily hole.

Great progress was now made. The next day, with the assistance of grapnels and bags, more treasure was discovered, and then, day after day, two, three, and even four boxes, containing various amounts, were extricated from the sand by the labour of both divers. With each box they had to mount slowly out of the hole they had bored, and allow the sand to fill in and harden behind them.

Elated with success, the divers, as was natural, relaxed their precautions a little, until one of them had a perilous adventure. Standing over the wreck, he was boring his excavation with the hose, and sinking rapidly into the sand as usual.

Just as he got down to his shoulders, the butt of the hose was suddenly torn from his grasp by the surf. As he groped about on the sand, expecting to feel it, he remembered with a shock that before beginning operations, he had neglected the customary precaution of attaching the hose to his belt by a lanyard. The whole thing had been washed far beyond his reach.

Almost instantly the sand, no longer loosened by the stream of water, began to harden round him, and he realised the full horror of his situation.

So quickly was he embedded, that the use of his arms was soon lost; nothing protruded from the solid sand except his helmeted head, hands, and wrists. With his life-line buried and his arms powerless, he was unable to make any signal for relief to those above, who were quite unaware of his dreadful situation. Besides all this, owing to the disturbance created around him by the surf and the undertow, he might as well have been blind for all that he could see.

The pressure of sand on his chest was so severe that he began to lose breath, and resigned himself to the speedy, agonizing death which appeared inevitable. Nearly exhausted, he felt something touch one of his hands. It was the bight of the hose, which, in washing about over the bottom, had struck against him —a thing not likely to happen once in a thousand times.

Gripping this with his hand, he slowly edged it along, bit by bit, until finally he got hold of the butt and the nozzle itself. With great difficulty he turned the stream of water into the sand, and freed first one arm, then the other, and gradually the whole upper part of his body.

Through the remainder of the day he was prostrated, but he pluckily went back to the work the next day, and from that time on there was no lack of precaution on his part.

A later incident, in which the other diver figured, indicates well to what a degree the success of the expedition was due to the pluck, persistence, and hard work, of the divers. In raising one large box of treasure from the hole in the sand, the tongs by which he held it slipped, and ripped the cover entirely off the box while it was yet a foot from the top of the hole.

But by the greatest care and pains he finally succeeded in resting it on the level sand outside the hole without spilling a single coin. It was hauled up to the boat in a bag, and found to contain nearly thirty thousand dollars. Of course the weight of these boxes in the mixture of sand and water was far less than it would have been in the air.

Uninterrupted by other accidents, the work of recovery went on until the first of January, when the increase of surf, with the change of season, made further operations impossible. The last box of treasure was extricated on Christmas Day, and although regular trips below were made during the week that followed, no more boxes were brought to the surface. Then the men stopped their work and left the spot, fully intending to repeat the operations in the following year; but during the winter the party scattered far and wide, and were never reunited.

Many schemes for obtaining the rest of the treasure, by dredging, building breakwaters, or inserting coffer-dams, have been talked about, but no one has yet recovered a dollar of what the San Francisco sailormen failed to lift; nor has any one produced a scheme which, in the opinion of the man who told me this story, will warrant the outlay of the capital necessary to secure what is left of the treasure of the "Golden Gate."

MALOGA'S HOLY WELL.

BY EUGENE GEARY.

I loved to stray where Funcheon's stream
  Winds thro' fair meadows, vernal dressed,
And watch the sunlight's farewell gleam
  When cloud-isles floated in the west;
No place was there that nursed its tide,
  On which I dearer loved to dwell,
Than when entranced, I stood beside
    Maloga's Holy Well.

The cloister, ivy-clad, looked down
  In solemn splendor o'er the scene—
On tombs time-worn to gray or brown—
  Memorials of what once had been.
The shadow of the hawthorn tree
  Upon its mystic waters fell,
And wrapped in beauteous mystery
    Maloga's Holy Well.

Upon its velvet mossy brink
  Betimes I knelt in silent prayer,
Then from the goblet rose to drink
  The blessed waters sparkling there;
I watched its bubbles, rapture-bound—
  How sweet upon it then to dwell,
When dreamy stillness reigned around
    Maloga's Holy Well.

Still memory often pointing back
  To varied joys of vanished years,
With roses strews the exile's track—
  The exile's lonely spirit cheers;
Its wavering hand might cease to trace
  The changing tints of grove and dell,
But from it time can ne'er efface
    Maloga's Holy Well.

BULLS OTHER THAN IRISH.

"Bulls" are the peculiar property of no race or country, even though the Irish would claim them for their own. Herr Weizmann, chief of the reporting staff in the Austrian Reichsrath, has collected some brilliant remarks, of which the following are a few specimens:—

One most important point of the agricultural question is the maintenance of the breed of horses to which I have the honour to belong.

We are here for the weal and woe of our constituents.

Gentlemen, consider this question in the light of a dark future.

The eye of the law weighs heavily on our press legislation.

There, gentlemen, is the ever-changing point of which the opposition has made a hobby-horse.

This taunt is the same old sea-serpent which, for years and years, has been groaning in this assembly.

Ancient Boroughs of Ireland

(From Lewis's "Topographical Dictionary of Ireland," 1837.)

BALTINGLASS.

BALTINGLASS, an ancient borough, market, and post-town, and a parish, in the barony of Upper Talbotstown, county of Wicklow, and province of Leinster, 32 miles (W.S.W.) from Wicklow, and 28 miles (S.S.W.) from Dublin; containing, with the town of Stratford-on-Slaney, 4,110 inhabitants, of which number, 1,670 are in the town of Baltinglass. This place, according to most antiquaries, derives its name from "Baal-Tin-Glas," signifying, according to common acceptation, "the pure fire of Baal," and is thence supposed to have been one of the principal seats of druidical worship. At the time of the English invasion, it formed part of the inheritance of the Kings of Leinster; and about the year 1148, or 1151, Diarmit Mac Murchad O'Cavanagh, the reigning monarch, founded here a monastery for Cistercian monks, in the church of which he was afterwards interred. Among the most distinguished benefactors to this establishment, which became a mitred abbey, was John, Earl of Morton, afterwards King of England; and among its abbots was Albin O'Molloy, one of the most zealous advocates of the Irish clergy, in opposition to the overbearing allegations of Giraldus Cambrensis. The monastery was frequently plundered by the mountain septs of the O'Byrnes and the O'Tooles; and in 1314 the abbot obtained from the English government permission to hold a conference with the chiefs of those formidable septs, who in the deed for this purpose are designated "Irish Felons," in order to recover "the goods and chattels of which he had been robbed, or a full equivalent for the same." The monastery was suppressed in 1537, and with its extensive possessions, including the castle and manor of Baltinglass, was granted, in 1541, to Thomas Eustace, Lord Kilcullen, whom Hen. VIII. created Viscount Baltinglass. In the reign of Elizabeth a parliament was held here, in which was passed an act rendering every kind of inheritance forfeitable for high treason, emphatically called the statue of Baltinglass. James, the third Viscount Baltinglass, and his four brothers, having joined in the great Desmond insurrection, were convicted of high treason; and their estates being confiscated under this statute, were granted by Queen Elizabeth to Sir John Harrington. The manor is now the property of Henry Carroll, Esq., of Ballynure; and the castle, with the town and other considerable property in the neighbourhood, is in the possession of the Earl of Aldborough. During the disturbances of 1798, the insurgents, after their defeat in the county of Wexford, stationed themselves in the mountains of this neighbourhood, and continued for some time to commit outrages on the peaceable inhabitants of the surrounding country.

The town is pleasantly situated in a

romantic vale watered by the Slaney, over which is a stone bridge of three arches connecting those parts of it which are on the opposite banks of the river. It was incorporated by charter of Chas. II. in the 15th year of his reign (1663), under the designation of the "Sovereign, Burgesses, and Free Commons of the Borough of Baltinglass." The borough returned two members to the Irish parliament till the Union, when it was disfranchised, and the sum of £15,000 awarded as compensation was paid to the trustees of the Earl of Aldborough.

There are some considerable remains of the Cistercian abbey, chiefly consisting of a series of seven pointed arches springing from alternated round and square pillars with curiously carved capitals, which formerly separated the south aisle from the nave; the church appears to have been a spacious cruciform structure, and the west end, which is still standing, has the remains of a lancet-shaped window of three lights; the walls enclose a large area, which appears to have been surrounded with monastic buildings. Of the ancient castle, now converted into a farm-house, two Norman doorways leading into a court-yard are still remaining; and formerly many fragments of stone highly wrought lay scattered in all directions. Near the town is a cromlech, and numerous other relics of antiquity are said to have been lately existing there. On the eminence on which Golden Fort is built are two circular intrenchments or raths, surrounded by moats, in one of which the proprietor of the estate discovered, a few years since, a number of gold coins, from which circumstance the seat derived its name; and in the other, which is of larger dimensions and in a much more perfect state, was found a kistvaen containing an urn of rude pottery, in which were ashes, with a number of human bones scattered around: in the same demesne is an ancient cemetery. Baltinglass gives the title of Baron to the noble family of Stratford, Earls of Aldborough.

(To be continued.)

NOTES AND QUERIES.

MILESTONES.

(To the Editor of the "Dublin Penny Journal.")

Sir—If I am not mistaken, the milestones in the Co. Dublin on the road to Drogheda are inscribed G. P. O, and indicate Irish Miles, while those on the road to Howth are marked only P. O., and indicate statute or English miles. I have been told that the latter measurement is used on the Howth road because it is (as it were), a continuation of the great road from London to Holyhead. Both kinds of milestone are on the left side of the road going from Dublin.—C. T. McC.

PAPER MAKING IN IRELAND.

A practical and favourite way of aiding on the revival of Irish industries is the exclusive use of Irish-made paper; yet this, notwithstanding the number of paper mills at present in all Ireland, is less, I believe, than could be found in one county (such as the county Cork), about 60 years since, when the abolition of the duty on imported paper led to the failure of its home manufacture, and consequent closing of these mills. Is anything now known of the history of Irish paper making, or when it was first set up in Ireland?

—LECTOR

IRISH BIBLIOGRAPHY.

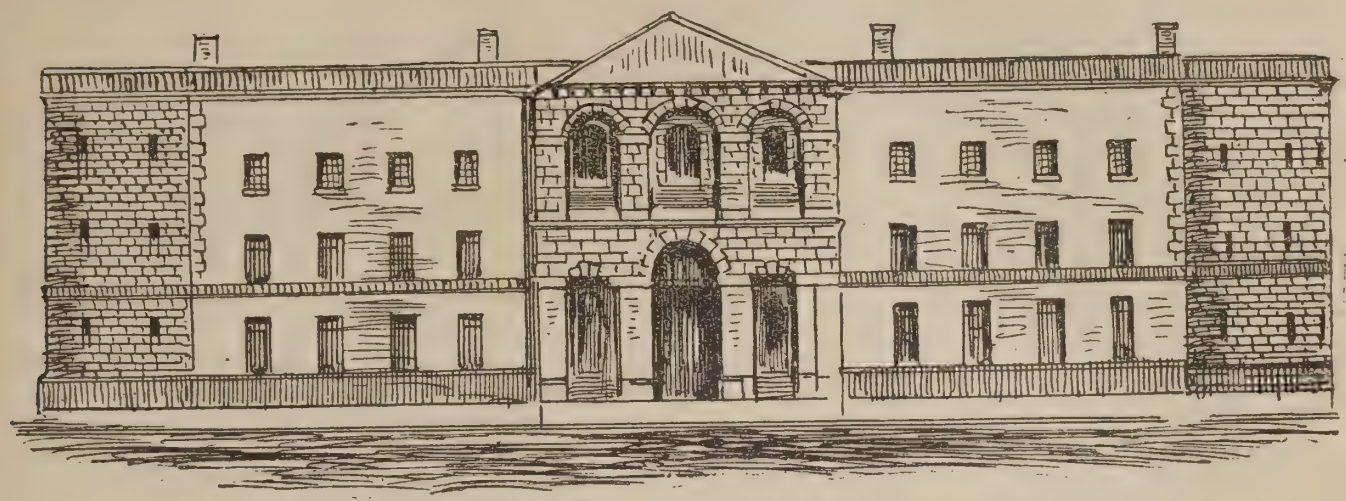
The Use and Need of Its Study

BY E. R. M'C. DIX.

(Read originally before the National Literary Society in February, 1900.)

In dealing with the subject of Irish Bibliography, I think it well at the outset to attempt some kind of definition of the term used, and in doing so I follow, to some extent, that indicated by the late Sir John Thomas Gilbert. Of course the derivation of the word is from two Greek words, one meaning "a book," and the other "to write," and, therefore, Bibliography means writing about books. Originally all books were written, and, therefore, the study of Bibliography comprises not only what we know now as books—that is, printed books, but also all forms of early books prior to the introduction of printing, now more generally known and described as manuscripts. Primarily, then, we must divide books into two classes—viz., (1) Printed, and (2) Written. Sub-divisions of these classes have then to be made, applicable more or less to each of these branches of the subject—that is, when one deals with the Bibliography of any particular country. In our own case, therefore, the subject of Bibliography should comprise (1) The works written or printed in Ireland, whatever the subject matter of the work may be, or whomsoever the author of it. (2) Works by natives of Ireland, whether written or printed at home or abroad. (3) Books about Ireland, its history, its literature, its people, etc., whether by natives or strangers, and wheresoever printed. Under each of these sub-divisions further sub-divisions arise, occasioned by the subject of the work. For example, books about music, history, poetry, any of the sciences, theology, law, etc., or books privately printed—that is, not published or offered for sale, such, for example, as family histories. Further details or sub-headings will also be found, with some differences as to printed matter and manuscript, so far as the mechanical portions of each work is concerned. In the case of manuscript, for example, the writing, the vellum, or paper, on which it is written; in printed books, the type and all things connected with the appearance of the book as printed, the paper, or vellum, on which it appears, its size, its binding, and other minutiæ, not necessary at present to refer to. Many manuscripts, too, are bound. Thus roughly, though sufficiently, I think, is shown that the term "Irish Bibliography" includes a great variety of points or matters of study and interest, suitable to various tastes and abilities.

Let us now consider the use of such a study. In the first place, it puts on record all that has been written or printed in connection with our own country, or by our countrymen, a fact of much importance. For example, many publications are ephemeral, or are thought to be so at the time of their publication, but after the lapse of centuries they acquire a fresh value. The pamphlet, the ballad, the proclamation, even the legal deed or instrument, may after the lapse of even one or two centuries become of great value in supplying some information as to the names of places or of people, of customs, of laws, of social questions, and the like, about which future historians, genealogists, and even novel writers, may eagerly seek information. Many manuscripts and many books have vanished completely, and all knowledge of them would be lacking were it not for the titles, and occasionally some very meagre particulars, being preserved in some catalogue, or perhaps in some contemporary or later work. The hand of time presses severely upon all writings and books. As illustrative of the use of preserving passing publications, I might mention that the earliest journals of a newspaper kind are now eagerly sought after, as they give glimpses of the life and manners of the times in which they were published, and often historical information that possibly could not be otherwise obtained. The daily paper that we toss aside so lightly, after skimming it at the breakfast table, may be eagerly sought for by the historian some two centuries hence, a solid reason for having all our newspapers filed and carefully preserved in our Public Libraries, or in some of them, at least.



This, however, is not the only use of Bibliography. The study of it also reveals the inception and progress of such arts and crafts as writing, illumination, printing, typefounding, wood-cutting, engraving, illustrating, paper-making, and bookbinding, and as these so largely enter into every relation of modern life, no country can afford to be ignorant of this really important study. The past enlightens the present, and is suggestive for the future.

Before proceeding further with the subject under some of its sub-headings, I would wish to point out what other countries are doing as regards their Bibliography. Let us take the case of the sister country; there the study, of books more particularly, has progressed for centuries. English Bibliography has drawn to its investigation continuously most ardent students, whose works, generation after generation, have enabled their successors to follow up this fascinating pursuit more deeply and widely. A library could be formed alone of books dealing with printing, bookbinding, typefounding, and all the other minutiæ of book forming. Each detail has its special students and authors. Nor is the subject by any means becoming exhausted, but rather is it becoming further developed, and a wider circle is being interested in the subject. There is one instance only I would refer to—that is, the series of books, six in number, published not long since by Kegan Paul and Co., London:—

1. "The Great Book Collectors," by Charles and Mary Elton.
2. "Book-Plates," by W. J. Hardy.
3. "Books in MS.," by F. Madan.
4. "Early Printed Books," by E. Gordon Duff.
5. "Early Illustrated Books," by A. W. Pollard.
6. Bookbinding," by H. P. Horne.

All these are books by experts each in his particular field, and a perusal of them is often useful to guide the Irish Bibliophile in what he should do or look for, and the lines on which this study must be pursued, for Bibliography is an exact science, with its own technical terms and its own forms pursued by its students in every country. There are Associations, too, for the study of Bibliography, all doing important work, both in England and Scotland, and on the Continent in particular, where printing had its origin, as far as Europe is concerned. If, then, the subject

NEWGATE PRISON.

THE HISTORIC OLD GREEN STREET EDIFICE (NOW DEMOLISHED).

The above is a picture of the now demolished Newgate Prison which stood in Green Street, Dublin. Historic interest attached to the old building, as in it most of the leaders of the United Irishmen were confined, and from the gallows which projected over the large iron gate in centre of the picture many of them were executed. The following account of the erection of the prison and of the manner in which it was once conducted is taken from the "New Picture of Dublin," published in 1821:—

The name Newgate was given to the old gaol of the city of Dublin, which stood in Corn-market, from its having been formerly one of the city gates. The former appellation continues attached to the present prison, the first stone of which was laid in the Little Green, on the north side of the city, in 1773. The site is considered to have been most injudiciously chosen, as there is not sufficient extent for the necessary yards and other accommodations; it is surrounded by wretched streets, and the ground is so low as to render the construction of sewers to carry off its filth impracticable. The building was erected under the direction of Mr. Thomas Cooley, at the expense of £16,000. It is a large quadrangular pile of three stories, extending 170 feet in front, and 127 in depth, having, at the external angles, four round towers. In the front are the guard-room, hospital, common-hall, long-room, chapel, &c.; and on the other sides of the quadrangle are the cells, which are universally 12 feet by 8, badly disposed and ventilated. The cells for the condemned are truly gloomy: they are nine in number, and compose the cellarage of the east front. There are two common halls to the prisoner's yard, where they are allowed liberty to walk.

Previous to the year 1808, the internal management of this prison was defective in the extreme, and abuses of a very flagrant nature are said to have existed. It was visited at that period by the Commissioners appointed for inspecting the Prisons of Ireland, who found the prisoners, tried and untried, and even some under sentence of death, indiscriminately mingled together, without any attempt at classification; and in some instances, from 8 to 14 were crowded together in one cell. Want of cleanliness and comfort was visible throughout the building, while the hospital was destitute of almost every essential necessary. Information was received by the Commissioners, that such was the anarchy and insubordination that prevailed amongst the prisoners from want of proper discipline, that robbery and other crimes of a more horrible nature were frequently committed within the prison, which were not only permitted but encouraged by the turnkeys.

---

is worthy of such attention in other lands, one may well ask what has been done on the subject here; or where should one look for all these details in the Bibliography of our own country. As regards MSS. I will, further on, make some reference to them; but without fear of contradiction I may say, that very little, indeed, has been done as regards our printed books. Sir James Ware's "Writers of Ireland," edited and very largely supplemented by Walter Harris (1746), is the earliest and best work in which Bibliographers can find much valuable information, and it must be the main source to depend on, apart from independent research, for books of the sixteenth, seventeenth, and beginning of the eighteenth centuries. It is not, however, a Bibliography but a record of Irish writers and others who resided in Ireland.

Similarly, Bishop Nicholson's "Irish Historical Library" is useful to a certain degree or extent, but less so a good deal than Harris or Ware. There are other writers of Irish Bibliography, such as Thomas D'Arcy McGee, Charles Read, etc., who refer to the works of those whose lives they relate, but as sources of Bibliographical information they are not of much use.

The next authority where one looks for information is Cotton's "Typographical Gazetteer," first and second series, in which some particulars are given of some of the earliest printing in several of our towns, but these form only a few items amongst a mass of information referring to the printing done in other countries and places. Power's "Irish Literary Enquirer" and "Handy Book about Books" are thoroughly valuable and useful so far as they go, but that is not very far. Power must have left a mass of MS. material, collected for many years, but where it is to be found I do not know. The only work solely, if one may so say, devoted to Irish publications of any importance or size, is the valuable work by the late Dr. R. R. Madden, on "Irish Periodical Literature." In this voluminous work, the painstaking and ardent author sought to record the various periodical publications of Ireland, its newspaper press, and its journals, from their first appearance throughout the country, and here and there in this work are references to other printing done here. The third volume promised never appeared, as the author's life was not spared long enough for its publication, but I have heard that the MS. materials for it passed into the hands of a private collector not long ago.

Scattered through some of the numbers of the old "Dublin Penny Journal," and other earlier, and later, magazines, as the "Irish Builder" for example, are occasional articles dealing with the subject of the earlier printing in Ireland, but they are hard to find, or not easily accessible; many of them are old, and all, in the nature of things, lacking information now available. For example, when Dr. Madden's book was written, there were not then in existence the "Calendars of Irish State Papers," in which so much information can now be gleaned. It is very greatly to be regretted, indeed, that the publication of these "State Papers" was suspended for many years—even now the recent volume just out extends only to 1632.

Of late years, however, it is pleasant to record that more attention has been paid to our Home Bibliography, and articles (more particularly in antiquarian journals) will be found containing information of much use and importance; but I would point out again that there is no book or publication dealing generally, or exclusively, with the whole subject of Irish Bibliography, or even one deal-

ing with any particular branch of the subject.

Not long preceding his death, the lamented Sir John Thomas Gilbert read two papers on the subject before the Royal Irish Academy, a body of which he was so distinguished an ornament. His principal life work as an author and compiler was of a much more important character—namely, that of editing many of our national or municipal records; but in such constant work and study he came frequently across particulars of books falling under some branch of the definition I have attempted of Irish Biliography, and the subject was one very near to his heart. His communications to the Academy, however, I regret to say, have not, up to the present, been published. The newspaper report of his first communication was exceedingly meagre. On the second occasion, however, much more attention was given to the matter, and a nearly full report is to be found in at least four of the Dublin daily papers of the time. Having obtained a copy of each report, and attempted to collate them, I only found some clerical errors which could be corrected without difficulty, so that at least a reprint of the newspaper report might still be made. These communications, valuable as they are, were no doubt only introductory to this important subject, but Sir John T. Gilbert was cut off in the midst of his vigour and work, and Ireland has suffered a great loss in the death of her eminent historian. Perhaps at some future date it may be possible for the Academy to publish amongst their transactions or proceedings the communications thus made to them by Sir John T. Gilbert, as any communication from his erudite pen would be of immense value, and have great weight with and interest for leading Bibliographers in other countries.

I must not, however, omit to mention another work of great value, which will be found of much assistance to Irish Bibliographers. I refer to Mr. D. J. O'Donoghue's "Poets of Ireland," in which the places of publication, editions, and sizes of the works enumerated are given, as well as the dates. A second edition of this unique and invaluable work is in course of preparation, I am very glad to know, and in it, I am sure, Mr. O'Donoghue will increase the Bibliographical worth of his work.

When one turns to the works of English Bibliographers for information as regards Irish printing, that information (if found at all) is, as a rule, of the most meagre character, and not seldom unreliable. It did not interest these English writers particularly. No doubt it seemed poor in their eyes and very late in date, but it ought to interest all of us very much. Amongst English Bibliographers, however, there was one to whom Irish Bibliography was a much-loved subject, though his published communications on the subject have been very brief and few. I refer to the late Henry Bradshaw, some time Librarian of University Library, Cambridge. His father was an Ulster man, which may, perhaps, account to some extent for his liking for Irish books and MSS. On the occasion of the visit of the Libraries Association many years ago to our city, Mr. Bradshaw gave an address on the subject of Irish printing and books, but, strange to say, save for a meagre report in the daily papers, his communication is not recorded, and the only explanation for this, so far as I can ascertain, is that, as quoted in his Memoirs, he so enthralled his hearers that they forgot everything, even to take notes of what he said! That he had a most extensive knowledge of the subject we have the strongest reason for believing. He left behind him, it is said, a large quantity of MSS. materials, but what has become of them, and in whose custody they now are, I do not definitely know, although I made some enquiries of Mr. Prothero, who wrote his Memoirs.

Of recent attempts to do something for Irish Bibliography, I would refer to the communication of Dr. F. C. Crossle as regards Newry printing, and those of Mr. James Coleman as regards Waterford, Kilkenny, and Limerick printing; of several other towns in the S.E. of the country; and also to occasional communications from Mr. J. Buckley, the late Mr. M. J. Hurley, Mr. C. J. Doran, and others. I must also more particularly refer to the list of early Belfast-printed books, compiled by Mr. John Anderson, formerly Librarian, and now Hon. Secretary, of the Linen Hall Library, Belfast. His list, indeed, was the first attempt of the kind, and was begun originally in a small way. Two enlarged editions of this list then appeared, with a later supplement, comprising the titles, printers' names, size, authors, etc., of all Belfast-printed books, from the earliest date of printing there down to 1830. Small as such a contribution to Irish Bibliography may seem to be, it is of great value as throwing light upon the literary and even social condition for a lengthened period of the place to which it relates. In Belfast printing did not begin, so far as is known, until 1694. The student of Belfast history will, I think, come speedily to the conclusion that the list of books published there bears testimony to the character of the town itself. It is much to be regretted that a similar list of Cork-printed books was not long ago published. It would have been of great interest and value. As a step in that direction, a list of Cork books is being compiled for the Cork Archæological Society's Journal, and is appearing in it by instalments. In this work I am greatly indebted to and assisted by Messrs. Coleman and Buckley. I have also begun, as perhaps you are aware, an attempt to follow in the footsteps of Mr. Anderson, as regards a portion of early Dublin printing, with the able assistance of my colleague, Mr. W. C. Dugan, but it is proving a far more laborious and expensive task than I at first anticipated, and one that can only progress very slowly, and as health and funds permit. As printing here began much earlier than in Belfast, so such a list, as I conceive, ought to be of much more interest and value, or, at least, will be so when it is completed. As we pass from one century to another, and the distance between us, and any point of our past history becomes greater, increased interest will attach to anything which throws light on that history or time. Too long have we neglected this study. There have been serious difficulties, no doubt, in the way in past years which prevented a proper development of such study, but if people's interest were now properly awakened in the subject no real difficulty would be found to exist at present. There is, in fact, I believe, a slowly awakening and increasing interest now being taken in the subject. Here, therefore, in our native bibliography there is a very wide field for numerous workers; in some cases an absolutely virgin field. I may mention, for example, the sub-class or division of bookbinding. There is, so far as I am aware, no work of any kind whatever dealing with Irish bookbinding. Lectures have occasionally been given on the subject, but they have not been recorded otherwise than in a passing manner in the daily Press. It is true that the unquestioned authenticity of native bookbinding of a handsome and valuable kind is not certain, while bindings on the Continent were early valued for their magificence; but a thorough search will, I have no doubt, obtain clear and definite information, and no opinion can really be expressed on the subject until this be done. There seems little doubt, however, that very handsome bindings were made here in the 18th century, but my own experience of the earlier Dublin binding, i.e., of that done in the seventeenth century, is exactly the reverse. It would seem to have been then of the very poorest description as far as ornamentation went, but very serviceable, all the same, were the plain leather bindings both for use and for the preservation of the books so bound. The binding of MSS. in Ireland, I think, has never been touched upon. It is certain, however, that handsome Irish bookbindings can be done at the present day if only people are willing to pay for them, but things handsome and valuable cannot be had cheap.

(To be Continued.)

THE BELLS OF LONDONDERRY.

BY JOHN KANE.

How sweetly rang the bells when we chased the honey bee,
And loudly sang the lark to you, love, and to me,
While winds of sunny April were whispering in glee;
Sing merry!
When childhood heard the bells of Londonderry.

How softly rang the bells when we clomb the misty hill,
When we reached the pebbled cradle of the foamy mountain rill,
And pledged our love at noontide when every bird was still;
Sing merry!
So clearly rang the bells of Londonderry.

And sprightly was the dancing beneath the flowered thorn,
When the little eastern moonlight, like plenty's golden horn,
Lit our way from stile to stile through the fields of whispering corn,
Sing merry!
So gaily rang the bells of Londonderry.

But now the mountain flowers have lost their rich perfume,
And the lark has now no rapture, the nodding rose no gloom,
Since they took you from the ocean to lay you in the tomb.
Never merry
Shall sound for me sweet bells of Londonderry.

But merrily they'll sound when my heart has passed away,
To the fisher near his nets, and the hillmen mowing hay,
To mothers at their doorsteps, and lovers in the May,
Making merry,
Still chime the silver bells of Londonderry.

DENIS KELLY, SPANISH OFFICER.

The Rev. Thomas C. Middleton, O.S.A., in the "Records of the American Historical Society," calls attention to a book relating to maps of the Philippines and notes the curious fact that several of the military drawings from the years 1770 to 1776 were done by a military engineer named D. Dionisio Kelly. "Nor yet, says Father Middleton, "much as we would welcome any further information of this descendant of Milesius, who years, too, before the independence of our own beloved colonies, was engaged in far-away Malaysia in rearing the defences of Manila, can aught else be learned than merely his name and profession—plain Denis Kelly, officer of the Spanish army."

NEW PHOTOGRAPHIC PROCESS.

A French military officer has just discovered a new photographic process, by which reproductions of a photograph may easily be had. It consists in laying the carte which one wishes to reproduce on sensitive paper, the printed surface of the one against the sensitive surface of the other. Exposure to the light in a frame is then made, followed by the usual operations for fixing. This gives a negative, with which one employs to renew the operations, and thus get a positive. This process enables the easy reproduction of a photograph to the exact size of the original, and gets rid of the dark room.

THE GAME OF COMAN.

AN OLD IRISH PASTIME
AS
PLAYED BY NORTH-AMERICAN INDIANS.

(From the "Dublin Penny Journal, 1832.)

Our readers will, we have no doubt, be highly amused in reading the subjoined picturesque account, abridged from Capt Basil Hall's Travels, of the Indian game of ball play, and which, they will be surprised to find, is in every respect similar to the favourite game of coman, as played in Ireland. We may naturally enquire, how has this curious coincidence originated? That it should be accidental is very improbable; and are we then to conclude that the Irish and the Creek Indians are descended from the same stock. Do not laugh, reader, at the folly of this supposition; it is not quite so ridiculous as you may suppose. You all know that our Phœnician origin has been asserted, and, we might add, proved by our historians and antiquaries; for our own parts, to a certain, extent, we have no doubt on this point. A similar origin has been also assigned to the North American Indians by the writer of the Universal History, and by a vast number of other learned men; and the probability of the conjecture has been wonderfully strengthened in our times, by the discovery of various remains of antiquity similar to those of the old world, and proving the occupation of the country at a more remote time by a civilised race. Let it be remembered, too, that those Indians are altogether unlike other savages, that they have the finest intellectual cababilities, and are brought without difficulty into the habits of civilised life. It is remarkable also that a singular coincidence is found in many of their simple primitive words with those of the Irish, as for instance, isca, water, Inis, an island, bogo, soft etc, coincidences that could hardly be the result of chance. How sublime, then, is the probable supposition that two branches of the same family, after journeying in directly opposite courses, and making a circuit of the globe, are again united into one community after a lapse of three thousand years!

We should not take leave of this curious subject without noticing that the game of coman, like that of chess, is proved historically to be of the highest antiquity in Ireland. In the will of Cahir Mor, monarch of Ireland, in the second century, preserved in the book of Lecan in the Library of the Royal Irish Academy, that monarch leaves to Crimthan fifty hurling balls of brass, and as many brazen coman.

Capt Basil Hall entered the country of the Creek Indians in the month of April, 1828. In his own peculiarly lively and amusing way, he describes various customs and ceremonies which he saw practised—but we have at present to do with nothing but the ball-play. Fifty strong, stout Indians from one village were pitted against fifty equally strong and nimble from another village—while men, women, and children were collected to witness the contest. After describing the preliminary ceremonies, the Captain says:—

At a signal from one of the chiefs the two parties suddenly sprung to their feet, and stood brandishing their sticks over their heads. Every player held one of these implements in each hand. They were formed of light, tough wood, I think willow, about two feet long, and as thick as my thumb. At the end farthest from the hand, the sticks were split and formed into an oval, three inches long by two wide, across which opening, or loop, were stretched two things made of hide. By means of these bats, the ball was struck to a great distance whenever any of the players succeeded in hitting it fairly. This, however, was not very often the case, for reasons which will be stated immediately. Generally speaking, the ball was grasped, or held between the end of the two sticks, and carried along over the head by the fortunate player who had got hold of it. The ball was pretty much like that used in tennis courts, only not so hard, being formed out of raw hide stuffed with deer's hair.

After the parties had stood for some minutes in silence, in two rows facing one another, they stepped forward till they came within the distance of a few feet. Upon some work of command being given by one of the chiefs, every one laid down his sticks before him on the ground. A deputation of the chiefs highest in rank now proceeded to examine and count the parties, in order to make sure of their being an equal number on both sides. All these ceremonies, and various others which I forget, being ended, an old man stood forward and made a speech, or talk, as it is called, which, being interpreted to us, appeared to be formed of injunctions to the combatants to observe fair play, and to do honour to their country upon this important occasion. As soon as he ceased, the Indians scattered themselves over the ground, according to some rules not unlike those of cricket, by which the players might intercept the ball, and send it back again in the right direction. I observed that each of the goals, or wickets, formed by the two boughs at the ends, was guarded by a couple of the most expert players, whose duty it was to prevent the ball passing through the opening—the especial object of their antagonists.

These long-protracted ceremonials and preparations being over, one of the chiefs, having advanced to the centre of the area, cast the ball high in the air. As it fell between twenty and thirty of the players rushed forward, and leaping several feet off the ground tried to strike it. The multiplicity of blows, acting in different directions, had the effect of bringing the ball to the ground, where a fine scramble took place, and a glorious clatter of sticks mingled with the cries of the savages. At length an Indian, more expert than the others, contrived to nip the ball between the ends of his sticks, and, having managed to fork it out, ran off with it like a deer, with his arms raised over his head, pursued by the whole party engaged in the first struggle. The fortunate youth was, of course, intercepted in his progress twenty different times by his antagonists, who shot like hawks across his flight from all parts of the field, to knock the prize out of his grasp, or to trip him up—in short, by any means to prevent his throwing it through the opening between the boughs at the end of the play-ground. Whenever this grand purpose of the game was accomplished, the successful party announced their right to count one by a fierce yell of triumph, which seemed to pierce the very depths of the wilderness. It was sometimes very amusing to see the way in which the Indian who had got hold of the ball contrived to elude his pursuers. It is not to be supposed he was allowed to proceed straight to the goal, or wicket, or even to get near it; but, on the contrary, he was obliged, in most cases, to make a circuit of many hundred yards amongst the trees with 30 or 40 swift-footed fellows stretching after or athwart him, with their fantastic tigers' tails streaming behind them; and he, in like manner, at full speed, holding his sticks as high over his head as possible, sometimes ducking to avoid a blow, or leaping to escape a trip, sometimes doubling like a hare, and sometimes tumbling at full length, or breaking his shins on a fallen tree, but seldom losing hold of his treasure without a severe struggle. It really seemed as if the possessor of the ball upon these occasions had a dozen pair of eyes, and was gifted at the time with double speed; for, in general, he had not only to evade the attacks of those who were close to him, but, to avoid being cut off, as it is called in nautical language, by the others farther ahead. These parts of the game were exciting in the highest degree, and it almost made the spectators breathless to look at them.

Sometimes the ball, when thrown up in the first instance by the chief, was reached and struck by one of the party before it fell to the ground. On these occasions, it was driven far amongst the pine-trees, quite out of sight to our eyes, but not to those of the Indians, who darted towards the spot, and drove it back again. In general, however, they contrived to catch the ball before it fell, and either to drive it back, or to grasp it and run along, as I have described, towards the end of the ground. Sometimes they were too eager to make much noise; but, whenever a successful blow was made, the people on the winning side utter a short yell, so harsh and wild, that it made my blood run cold every time I heard it, from being associated with tortures, human sacrifices, scalpings, and all the horrors of Indian warfare.

The notation of the game was most primitive. Two of the oldest and most trustworthy of the chiefs were seated on one side, each with ten small sticks in his hand, one of which was trust into the sand every time the ball happened to be driven through the wicket. Twenty was game; but I observed these learned sages never counted higher than ten, so that when it became necessary to mark eleven, the whole ten sticks were pulled out, and one of them replaced.

Sometimes the ball fell amongst the groups of lookers on, the women and children of the different Indian villages. It did not signify a straw, however, who was in the way; all respect of persons, age and sex was disregarded, in the furious rush of the players, whose faculties seemed concentrated in the game alone.

The agent had previously taught me the art of avoiding the mischief of these whirlwind rushes of the Indians; and it was fortunate for me that he did so. I was standing on one side of the ground, admiring a grand chase, which was going on at some considerable distance, when one of the players, who was watching his opportunity, intercepting the fugitive, and struck the ball out of the other's grasp, though he was bounding along with it at a prodigious rate. The ball pitched within a yard or two of the spot where I was standing. In the next instant a dozen or twenty Indians whizzed past me, as if they had been projected from canons. I sprung to the nearest tree, as I had been instructed, and putting my hands and legs round embraced it with all my might. A poor boy, however, close to me, had not time to imitate my example, and being overwhelmed by the multitude, was rolled over and over half a dozen times, in spite of his screams, which were lost in the clatter of sticks, and the yells and shouts of the combatants, who, by this time, had become animated by the exercise, and were letting out the secret of their savage nature very fast. I felt rather awkward, I must confess, as they rushed against me, and very nearly scraped me off; but I held fast, and escaped with a good daubing of rosin from the pine-tree. In half a minute afterwards the contest was raging some hundreds of yards off.

We did not stay to see the end of the game, as there was danger of our being benighted, an event which happened, however, notwithstanding all our precautions. I have since regretted much that I did not profit as far as I might have done by this only opportunity I ever had, or am ever likely to have, of seeing the habits of these people, who are fast vanishing from the face of the earth.

IMPERFECT SIGHT.

Savages and sailors are rarely near-sighted because they are incessantly looking at distant objects, seldom poring over books. Let a mother endeavour to make her child notice the shapes of distant objects, the flight of birds, the conditions of horses, their various actions, the growth and variety of trees. These apparently trifling cares are most useful in cultivating long sight, capacity for observation and accuracy in statements. To prevent short sight: First, prohibit a child from reading at dusk or by firelight. Second, never allow ill-printed books or one in small type. Third, no illuminant should be near the eyes, the heat being peculiarly injurious. Fourth, do not allow reading too long at a time. Fifth, a child should not stoop much over a book. Little beehive chairs are very useful in this way. The back is well supported and both feet can be placed straight on the ground. Bad positions in sitting are a fruitful cause of curvature of the spine. Sixth, at any sign of trouble in the eyes, have them at once examined by a competent oculist. Allow no amateur meddling on this important point.

THE HISTORY AND ANTIQUITIES OF THE CITY OF DUBLIN.

FROM THE EARLIEST ACCOUNTS:

Compiled from Authentick Memoirs, Offices of Record, Manufcript Collections, and other Unexceptionable Vouchers,

BY THE LATE WALTER HARRIS, ESQ.

CHAPTER X.

The history of the city of Dublin continued from the arrival of the English in 1169, to the settlement of it under that power in 1173.

HENRY II., king of England, from the beginning of his reign was animated with a strong ambition to reduce Ireland under his obedience, partly on account of the many injuries done to his subjects by piracies (Cox's Hist. Ireland, vol. I. p. 1), but principally as frequent aids were sent from thence against him in his wars with France (MS. College of Dublin). For this end he summoned a council of his great men at Winchester (Tyr. Hist. v. 2. lib. 5. p. 300) in 1155 to consult upon measures for carrying these his designs into execution; but the attempt was then looked upon to be so hazardous, that it was for the present laid aside, and he contented himself with procuring a bull (Pryn's Pap. Usurp. v. 1. p. 709) from Pope Adrian to licence his invasion of that kingdom upon a favourable opportunity, which in a few years after presented itself.

Dermod Mac-Murrough, alias Kevenagh, king of Leinster, a lustful and ambitious prince, having by arms obliged O'Neill, O'Melaghlin, O'Carroll, and other Irish princes to give him hostages, grew so insolent at his great successes, that he became oppressive (Geral. Cambr. lib. 1. cap. 1) to his subjects, and injurious to his neighbours, and more especially by a rape committed by him in the year 1167 on Dervorgille, wife of O'Roirk, king of Breffiny, who was daughter to O'Melaghlin, king of Meath; whereupon he was invaded by his enemies, and abandoned by his subjects and tributaries, particularly by Murrogh O'Birne (Maurice Regan), Asculph Mac-Torcall, king of Dublin, and Daniel, prince of Ossory, and after many defeats was obliged to forsake his country and throw himself at the feet of king Henry (then in Aquitian) and crave his protection and assistance, offering to become his liege-man, and to serve him faithfully during his life. The king of England, being engaged in his French wars, was disabled from affording him any present succour; but having taken from him an oath of allegiance, he by letters patent (Giral. Cambr. lib. I. cap. 1) granted a general licence to all his subjects to aid and assist king Dermod in the recovery of his kingdom. This happened in the year 1168.

With this encouragement king Dermod returned to England, and at Bristol published the king's letters, and his own overtures of great entertainment to such as would assist him. Richard de Clare, Earl of Strigul and Pembroke (commonly called Strongbow from his excellence in archery), was a man of great abilities and power (MS. College), of a high and conspicuous birth, magnanimous, but infinitely profuse, which had reduced his large estate to such a narrow condition, that having almost exhausted his patrimony, he was beyond measure obnoxious to his creditors, and from thence most ready to embrace all motions that promised any means of extricating himself from his difficulties. He was charmed with the proposals of the king of Leinster, and wanted nothing but king Henry's special licence (Regan MS.) to engage absolutely with him; which, if he could obtain, he stipulated to assist him in person, and with sufficient aids to restore him to his kingdom. On the other hand, the exiled king covenanted to give him his daughter Eva to wife, and with her the reversion of the kingdom of Leinster.

Fired with these hopes, king Dermod returned home, and wintered privately at Ferns among the clergy there (Giral. Cambr. lib. I. cap. 2). Yet, growing impatient at the delays in the execution of Earl Strongbow's engagement, on account of king Henry's special licence not yet obtained, early in the spring 1169 he despatched (Regan) his prime minister, Maurice Regan, called "his trusty servant and interpreter" (from whose history of these transactions, and from that of another contemporary witness, Giraldus Cambrensis, this account is chiefly gathered) into Wales, with authority in his name to promise to all who would serve him in his wars in Ireland, large recompenses in lands of inheritance, or good entertainment in money or cattle to such who should decline settling in the country. Robert Fitz-Stephen (a man of prime account in Wales, and who had been lately enlarged out of prison by king Rhees at Dermod's meditation) undertook the service, and under his banner lifted thirty gentlemen at arms, who were his own kinsmen, threescore men in Jacks or light coats of mail, and about three hundred archers and footmen. There also engaged in the same adventure, Maurice de Prendergast, with ten gentlemen at arms, and a good number of archers, and Maurice Fitz-Gerald, with ten gentlemen likewise at arms, thirty horsemen, and about one hundred archers. To these may be added Hervey of Mount-Maurice, Robert de Barry, Miler Fitz-Henry, and Miler Fitz-David, son to the Bishop of St. David's; but the numbers in their retinue are not mentioned.

This army, small indeed for so great an enterprise, landed (Regan) at Bannow-bay, not far from Wexford, in May, 1169; from whence they immediately despatched messengers to king Dermod, notifying their arrival, and were speedily joined by him, his natural son, Donald Kevanagh, and a good body of forces. With these they reduced Wexford, twice chastised the king of Ossory, plundered the country of O'Felan, brought O'Tool and others to submission, and obliged them to give hostages for their future loyalty. We only mention these actions briefly in order to connect them with the affairs of the city of Dublin, with which we shall now proceed.

King Dermod, animated with these successes, persuaded his new allies to turn their arms against Dublin, alleging that the reducing of that important place would lay a foundation for the conquest of the whole kingdom. But private revenge was the motive (Giral. Cambr. lib. I. cap. 22) to this undertaking, for the citizens had long before, under colour of friendship, invited Dermod's father to an entertainment, and getting him into their power, under pretence of some former injuries, basely murdered him, and contemptuously buried his body in a dunghill with a dog; from which time they cast off their allegiance to their prince, and continued in a state of rebellion under their own petty king, Asculph Mac-Torcall.

Leaving a small body of forces with Fitz-Stephen (who was employed in erecting a fort at Carrig (Regan. Tyrrel's Hist. Engl. vol. II. p. 346), two miles from Wexford, in order to bridle that fickle town, which was for the most part inhabited by Ostmen), king Dermod and his new allies put themselves upon their march to Dublin, and entering the borders of the territories thereof, they burned, spoiled, and wasted the same, and the whole country adjoining. The citizens finding their inability to resist, sued for peace, which they obtained upon swearing fealty, and giving sufficient hostages for their future obedience; which done, Asculph was continued in the government of the city.

This train of successes inspired king Dermod with higher undertakings, and he consulted with the English adventurers how he might recover the monarchy of Ireland, which some of his ancestors formerly enjoyed, and to which he pretended a title: and they advised him once more to solicit Earl Strongbow to make good his former engagements. He therefore wrote to the Earl (Giral. Cambr. lib. I. cap 12) and put him in mind that the year was already spent without seeing him. The earl, upon receipt of Dermod's letters, perceiving what feats the small body of English forces had achieved in Ireland, conceived great hopes of the undertaking, and determined to make the attempt; but first he hastened to the king, who was still in Normandy, and entreated him for licence to seek his fortune in

Ireland. The king, wearied with importunity, gave him such an answer as the earl interpreted to amount to a licence, and returning to Wales he despatched Raymond le Gross, with nine or ten knights and some foot (Cambrensis says seventy archers) to keep up Dermod's spirits till his arrival, which he promised should be without delay. Reymond landed near Waterford in spring, 1170, and having cast up a slight entrenchment, he had considerable success (Regan) against a strong party of the inhabitants of that city, supported by the prince of Ossory, Mac-Phelan of Offelan, and O'Ryan of Odrone, attended with an army of three or four thousand men. But he maintained his ground in his fortress of sods till Earl Strongbow landed in August following.

This noble adventurer brought with him two hundred men at arms, and a thousand others, as Cambrensis says; but Maurice Regan increases the number to fifteen or sixteen hundred soldiers. With these he immediately assaulted Waterford, and after two repulses made himself master of the town, not without a considerable slaughter of the citizens.

King Dermod and all the English adventurers joined Earl Strongbow at Waterford, where, according to compact, the marriage between the earl and Eva was solemnised.

In the meantime the citizens of Dublin (Regan. Giral. Cambr. lib. I. cap. 16) had again revolted, and it was determined in council to chastise them. While preparations were making for this purpose, Roderick O'Connor, king of Connaught, and monarch of Ireland, had raised an army of 30,000 horse and foot, with a resolution to impeach the intended enterprise against Dublin. In pursuance of which, he encamped with the main body of his forces at Clondalkin, three or four miles from Dublin, and guarded all the passes through the mountains with strong detachments. King Dermod laid the difficulties of the attempt before his confederates; but they judged that to draw back would give such a reputation to the arms of the king of Ireland as would be little short of a foil, and therefore it was resolved in council to proceed. Miles de Cogan, an officer of great valour, marched in the van with a regiment of 700 men, supported by Donald Kavenagh, natural son to king Dermod, and a strong body of Irish. Reymond le Gross led the battle with a regiment of 800 English, supported by king Dermod and 1,000 Irish. The rere was brought up by 3,000 English, headed by Earl Strongbow, and supported by a strong regiment of Irish. Their orderly march so appalled the enemy, that they gave way without making any opposition, and the king of Ireland, by advice of his council, dissolved his army and returned home. This is the account given by Maurice Regan (who was then in the army, and on the score of his prudence sent from thence to summon Dublin), which we choose to follow, rather than the relation of Cambrensis, who says that the confederates gave the Irish army the slip, marched through the mountains of Glandelogh, and got safe to Dublin. This would be to expose themselves between two armies, or (as it is now called) between two fires, which the English were better experienced soldiers than to run the hazard of.

Maurice Regan was despatched to summon the town, and to demand thirty hostages for the better assurance of king Dermod. Asculph Mac-Torcall, fearing the issue of a siege (Regan), was ready to submit to the terms; but the citizens disagreeing in the choice of the hostages, the time allotted for the treaty expired, of which Miles de Cogan took advantage, and, without any command from king Dermod or the earl, made himself master of the town with great slaughter. The soldiers got good spoil from the rich townsmen, and Asculph and many of the Ostmen citizens escaped by means of their shipping in the harbour. The same day (being the 21st of September, 1170) king Dermod and the earl made their entry into Dublin, wherein they found great abundance of provisions. A few days after Dermod returned to Ferns, and the earl, about Michaelmas, marched to Waterford with a part of his forces, leaving Dublin under the command of Miles de Cogan, who may truly be called the first English governor of it.

King Dermod died (Regan ibid. Giral. Cambr. lib. I. cap. 20) at Ferns in May, 1171, and most of the Irish nobility forsook the earl, except Donald Kavenagh and two or three others.

In the meantime, the news of these fortunate successes had reached the ears of king Henry (MS. College), who was jealous of Strongbow, and thought himself robbed of the glory of so great a conquest. He, therefore, not only confiscated all the earl's estate both in England and Wales, but by proclamation (Giral. Cambr. lib. I. p. 19) prohibited all his subjects from importing provisions or stores into Ireland, and further commanded such of them as were already in that kingdom to return home by a certain day. This proclamation, and the news that O'Connor, king of Ireland, had levied an army with an intent to besiege Dublin, brought the earl back both to defend the town and to consult of means to appease the king's anger. O'Connor invested the city with an army of 60,000 men. He himself took up his post at Castleknock and Finglas, Mac-Dunleve, king of Ulster, encamped at Clontarf, O'Bryen, king of Munster, at Kilmainham, and Moriertach, prince of Kinsellagh, at Dalky, waiting for the arrival of Asculph, who was expected with a fleet and a considerable number of forces from the isle of Man, and the Orcades; by which means all access to the city would be shut up. But he came too late.

Dublin being thus invested with a numerous army, and within but weakly provided with men or victuals for a defence, the stores taken with the city being much consumed, nevertheless bore the siege for two months. But then, all necessaries failing, earl Strongbow called a council, and laying before them the scantiness of their provisions, and the little hopes of relief from abroad, especially as king Henry had prohibited his subjects from sending them any aid, he advised to send to king Roderick, and propose a treaty, and that he should offer to submit himself unto him, become his man, and hold Leinster of him as a feudatory province. This council was approved, and Laurence, archbishop of Dublin, was commissioned to treat with Roderick. But he, knowing the difficulties the garrison laboured under, and not doubting but he should carry the town by assault, insisted upon much more exorbitant terms, and therefore willed the archbishop to tell the besieged that unless the earl would surrender up into his hands the city of Dublin, and also Waterford and Wexford, together with all his castles, and at a day prefixed abandon Ireland and return home with his English forces, that he would without delay give the assault, and made no doubt of carrying the city by storm.

(To be continued.)

THE CAUSES OF BAD SPELLING.

The following analysis of the causes of bad spelling is the outcome of deep study by an American Professor:—

Let me say that, in a long struggle against bad spelling by college students and others, we have never made use of a "spelling book." I do not believe that such a book should ever be used above, say, the fourth grammar grade. I am fully convinced that at least 90 per cent. of our prevalent bad spelling comes from an unwise use of the "visual" method. It has been demonstrated by recent experiments in our psychological laboratory that on an average a person does not see at one glance more than four consecutive letters of any word. The prevalent idea of taking a long word at a single gulp, so to speak, is therefore psychologically unsound. In our effort to improve the spelling of candidates for admission to our English courses we have found three or four methods effective.

(1) A careful drill in etymology, showing the obvious relation of Latin declensions and conjugation to the spelling of a vast number of common words. Such a drill generally helps the student to avoid misspelling such words as "arable," "divisible," "movable," and hundreds of other words where a slight recollection of the declension or conjugation involved will save the speller from blundering.

(2) A careful drill in the application of the half-dozen well-established rules for doubling letters, eliding the final, etc. It is amazing how generally grammar school and high school teachers ignore these rules. Yet these rules are as free from exceptions as the ordinary rules of Latin syntax.

(3) The determination of the besetting orthographical sins of each individual pupil. Except in the case of a very few incorrigibly bad spellers—and the number of these is infinitesimal, comparatively—it is found that persons habitually misspell each a few common words. It is for the earnest teacher to determine patiently, in each individual case, what these besetting orthographical sins are, and to drill the pupil accordingly. Such words can easily be determined by means of dictation exercises. If the drill in etymology and in spelling rules does not remedy the case, it is not difficult to suggest some fantastic association, by means of which—applying the well-known psychological law of remembering by association—the pupil may forever avoid his tendency to blunder on a particular word. For example, who need again misspell the often misspelled word "separate" after he has been reminded that that word is always "at par"—that is, contains the sequence p-a-r

(4) A thorough and continuous drill in syllabication. The neglect of syllabication in our grammar and high schools is amazing. As I have already said, this is the root of the matter. The "visual" method is of the very greatest value in teaching a young pupil to read, but it is, I repeat, responsible for most of our bad spelling, in so far as it is used to the exclusion of the analytic method.

LITERARY NOTES.

The Bible on which the King will take the oath at the Coronation is to be beautifully bound in red polished levant morocco. Both covers will have a Tudor rose border. On the front cover there will be a cottage roof centre design, and on the back one the arms of Edward the Confessor, Oxford University, Cambridge University, and Westminster Abbey. There will be no clasp or metal corners on the Bible, but the edges will be solid gilt. The Bible used at the Coronation of Queen Victoria was also an Oxford Bible. It is now in the possession of the descendants of the then Bishop of Winchester, Dr. Sumner, who was entitled to the volume by virtue of his office as Prelate of the Garter. Queen Victoria inscribed her name on the fly-leaf.

✧ ✧ ✧

Mrs. Humphrey Ward, the writer of at least half a dozen books, each of which would have rendered her famous, was born at Hobart, Tasmania, on June 11, 1851. She is grand-daughter of Dr. Arnold, the great Head Master of Rugby, and a niece of the late Matthew Arnold. She began work by writing many magazine articles and a series of essays on Spanish subjects for the "Dictionary of Christian Biography." Her first book, which was published in 1881, is "Milly and Olly," a child's story, illustrated by Mrs. Alma Tadema. "Miss Bretherton" appeared in 1884, and in 1888 the world was taken by storm with "Robert Elsmere." Seven editions of the three-volume form and over 90,000 copies of the one-volume edition have been sold in this country. In America, chiefly owing to the enterprise of the "pirates," half a million copies were quickly sold.

✧ ✧ ✧

"Robert Elsmere" was but the beginning. It had scarcely been translated into three languages, when "David Grieve" appeared in 1892, to be soon followed by "Marcella," "Sir George Tressady," "Helbeck of Bannisdale," and "Eleanor." In 1890 Mrs. Ward took the leading part in the founding of University Hall, an institute for the use of the poor of South St. Pancras. This has now become the Passmore Edwards Settlement, of which Mrs. Humphry Ward is Honorary Secretary.

✧ ✧ ✧

Mr. Donald Ferguson writes as follows to the "Daily News":—"Mr. Quiller-Couch is quite right with regard to the meaning of 'send' in the line, 'Send him victorious,' from the National Anthem. The Century Dictionary, under the verb 'send,' has: 'To cause to be; grant. (Obs. or archaic). As examples of the use of the word with this meaning it quotes:

'God send him well!'—Shaks., "All's Well," i., 1, 190.

'Send her victorious,
Happy and glorious.'
—H. Carey, "God Save the Queen."

'God keep you all, gentlemen; and send you meet, this day, with another Bitch-otter.—I. Walton, "Compleat Angler," p. 61.'"

✧ ✧ ✧

Mr. W. M. Voynich is one of the most eager of living bibliophiles; moreover, his eagerness is ever directed by a scholarly devotion to truth. The several Voynich catalogues issued during the past few years serve as object-lessons in their kind. Epithets such as rare, scarce—to say nothing of unique, a word which Mr. Voynich does not include in his vocabulary—are never over-exploited; references to the works of well and lesser known bibliographers, to copies of books in greater and smaller libraries, are the result of knowledge, indefatigable labour. There opened last week, at No. 1 Soho square, an exhibition of some 150 books and examples of incunabula, not one of which is to be found in any of the great libraries of Europe, from Italy in the south to Sweden in the north, from England to Russia or Poland. Mr Voynich is a traveller, and has made personal research in practically all the important public collections. The catalogue, in the compilation of which much aid has been given by officials of the British Museum, represents a labour difficult to realise, save by the initiated.

✧ ✧ ✧

It is impracticable in a brief note to give an idea even of the most attractive items. One great source of "finds" has been the bindings of old books. Actually protecting a work printed in Geneva—the plain vellum alone visible on the outside—is the fourth part of a map, almost without question sketched by or for a member of the Magellan expedition, whose crew, without the famous Portuguese navigator himself, reached Spain on September 6th, 1522, after having made the first voyage round the world. The course of the Victory is indicated on this map, and many of the place-names appear in red. In the right-hand corner is an interesting Latin inscription. Needless to say, Mr. Voynich hopes some day to find one or more of the remaining quarters. Another "binding find" is a summary of the Bull issued by Leo X. in 1514, to confirm that of 1512, showing the marks by which it was affixed to the doors of the church, with the Papal arms, St. Peter's keys, etc., hand-painted on a separate piece of paper. Similarly, we see a Hebrew alphabet, printed in Poland during the 17th century, with in the centre a well-known wood-cut. Some Petrarch enthusiast caused to be printed, probably at a private press, about 1600, on palimpsest vellum, a eulogy of the poet, excerpted from several sources; and here we have probably the only copy so executed for the possessor's own use. An interesting "Guide to Rome," printed there in 1562, by an Englishman named Shakerley; three dictionaries, each in six languages, Venice and Nuremburg, between 1536 and 1548, and all earlier than those in the British Museum; a "Life of S. Clare of Montefalco," Milan, 1504, with a most unusual wood-cut; a fragment of the second book printed in London, 1481, this by John Lettou, the Lithuanian, about whom so little is known; a psalter, printed at Venice about 1527, the type exquisitely spaced and put on the page; a portrait of Queen Elizabeth, impressed on a contemporary binding, varying somewhat from the portrait in the Bible of 1573 or 1583; and a perfect example of one of those strange presentments of the main divisions of the interior of the human body, dating from 1559; these are one or two, only, of the books, etc., of signal interest in the exhibition. Students and bibliophiles should not fail to visit the collection during the next few weeks.

✧ ✧ ✧

"What are Keats?" asked a frank Philistine, as he listened to a discussion on poetry. In similar spirit a correspondent who has found the Dumfries Burns's Club preparing to celebrate the centenary of Thomas Aird, asks, "Who was Aird?" Few beyond the Scottish border know of him. But he was born on August 28, 1802, and at Edinburgh University he met Carlyle, with whom he kept up a life-long friendship. Aird spent most of his life editing newspapers; but he found time to write a good deal of verse. His "Captive of Fez" appeared in 1830. One of the most popular of his books was the "Old Bachelor in the Scottish Village," which Scotland still remembers. Hogg, Christopher North, de Quincey, Lockhart, were among Aird's friends, and perhaps he is more notable for these than for anything else.

✧ ✧ ✧

In a few months time there will come round the centenary of the establishment of the newspaper press in Australia. The original paper—the "Sydney Gazette and New South Wales Advertiser"—died suddenly in 1843, after a vigorous and stormy life of over forty years. It was founded by Mr. George Howe, a West Indian creole, who had spent some time as a compositor in the office of the "London Times," and ventured out to Port Jackson in the very early day of that settlement. Curiously enough, the drama arrived before the Press in Australia, for it was in 1796 that the "Broad Arrow Number One" company produced "The Revenge," for which the notorious pickpocket, Barrington, wrote the famous prologue:—

From distant lands, o'er widespread seas we come,
Though not with much éclat, nor beat of drum;
True patriots we, for be it understood,
We left our country for our country's good;
And none will doubt but that our emigration
Has proved a blessing to the British nation.

✧ ✧ ✧

Mr. Charles Hughes has made an interesting literary discovery, which a prospectus lately received from Messrs. Sherratt and Hughes tells us that he intends to publish in the autumn. This is a hitherto unpublished fourth part of the "Itinerary" which Fynes Moryson printed in 1617, "containing his Ten Yeeres Travell through Germany, Bohmerland, Switzerland, Netherland, Denmark, Poland, Italy, Turkey, France, England, Scotland, and Ireland." At the end of this quaint and entertaining work—which has long been a mine for writers on the social conditions of Europe towards the beginning of the seventeenth century—Moryson gives a list of chapters which he proposed to add to his work, in which he intended to describe the social and political customs of various States more exactly than he had been able to do in the body of the narrative. Mr. Hughes was fortunate enough to discover this continuation, practically ready for the press, in the library of Corpus Christi College, Oxford. He has obtained permission to copy and publish the work, which will appear in the autumn—perhaps the first time on record that the fourth part of a work has appeared nearly three centuries after its predecessors went to press. Of the discovery Dr. Ward writes:—

The MS. is beyond all question worth publishing as a singularly faithful account of the manners and customs of German life, especially in cities and universities—founded not on hearsay but on close and accurate observation. The writer was one of those men who have a passion for detail, but his clearness of insight is as marked as his directness of style. It is certainly a very good find."

✧ ✧ ✧

Mr. Thomas J. Wise possesses probably the most exhaustive Shelley collection of any book-lover—but not, if we mistake not, a copy of one rarity. Doubtless he is among those who have detected a singular error which appears in the catalogue of a library about to be sold in King street. Shelley's first publication was "Zastrozzi," recently valued at £150, as against a published price in 1810 of 5s. Next came "Original Poetry by Victor and Cazire," no example of which seems to exist. In the same year, 1810, there was printed at Oxford, by J. Munday, "The Posthumous Fragments of Margaret Nicholson; being poems found among the papers of that noted female . . . edited by John Fitzvictor." Shelley was responsible for most, if not all, the verses—mere rhodomontade for the most part—professedly written by the maniac washerwoman who attempted the life of George III. The 4to., of some 29 pp., is extremely scarce, but about twenty years ago a reprint, sometimes mistaken for the original, was published by Mr. Sheppard. In the Christie catalogue the book appears under the name of Margaret Nicholson, Shelley going unmentioned. In the unlikely event of this proving to be a copy of the editio princeps, a high price is certain. If its money-worth has increased during the past decade in proportion, for instance, to that of "Adonais," each printed page may fetch more than £3. The last "Margaret Nicholson" sold at auction, in the Gardyne library about 20 years ago, made £52, and is now at Rowfant.

SCIENTIFIC TOPICS.

Several remarkable instances are known in which the Yankee boy's trick of whittling led to valuable inventions. According to a writer in the "Stationary Engineer and Machinist," the elder Cunard, who was apprenticed as a lad to a Scotch shipbuilder, is said to have amused himself in whittling the hulls of vessels. Occasionally he would fit one of these with masts, sails, and rigging complete. Tired of familiar types, he would experiment with new ships, and one of these it was that attracted the attention of his master, because it would not maintain its upright position in the water. Experiments were made to ballast it, in order to give it the proper trim. The clipper-like shape and graceful, long lines of the model promised great speed. Such is said to be the origin of the standard model of the Cunard and later ocean greyhounds.

✧ ✧ ✧

Robert Livingston Stevens had grown to man's estate when he sailed from New York to Liverpool, eighty years ago. But he had not outgrown his love of whittling. In those days the passage took two months, and Stephens passed many an hour, jack-knife in one hand and a piece of wood in the other, brooding over a problem that had often worried him—how to run a railroad without stone stringers for tracks. He wanted to get an iron rail that would "hold," and would take the place of the thin strips fastened to the chair of the roadbed. Just before he reached England, his whittling revealed to him the solution of his problem, and that solution took the form of a T-rail with a broad base that could be applied direct to a solid wooden support. That T-rail is still in use on all railways of the world.

✧ ✧ ✧

A simple instrument has been tried experimentally on the Government Telephone Exchange in Stockholm for about a year, to indicate to the subscriber whether the operator is listening to the conversation. Bridged across the subscriber's line and connected to it by a double pole switch is a current detecter whose middle point is earthed. The centre point of the operator's receiver at the exchange is earthed through the "engaged-test battery" in the ordinary manner. Thus, when the operator switches in her telephone through her listening key, a current is sent over both lines in parallel, through the above-mentioned subscriber's indicator, and to earth, and the subscriber knows that the telephone operator is on the line. The indicator itself has two astatic needles, on whose common axis an aluminium disk is placed with red, black, and white crosses painted upon it. This disk moves behind a black painted shutter. When any current is passing through the indicator the black cross is behind a cut of corresponding shape in the shutter, and when the operator is listening the red or white cross shows. In this way, when the communication is through two exchanges, the connections can be so arranged that the white cross indicates that the operator at one exchange is listening, and the red cross that the operator at the other exchange is in circuit. This instrument is said to have worked well on the Stockholm system and to have been popular among subscribers.

✧ ✧ ✧

A departure which may turn out to be of some importance to the automobile industry, is described in a paper read by Dr. N. Caro, of Berlin, before the German Ecetylene Verein at a meeting held at Eisenach. It appears from Dr. Caro's contribution that acetylene gas, when led through petrol, becomes heavily carburetted by it in much the same way as does ordinary atmospheric air. One hundred litres of acetylene will in this way take up 125 grains of petrol, yielding 150 litres of carburetted gas. As a heating agent the carburetted acetylene is superior to ordinary acetylene in the proportion of about 6 to 4. It is plain that we have here a gaseous mixture containing a high degree of energy. Should it turn out to be applicable to explosion engines it ought to enable motors of extreme power per unit of weight to be constructed. There may, of course, be practical difficulties in the way, and they have not altogether been satisfactorily got over yet in the case of acetylene gas alone, while the fact that there is a tendency for petrol vapour to separate out from the acetylene on cooling somewhat, may give rise to additional complication, but in any case the discovery is one of high importance.

✧ ✧ ✧

Mr. E. G. Clayton, of London, has been engaged for some time past examining and analyzing the incrustation upon the exterior masonry of the stone gallery of St. Paul's Cathedral. This stone during the two centuries it has been standing has become very weather-worn, and the grey incrustation with which it is covered is as much as ¾ inch in thickness at places. The composition of this substance analysis reveals to be as follows—Water loss at 100 deg, 2.06; water loss at 150 deg, 22.48; carbon (soot), 1.10; calcium sulphate, 59.38; calcium phosphate, 2.22; calcium silicate, 1.63; magnesium silicate, 0.67; iron silicate, 2.40; sand and uncombined silica, 8.06. The substance is stalagmite in character, chiefly composed of calcium sulphate, hydrated together with some silicious matter. It is probable that the rain and the sulphurous and sulphuric fumes exhaled by the surrounding chimneys combined with the rain are responsible for the calcium sulphate deposit.

✧ ✧ ✧

The United States Mint gives in exchange gold coin for gold bullion, no charge being made for the coinage of the bullion; but a charge is made for the copper added in making an alloy of the proper standard, or 900 fine, that being the fineness of both gold and silver coin (says the "Mining and Scientific Press"). All unrefined gold bullion, unless it be foreign coin, must be refined or parted, for which a charge is made in accordance with the fineness of the metal. Upon fine gold—that is, bullion over 900 fine in gold—no parting or refining charge is made. Seigniorage is the actual difference between the face value of the coin and the market price of the metal in the coin. As the market price of the gold in a gold coin equals its face value, there is no seigniorage upon the coinage of gold. In all United States silver coins it is different. In the silver dollar, containing 412½ grains of metal. 371¼ grains of which is pure silver, if the market price of an ounce (480 grains) of silver is 60 cents, and the Government puts in the dollar 371¼ grains of silver, then the difference between the market value of 371¼ grains of silver and the amount of silver which the dollar will purchase is the seigniorage.

✧ ✧ ✧

For some time past the experimental staff of the British Naval Torpedo School at Portsmouth have been endeavouring to devise some means to frustrate the attack of a submarine upon a battleship. A contrivance had been designed for this purpose, consisting of an outrigger torpedo fired from a pole projecting from the side of a torpedo boat destroyer. A torpedo fired in this manner resulted in a sufficient shock to disable a submarine vessel within a radius of thirty feet. The drawbacks to the scheme, however, were that the pole was shivered into fragments whilst the torpedo boat destroyer itself also sustained a severe shock. Although various other contrivances have been tried, the outrigger torpedo and pole have proved the most feasible means for fighting the submarine. The experimental staff has now devised a new and stronger pole, which withstands the shock of the torpedo when detonated, but at the same time allows it to be fired with full effect. A series of trials with the apparatus has been carried out at Portsmouth in connection with a torpedo destroyer, and no ill effects were experienced upon the vessel during the discharge of the torpedo. So satisfied is the Admiralty with the apparatus, that it is to be generally adopted in the British navy.

✧ ✧ ✧

In a recent number of "Science" a method of utilising fluorine from fertilising plants is described. When natural phosphates are decomposed by sulphuric acid in the manufacture of superphosphate fertilisers, there is much hydroflouric acid set free as such or as fluoride of silicon. This is especially the case when apatite (native phosphate of lime) is used; indeed, this fact detracts very materially from the value of the immense apatite deposits of Canada. In Germany manufacturers are compelled by law to prevent the escape of these deleterious gases into the atmosphere, and efforts are being made to utilise the waste product. By leading the gases through water, fluosilicic acid is formed, and from this solution sodium fluosilicate or magnesium and aluminium fluosilicates may be readily prepared. The last two have some use in hardening calcareous stone. More recently it has been discovered that fluosilicic acid has strong antiseptic properties, and that as a preservative of manure it surpasses plaster, kainite, or super-phosphate of lime. The denitrifying action of bacteria is checked, preventing the loss of nitrogen. The aqueous acid in bottles would hardly be acceptable to the former, and no satisfactory absorbent of the acid has been found. A patent for a new manure preservative has recently been taken out, in which the fluosilicic acid is incorporated with clay, with the bases of which it for the most part combines. With this powder goes another consisting of a porous substance saturated with sulphuric acid. A small quantity of each powder is scattered over the manure pile, and by the action of the sulphuric acid on the fluosilicates fluosilicic acid is generated, which acts as an antiseptic.

✧ ✧ ✧

The American Museum of Natural History has just acquired a unique wonder of marine life in the shape of a gigantic Japenese crab, measuring 12 feet. This is the largest specimen in the world, the Biological Department of Columbia University having the next in size. The specimen shown is a type of the spider crab, which inhabits the waters of the group of islands forming the Empire of Japan. At four of these great islands, at present, according to Prof. David Starr Jordan, some 1,100 different marine species are known to exist. The extraordinary size of the crab is strikingly shown in comparison with the ordinary-sized one; the body portion is of about the size of a large dinner-plate, while its two great arms, containing saw-like teeth, called "pinchers," could encircle the outstretched figure of a man. The eight arms resemble sections of bamboo growth, and are extremely elastic. One of the peculiar features of the crab is its faculty of assuming a disguise. This feat they are able to perform owing to the flexibility of their pinchers, and to the hooked hairs and spines with which their numerous arms are studded. By means of these pinchers they tear off small fragments of sponges and seaweeds. After first putting these to their mouths, which contain a glutinous saliva, they place them on the surface of their limbs and body, by sticking them fast with a rubbing movement. By this method the crab succeeds in completely changing its appearance and rendering itself indistinguishable from the materials common to the bottom of the sea. The big crab is one of the features which Prof. H. C. Bumpus, Curator of the Department of Invertebrate Zoology, is arranging for exhibition.

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1793.)

MARCH 14.

Accounts were said to have been received yesterday at the Castle, of a dangerous rising of the lower orders of the people a few days ago, near Kinsale, in the county of Cork. The magistrates and a party of the Carlow Militia quartered there, attended for the purpose of dispersing them, but notwithstanding the Riot Act had been read, and that orders and entreaties for their immediate dispersion had been employed on the part of the magistrates, the rioters continued obstinate, and orders being given to fire, four of the deluded wretches were killed on the spot, and several othere wounded and taken prisoners.

A letter, dated Cork, March 10, received by Messrs. Doyle and Roe, of this city, mentions that a vessel bound from Lisbon to Bristol, had arrived there that day, under the protection of the Hermit privateer. The vessel had been taken by one of nine French frigates cruising between latitudes 42 and 47, and about longitude 14, but happily rescued by the Hermit. One of the French frigates is said to carry 40 guns. The letter adds, that it is supposed this squadron of frigates are lying in wait for the West India fleet now there.

Last week several vessels sailed from the great victualling ports of Cork, Waterford, and Dungaryan, with provisions of all kinds for Leghorn, where large store-houses are taken by the British Consul, in which they will be deposited for the use of Lord Hood's squadron while it remains in the Mediterranean.

A gentleman just arrived in town from the county of Tipperary, says, that, in passing last Sunday over the great plain near Durrow, there happened a most dreadful thunder storm, which continued sixteen minutes, and ended with a crash in the atmosphere loud enough to be heard many miles round, The clouds then discharged a shower of hailstones as large as middling gooseberries, one of which struck him in the eye, which is not yet recovered.

Diligent search is making by the police inspectors after a junto of coiners, said to be at work in some obscure part of this city, from whence they issue and find means to pass counterfeit half-crowns, shillings, and sixpenses, throughout town and country. Two or three ragged boys, remarkable for wearing no shoes, stockings, nor hats, who daily purchase bad shillings for a halfpenny or penny each, may be well suspected for agents to the company, who by washing them with a quantity of litharge and quick-silver, can so clear their complexion, as to impose on hasty or ignorant people with the greatest ease.

Yesterday a proclamation of the Commissioners of Police, for regulating the rates of all sorts of carriages, whether for pleasure or for the conveyance of merchandise, plying within the precincts of the city of Dublin, was posted up in several of the most conspicuous places in the city—a regulation which the extortion of coachmen, carmen, and others employed in the carriage of goods, rendered highly necessary.

CORK, MARCH 6.

We are concerned to hear from different quarters of attempts to disturb the public peace by illegal assemblies, tendering and taking unlawful oaths. The spirited and timely exertions of the civil power, and the very active and zealous support of our garrison (a part of the 14th Dragoons and the Tipperary Militia), has secured and brought to justice a number of these deluded wretches.

This turbulence only exists amongst a low class of farmers and cottagers, who have for these two seasons got double the former prices for every article of country product brought to market.

On Monday eleven of these deluded people were taken out of a large body in the South Liberties by Sheriff Evanson, and a party of cavalry, and Tipperary Militia, and committed to Bridewell; and yesterday the Rev. Mr. Delany, and Mr. Johnson, High Constable, with a like party, surrounded 185 of them on the borders of the North Liberties, who are lodged in the county gaol.

Yesterday the Carlow Militia, a fine body of men, marched in here, and this morning set off for Kinsale, where they are to do duty. To-morrow the 33rd Regiment, 1,000 strong, and the city of Limerick Militia, will come in.

TRIM, MARCH 13.

The trial of Mullen, for the murder of the Rev. Mr. Butler, came on yesterday. The first evidence was the surgeon who attended the deceased. He deposed that the death of Mr. Butler was ocasioned by a gun-shot wound, and produced the bullets or slugs, which he extracted from the wounds. Having asked the deceased if he saw the person who fired at him, his reply was, "That he only saw the flash of the pan—that he was confounded, and felt as if electrified—did not immediately perceive himself wounded, the report having startled his horse, who took to full gallop."

Lynch, the approver, was the next witness examined. He deposed that Mullen, the prisoner at the bar, himself, and two others, were hired by Mr. Fay to shoot Mr. Butler; he was particular in stating that Fay had conferred with him on the business in his own office, and used the precaution of desiring his clerk to retire for the purpose of secrecy—his confederates and he agreed for a certain sum to effect the deed; Mr. Fay himself cast the bullets from leaden spoons, charged the blunderbuss, which he, the evidence, was ordered to use; he took it with him to the place appointed to way-lay the deceased, accompanied by the prisoner and the other confederates. As Mr. Butler approached, he, the witness, laid the blunderbuss down, which the prisoner at the bar instantly took up; they concealed themselves behind a bush, and when Mr. Butler approached near enough to fire at, the prisoner at the bar took aim at him through the bush, and fired. Mr. Butler's horse plunged and galloped forward, on which the rest of his associates and himself (the witness), except Mullen, were determined to follow and despatch him, but the prisoner at the bar cried out in these words, "Let the robber die in pain!"

The bullets were produced to the Court, were examined, and proved to be lead.

The approver Lynch underwent a cross-examination of more than two hours, and, what is extraordinary, his story was so well fabricated, and he came so well prepared, that the slightest deviation did not appear in the course of his testimony.

The prisoner pleaded an alibi, which in his case appeared singularly pointed and consistent.

The overseer of the Royal Canal deposed that the prisoner had been engaged for some time previous to the murder of Mr. Butler, in labouring work at the Royal Canal; that he worked all the day on which the murder was alleged to have been committed until the usual hour, and came to his work on the following morning at the accustomed time.

The witness corroborated his testimony by producing his book, in which the hours of the prisoner's departure from his work, and arrival next morning, were noted.

Another evidence deposed that he was in the habit of sleeping with the prisoner; that he slept with him particularly on the night of the alleged murder, and that the prisoner did not absent himself either on that night, or on any previous or succeeding.

Certain persons gave testimony to the character of the prisoner, which had always been irreproachable, while that of Lynch, the approver, was equally infamous.

The trial lasted until after ten o'clock at night, when the jury retired for a few minutes, and returned a verdict—Not Guilty.

This day Mr. Fay's trial came on, for conspiring the death of Mr. Butler. He was honourably acquitted, no evidence having appeared against him except Lynch.

From the "Dublin Gazette."

SHERIFFS

Appointed by his Excellency the Lord Lieutenant for the year 1794.

County of Antrim.—Roger Moore, of Cloverhill, Esq.
County of Armagh.—John Ogle, of Forkhill, Esq.
County of Cork.—John Wallis, of Westwood, Esq.
County of Cavan.—Thomas Fleming, of Castle Cosby, Esq.
County of Carlow.—Wm. Browne, of Browne's Hill, Esq.
County of Clare.—George Studdart, of Clonderlaw, Esq.
County of Dublin.—St. George O'Kelly, of Newtown Park, Esq.
County of Donegal.—Ralph Babington, of Wartown, Esq.
County of Down.—Hon. Vesey Knox.
County of Fermanagh.—William Tredennick, of Scrabagh, Esq.
County of Galway.—Edw. Martin, of Tulvrea, Esq.
County of Kilkenny.—Richard Alcock, of Kilmurry, Esq.
County of Kildare.—Eyre Powell, of Hilsborough, Esq.
County of Kerry.—Barry Denny, of Tralee Castle, Esq.
King's County.—Robert James Enraght, Esq.
County of Longford.—William Bond, Esq.
County of Limerick.—John Westropp, of Ballysteen, Esq.
County of Leitrim.—Wm. Rowley, of Drumsna, Esq.
County of Louth.—Fr. Manning, of Drakestown, Esq.
County of Mayo.—Martin Kirwan, of Claremount, Esq.
County of Monaghan.—Alexander Kerr, of Newbliss, Esq.
County of Meath.—Thomas Rothwell, of Burfordstown, Esq.
Queen's County.—George Hartpole, of Shrule, Esq.
County of Roscommon.—Gilbert King, of Charlestown, Esq.
County of Sligo.—John Jones, of Johnsport, Esq.
County of Tipperary.—Daniel Minchin Toler, jun., Esq.
County of Tyrone.—John Corry Moutray, of Favor-Royal, Esq.
County of Waterford.—Pierce Power, of Asane, Esq.
County of Wexford.—Wm. P. Pigott, of Slevy, Esq.
County of Westmeath.—Sterne Tighe, of Carrick, Esq.
County of Wicklow.—Charles Stanley Monck, of Charleville, Esq.

KINSALE.

PICTURE OF THE TOWN AS IT WAS ONE HUNDRED AND THIRTY YEARS AGO.

KEY TO THE ABOVE PICTURE.

1. Compass Hill. 2. Salisbury Hulk. 3. The Dock and Yard. 4. Mr. Southwell's House. 5. The Bowling Green. 6. The Custom House Quay. 7. The Market Quay.

The picture of the ancient borough of insale accompanying this article is taken om Smith's History of the Co. Cork econd edition, Dublin, 1774), in which is iven also the following sketch of its story:—

I proceed to a description of Kinsale, hich was called, in Irish, Cean Taile, i.e., e head of the sea, alluding to the pro- ontory, called the Old head; others de- ve it from the Irish cune taile, or cune ille, which imparts a smooth sea or sin. It is, in some old Irish MSS., called Fan-na-Tuabred, i.e., the fall of the springs. This is an ancient corporation. King Edward III. granted it a charter, anno 1333; and the same was renewed by king Edward IV'ths charter of the 22d year of his reign, anno 1482. I do not find that this charter was again renewed, until queen Elizabeth confirmed their privileges, anno 1588, the year of the famous invasion by the Spanish armada. The corporation forfeited this charter upon the Spaniards landing in this town, anno 1600, together with all their privileges. For on October 14, 1601, the burgesses came to Sir George Carew, and requested him to restore their charter, seal, mace, and royal standard; which, upon the arrival of the Spaniards, they had delivered him to keep. The president said he could not return them without directions from England, for he conceived that they were forfeited, but promised to write to the queen in their favour, which he did, and soon after had an order to restore them, on condition that they should, at their own charges, repair their walls, and assist, with labourers,

towards finishing the new fortifications of Castle-Park, all which they promised to perform.

Among other ensigns of royalty restored at this time to the burgesses, there was a fair, large standard, embroidered with the arms of England, given them by king Henry VIII., who sent it by Sir George Carew, the lord president's cousin german, when he arrived at Kinsale (not long before the siege of Bologne), being then admiral of the king's ships. After the restoration of their charter, king James I. gave them £20 per ann. out of the cantreds of Kinsale and Courcey's, to enable them to rebuild their walls. And king Charles I., by letters patent, dated March 13, ann. reg. 14., granted them £6 per ann. out of the lands of Drumdarig, and £12 10s. 0½d. out of the Spittle land. The late king James also gave them a new charter, dated at Dublin, 25th of February 4th regn. before his abdication, and enrolled May 4th, 1688.

In this town was an abbey of regular canons, where (Colgan says) Saint Gobban, a disciple of Saint Ailbe, was abbot in the 7th century. There was also an abbey here of Carmelites, or white friars, dedicated to the Virgin Mary, founded by Robert Fitz-Richard Balrain, anno 1334. Part of the ruins still remain on the N. end of the town.

The parish church is dedicated to a female saint, called Multosia, or St. Multos, by whom it is said to have been erected in the 14th century. From the W. door to the E. end it is 123 feet long, and proportionately broad. On the north side is an arcade of seven gothic arches; the middle arch leads into a cross isle. The steeple of this church is low, old, and but indifferently built. There were in it, about twenty years ago, three bells; at present there is but one.

This town is built under an hill, called Compass-Hill, and extends above an English mile from the barrack, at the north-east end (which is an handsome building for a regiment of men, pleasantly situated) to the World's-end, a place so called on the south-west; a good number of houses are built on the side of this hill, and several also rise near its top, which, from the bay, and the opposite shore, make it look much better than it really is. This hill being of circular form, the place, in a great measure, taking its figure from it. The principal street, for want of room, is, in many places, narrow and incommodious. Over this are the other streets, but the communication is by steep, slippery lanes, which, to strangers, are far from being agreeable. The houses are mostly built in the Spanish fashion, with large balcony windows; that of the Right Hon. Edward Southwell is the largest. Towards the middle of the hill is a pleasant bowling-green; and higher up, a road, planted with trees, called the Mall, where the ladies and gentlemen recreate themselves. There is another walk above this, called the rampart; and a pleasant way quite round Compass-hill, from whence there is a delightful prospect of the harbour, opening into several fine basins, besides the old and new forts, Bandon river, and, one the opposite shore, two well-built villages, called Cove and Scilly. This prospect in time of war is generally embellished with armed vessels and large fleets of merchant ships. The harbour is very commodious, being rendered deep and navigable, by the river Bandon, which empties itself here, and with the advantages of its strong fort makes it much frequented in war time. There are here a dock yard, for the building and repairing his majesty's vessels; also a crane and gun wharf, for landing and shipping heavy artillery, all built during the last war. In war time there is also an hulk for the laying down and careening great ships, besides a store-house, clerk of the cheque, store-keeper, master shipwright, and other proper officers; besides a number of seamen, usually kept in such places in England; and this is the only port in Ireland where his majesty's ships of war can be refitted. In war time, several rich merchant ships, bound to England, often put into this port, and wait for convoy.

The houses set, in war time, for double rent, and their leases are drawn up accordingly.

This town gives title of baron to the Right Hon. John De Courcey, who is lineally descended from Milo de Courcey, son to John, Earl of Ulster, whose ancestors were summoned to the first parliaments of Ireland. The privilege of being covered in the royal presence is enjoyed to this day by his lordship, being granted to his great ancestor, the Earl of Ulster, by King John. The Lords Kinsale were formerly the first barons of Ireland, but are said to have lost their precedency ann. 1489. James, Lord Kinsale, having missed being at a solemn procession at Greenwich, King Henry VII. gave the title of premier baron of Ireland to the Lords Athunry, who have ever since enjoyed the same; but this fact is disputed.

Lower down the bay is the royal fortification of Charles-fort, so called (in honour of King Charles II.) by the Duke of Ormond, anno. 1681, who then came to review it. It was begun in the year 1670, the first stone being laid by the Earl of Orrerey, and was finished at the expense of £73,000.

Before this fortification was built, there was one, on the opposite side, called the Old-fort. The blockhouse still remains, and is capable, if there was occasion to have cannon mounted on its rampart. Both these forts were taken by the Earl of Marlborough, ann. 1691. Sir Richard Booth was the last governor of the Old-fort.

When the Spaniards took Kinsale, it is hard to conceive how they maintained themselves in the place, which (except a rampart on the side of the hill) had very little, besides an old wall, to defend it; there was, to the S. of the town, a small round fort, called the Queen's-fort, which shows what weak fortifications they had in those days; but the army under Lord Mountjoy were scarce more numerous than the Spaniards in the town.

Four miles south of Kinsale, in the Barony of Courceys, is a promontory, running far into the sea, called the Old-head, on which is a lighthouse for the convenience of shipping. A mile from its extremity is an ancient castle of the Lords Kinsale, built from one side of the isthmus to the other, which defended all the land towards the head. This place was formerly called Duncearma, and was an old seat of the Irish kings. The isthmus, by the working of the sea, is quite penetrated through; so that there is a stupendous arch, under which a small boat may pass from one bay to the other. Among the rocks of this coast there are ayries of good hawks; also the sea eagle, or osprey, build their nests and breed in them.

Ringroan is an ancient castle, and small village; it gives also title of baron to the Right Hon. the Lord Kinsale.

POND-LILIES—PAST AND PRESENT.

BY MARGARET M. HALVEY.

When I was a child they were dearer to me
Than blooms of the garden, the hill, or the lea;
Not lifelessly lovely as blossoms they seemed—
They were friends for whose coming I yearned and
and dreamed!
Till a herald breeze whispered: "They wait you
beyond—
The white-lady lilies have come to the pond."

I pictured them ladies, all placid and pale—
On the floor of the waters their white robes a-
trail—
Their golden eys always with welcome a-light,
And 'twas their gentle bidding that speeded the
sprite,
Who bore me the message so lovingly conned:
"The white-lady lilies have come to the pond."

Years sped and I stood on a prosaic shore,
Where the voice of the herald might echo no
more—
For the fays may not stray from the Island of
streams;
Yet sometimes a whisper would steal through my
dreams.
"Acushla," it sighed, "are you lonesome beyond?
Do you miss the white-ladies who wait on the
pond?"
Ah! that same murmur echoed, methinks, in an
ear
Attuned as mine own, fairy whisperings to hear;
For lo! a mere mortal, who knew not the child,
Nor the days, nor the ways where the white-ladies
smiled,
Sends these as a token. 'Midst fern and frond
They nestle as once on the brim of the pond!

By their cheeks' lovely pallor, their eyes' golden
gleams
They are kin to the beauties that people my
dreams;
Oh, would my kind fairy were near me to teach
The soft Celtic magic of welcoming speech;
That sweet were my "Failthes" as now they are
fond,
For sake of the kin on the old Irish pond:
For sake of the days and the ways that are past—
Of the child o'er whose spirit their glamour was
cast—
Of a far Irish home—of a fair Irish scene,
Where the skies bended gray and the hills lifted
green—
Of a young love that chose for its symbol and
bond
The pure, fragile blooms o- the dear Irish pond.

My heart's haven now lies not over the main,
But above—past the breakers of sorrow and pain;
And of Earth's passing boons only this would I
crave—
To rest where the spring breezes croon o'er my
grave,
When her greenest of gowning the old land has
donned,
And her white-lady lilies are thronging the pond.

KNOCKFIERNA.

DISCOVERY OF THE BIRTHPLACE OF FINN M'CUMHAILL

By J. F. LYNCH.

IV.

In the Dinnshenchas of Duiblinn (Dublin), it is stated that Enda loved Aide, daughter of Ochinne, son of Cnucha, and that Dub, who was jealous of Aide, and caused her destruction, was slain by Margen, Ochinne's gillie, by a cast of a feat-apple (uball cliss), from his sling, and that Dublinn means Dub's Pool, and that the ford was named Ath Cliath Margeni, or "hurdle-ford of Margen," and Ath Liag Margin, which is explained "the ford of Margen's flagstone," by Dr. Whitley Stokes; but it is better to explain the name as "the ford of the flagstones of Margen," taking liag to be the genitive plural of liag, "a flagstone."

The ford across the Camoge river, near Knockaine, is, in "Wars G. G." p. 99, named Ath na nech, or ford of the horses, and Ath Cliath na gcomhramh, or hurdle-ford of the victories; both Todd and O'Donovan consider that Ath Cliath na gcomhramh refers to Ath Cliath of Dublin, but this is a mistake. The ford of Knockaine was named Ath Cliath—for instance, compare the passage(a) cited in O'Reilly's Dictionary, p. 259, in which Knockaine is named Druim Collchaille, and the ford is named Ath Cliath, the name of the ford having also become name of the hill. Ath Toradcle—i.e., Ath Cliath Torad, or "hurdle ford of the tower," which O'Donovan identified with Dublin, was a ford (b) at Lough Gur. The Gaill defeated by the Gaedhil at Knockaine sought refuge at Lough Gur, whither they were followed by the Gaedhil, for the people of Lough Gur have preserved a tradition of the terrible battle which was fought at Lough Gur between the Irish and the Danes. They say that the Irish, led by Brian Boroimhe, attacked the Danes early in the morning, and that the battle was fought a little north of Knockfinnel, which was strongly fortified by walls, which are described by FitzGerald ("History of Limerick"), but of which no traces are now left. The battle lasted the whole day, and in the evening the Dalg Cais had possession of Lough Gur. There is a reference to this battle in some historical document, but, strange to say, it is not mentioned in "Wars G. G."

In the Tripartite Life of St, Patrick, the Camoge is named Tir-Glass—that is, river of Tir, or Aradh, (c) for Tir and Aradh are equivalent, and cognate with Latin terra and English earth, and this is the reason why the barony of Owney and Arra is named in Irish Uaithne Tire, for Uaithne Tire, which was the district of the Iberian Muinter Loingsigh, was a portion of Ara, or Aradh, and the names, Iberi and Araid, are merely forms of the same old name, as are also Erin and Iberin, the old names of Ireland.

Beside the ford of Knockaine, there is a row of stepping stones, named Clochan Aine, or "stepping stones of Ane," and the flagstones of Margen were most likely stepping stones to enable foot passengers to cross over the river. At Cloghansoun bridge, a little to the east of Lough Gur, there is a Clochan, and Mr. Bresnan has informed me that he has traced a row of pillar stones from Knockroe, at north-east of Lough Gur, to the old ford.

The name of Oiche, or Oche (compare also Trans Os. Soc., vol. v, p. 273), which I have supposed to be connected with Cnoc Firinne, is an extension of Oc, and Ind Oc—i.e., "the Oc," was the father of Aengus, of Brugh na Boinne, who is termed Oengus mac ind Oc. Professor Rhys ("Hibbert Lectures," p.p. 144-5), says: "The next to be treated is Aengus, who, on the other hand, is never treated as a historical character: he is described as son of the god called Dagda (d) the Great, and the goddess Boann, from whom the river Boyne takes its name. The younger god, fully described, was Aengus, son of the (two) Young Ones. In Irish Oengus mac ind Oc, or merely Mac ind Oc, a name which probably belonged to a lost pedigree of the god, differing from the one ordinarily given. What this exactly meant is not clear." This word Oc has no connection with the word Oc, or Oac—that is, Unc, which is derived from an old Irish word cognate with Welsh ieuanc, Latin juvencus, Sanskrit yuvacas, Anglo-Saxon geong, and English young.

Ochinne, who is made son of Cnucha and master of Maginne, or Mirgen, or Marg, is an extension of Oc, just as Margen or Margine is of Marg, or Marc, and we find another form of the name in Ochaill, who is mentioned in the Dinnshenches of Luimnech, or Lower Shannon, as of Sid Cruachan, in Connaught, and who is stated, by Dr. Whitley Stokes, to occur in the "Cophur in da muccida," ed. Windisch, Irische Texte, 3rd. Series, part i., p.p. 235, et seq. Luimnech, as Dr. Joyce thinks, does not mean "bare little spot," but it is an extended and intensive form of Laoi, or Li, "a river." In the "Dinnshenches of Cnucha, it is stated that she was the daughter of Connadh, from the lands of Luimnech, (e) which is an important statement when we remember the connection of Ochaill with the Luimnech, or Limerick, and the filiation of Ochinne to Cnucha. Ochinne, in the form, Ochaine, is mentioned in a tale quoted by O'Beirne Crowe, from a MSS. of Trinity College, Dublin.

"What is the cause for which the Ulaid killed Cu Roi, son of Daire?" Not difficult. About Blathnait, daughter of Mind, who was brought from the siege of Fer Failge, and about the three Erc Iuchnai, and about the three Fira Ochaine—that is, little birds (f) that used to be on the ears of the cows—that is, the Erc Iuchnai. And a caldron was brought with the cows: it was their calf. And the full of it used to be milked each time from them, while the birds used to be singing for them." One of the Cyclopean forts on Arranmore is named Dun Oichill, or "fort of Ochaill," and on the same island is a fort named Dun Oenguis, or fort of Oengus, who here is said to be son of Ugh mor, but Oengus, son of Ugh mor, must be identical with Oengus, son of Oc. In Perthshire, Scotland, are the Ochil Hills, which have, but I think incorrectly, been supposed to mean high hills, from uchel "high," Cruachan Oigle is old name of Croagh Patrick, and means round hill of Ochil or Ochaill. Edgabail, from whom Knockaine was named Sidh Eogabail, means, I think, "great Eogu," and Eog is most likely a form of Oc, from which came the old Irish name Eochu, which has two genitive forms, Eochaidh and Echach. O'Donovan has explained Eochaidh as horseman, thinking that the word was from ech, "a horse," but this cannot be, for the real nominative case is Eochu. It may render some support to the etymology now given of Eogabal, that the de Danann Eochaidh are connected with Sidh Eogabail, in "Battle of Ventry," and "Pursuit of Diarmuid." Compare also Eochaidh beg of Knockaine in O'Curry's "Manner and Customs."

Professor Rhys ("Hibbert Lectures," p. 590), considers that the names Morc and Marg are equivalent, and he mentions that on the Tain, one of the foes killed by Cuchulaind, was called Marc; and he also equates Morc with Labraidh Loingsech, son of Ailell of Ane, son of Loeguire Lorc, son of Ugaine Mor. Loegaire appears to have been connected with the hill of Knockderk, about a mile south of Lough Gur, which is of old red sandstone formation, and on the hill are three stone circles and a stone chair, and at foot of hill some stone circles and dolmens. The three Loegaires of Red-Stones immediately succeed the three Eochaidhs of Cnoc Aine in lists of de Danann chiefs (Battle of Ventry; Pursuit of Diarmuid). In State Paper, dated 1200, A.D., I think that Knockderk is named Balinacalligi, or place of the caillech, or hag, and the stone chair, (g) which the people name Cathaoir "Baelee," or Chair of "Baelee," must be connected with the caillech. "Baelee" may be a survival of Baile in Baile na Caillich. West of Lough Gur there is a stone circle named Baelee's Drive, and the name is used like a personal name; but yet I think that

(a) In this passage Finn Mac Cumhaill is supposed to be standing on the top of Cnoc Aine. In Mesca Ulad there is a passage which describes Cu Chulaind as standing on top of the hill. The entrance to the Sidh of Eogabal is at south side of hill, and it is marked on present Ordnance Map. An old inhabitant of the district told me that there were a series of stone steps leading from the entrance into the hill.

(b) Probably the ford near Crock Island, by which the old road crossed an arm of the lake. Not far from ford are a small stone circle and a carn.

(c) One of the oldest cities in Chaldæa was named Eridu, and there grew the world-tree sacred to the moon god Ea, or Ai, beneath the spreading branches of which the shepherd, Dumu-zi, was tending his flock when Ishtar fell in love with him. Some years ago Mr. W. C. Borlase said to me that he considered the great mistake made by Irish archæologists was their not looking beyond the Irish horizon; but now we'll strike the harp of Gar, and let free the three terrible war wolves of the Ara race.

(d) Dr. Kuno Meyer (Battle of Ventry), following Cormac (Glossary), considers that Dagda means "good god." It appears to me that Dagda is a genitive form from nominative Dagaid, and that word is from dag, "to shine," which is found in English day, German tag. Dagda was at first a god of light, and is to be equated with the Deagaid of the Iberians of Munster. Ind Oc, Ind Dagda, Nechtan, and Ugh Mor, are made fathers of Oengus. At Lough Gur Nechtan was the husband of Cuil, and at the Boyne husband of Boand, which may mean "white cow." Profess Rhys equates Nechtan with Neptune, to whom the horse and bull were sacred.

(e) The lands of Luimnech probably have reference to Saingil, or Singland, where I think there was a lake. Compare the old pagan ceremony performed on the hills of Saingil ("Wars G. G."). The people say that Gleann na muice duibhe passed beside Singland.

(f) O'Curry ("Lectures," p. 478), quotes an old poem in which these birds are called Eoin Bicc Baile, birds of Little Baile—i.e., Baile Mac Buain, which were regarded in some tales as the kisses of Oengus. These birds are also connected with Clidhna, daughter of Genann ("Silva Gadelica," p. 394). And in "Silva Gadelica," p. 253, we read: "It was Uainebhuidhe (green-yellow) out of the Sidh of Dorn buidhe (yellow fist) from Clidhna's Wave in the South, and with her the birds of the Land of Promise (Tir Tairngiri), Uaine buidhe was Clidhna, and on the Sidh of Dorn buidhe is Lecht Clidhna, a dolmen in a very delapidated state. Dorn buidhe appears to be Clidhna.

(g) There is another stone chair on the hill a little to the west of Knockfinnel, and there was a third in the townland of Grange, a little north of the stone circles. The stone named "Gowlane" by Lenihan ("History of Limerick") was the last stone of the chair. Edward Fitzgerald gave me a description of this chair, which he had from his father. The "Gowlane" (gallan) was taken away some years ago. On Knockadoon is the Suidheachan, or little seat (marked on new Ordnance Map), of the Beantighe, or Housekeeper, who kept house at the bottom of the lake, and when she visited the earth sat upon the Suidheachan, which is a small mound of earth with the top having shape of a seat. On a hill at north-east side of Lough Gur was "red seat" (Suidhe).

"Baelee" can hardly be a survival from the old period.

West of Knockaine was the district of Firmorca, and I think that Knockfierna was in Firmorca, which O'Curry ("Lectures," p. 253), explains "Great men," but which is explained by Professor Rhys ("Hib. Lectures," p. 593), as "equine men," and this is most likely the correct explanation. Moriath was daughter of Scoriath, King of the Firmorca, and after the slaughter of Cobthach, at Dind rig, Labraid Loingsech, taking Craibtine along with him, went to the Stead, where Moriath dwelt, and then he wedded her, and she became his queen of Erin (Dr. Whitley Stokes in "Revue Celtique," vol. xx., No. 4, p. 433). Bruree was named Dun Cobhthaigh, most likely from the same Cobhthach connected with Dind righ, and the stead of the King of the Firmorca may have been on Cnoc Firinne. At the south side of Lough Gur, a little to the east of a large stone grave, (h) named Leabadh Dhiarmada agus Ghrainne, and at foot of the hill of Killalough (Church of the lake), there is a large boulder named Carraig an eithig, "rock of the falsehood," and the people say (i) that Carraig an eithig was cast by Donn from Cnoc Firinne at a giant who lived long ago on the hill of Killalough. It is strange that the rock of the falsehood came from the hill of truth; but the tale is parallel to the story of the feat-apple cast by Marg at Dub. The great leaps and the great casts made by the Celtic giants did not escape the attention of Spenser, and with the following quotation from his veracious chronicle of Briton Kings, I must bring to a close these meanderings from the hill of truth:—

And eke that ample pitt, yet far renowned
For the large leap which Debon did compell
Coulin to make, being eight lugs of ground,
Into the which returning backe he fell:
But those three monstrous stones doe most excell
Which that huge sonne of hideous Albion,
Whose father Hercules in Fraunce did quell,
Great Godmer threw, in fierce contention
At bold Canutus; but of him was slaine anon.

[The End.]

(h) Crofton Croker says that there was an urn found in this grave. The late Edward Fitzgerald, of Lough Gur, remembered Crofton Croker very well, and Edward Fitzgerald told me that his father often spoke of General Vallancey, whom he attended when at Lough Gur; he said that Vallancey took numerous sketches of the monuments, and made most searching enquiries from the people.

(i) The people also say that once upon a time Ane desired to do Donn a good turn, and so she filled her apron with earth, intending to increase the height of Cnoc Firinne, but the strings of the apron broke, and hence Cnoc Droma n-Asail, now named Tory hill, and the lake beside it. On Cromwell hill there is a large cromlech, and the people say that the stones of the cromlech were brought from Kilteely to Cromwell hill, by Grainne, in her apron. In no district of Ireland have so many traditions of Ane been preserved as in Knockaine district. Ane is termed by Cormac, in his Glossary, Mater deorum Hiberniensium. Danu and Ane are the same, and the two forms of the name are connected with the Kerry Paps. Ane is the earth, according to the Lough Gur tales, and her brother, Fer Fi, or Gar, from whom Loch Gair (Lough Gur) was named, was the Sun. Fand or Fann, daughter of Ailill Find and Flidais, and wife of Manannan, and Cu Chulaind, is a form of Ane.

Captain Lawrence, who was recently in command of the Signal Corps of the First Brigade at San Francisco, Cal., has invented a safety shield and signal for the protection of the markers stationed behind the targets at rifle contests. The markers are stationed in a bullet-proof house at the side of the target, where there can be no possibility of injury, but if they should leave this shelter for any purpose whatever, a signal is automatically shown over the face of the target. The signal is operated electrically by the movement of the door of the shelter.

AN ANCIENT IROQUOIS RITE

BY EDWARD HALE BRUSH.

If white men of a Christian nation see a great calamity impending it is customary in public and in private worship to call upon the Almighty for protection. When the so-called "Pagan" Iroquois are apprehensive of trouble of any kind they, in their simple, child-like faith in the power of a Divine Being or his agents, call upon him or them through their peculiar forms or ceremonies to avert the threatened harm. Iroquois annals are full of incidents of this kind. In the ceremonies of the New Year's festival at the Cattaraugus Reservation in Western New York in February, the Senecas of the "pagan" belief revived many ceremonies which had not been observed before in many years, or had not been executed with such faithfulness, and one might say devoutness.

The unusually large attendance of Indians at the dances and other rites of the festival, and the unusual circumspection maintained in connection with the ceremonies, seemed to indicate something akin to that feeling of religious fervour noticeable at a revival meeting among white Christians. The object of this unusual care to carry out the old ceremonies was the pleasing of the Good Creator, Ha-wen-ne-yu, and the subordinate divinities or spirits to whom he is believed to delegate various offices and tasks, such as He-no, who has control of the thunder, the storm, and the rain; the Three Sisters, the spirits whose especial care is the cultivation of vegetables which support life, and the spirits whose care produces the herbs used in healing the sick.

Thanks are given in the Iroquois ritual to all the objects in nature, many of which are enumerated by name. One of the leading features of the New Year's festival is the recitation by the "preacher," or "Master of Rites," as he is sometimes called, of an address or chant of Thanksgiving to the Good Creator, between the clauses or stanzas of which the turtle rattles are played and the feather dance is performed. This dance is the most religious of all the Iroquois dances. Whatever significance its name originally possessed is lost in the dimness of a great antiquity.

In times gone by, this thanksgiving chant and the feather dance were associated with the ceremony of burning the dog. This year on the Cattaraugus Reservation there was at one end of the Long House a curious-looking pole. It was about ten feet high, and was painted around with stripes of red, blue, and green like a barber's pole; near the top hung a small bag or basket and a cluster of ribbons of different colours. When asked what this was, the Indians said in hushed tones that it was "the dog," that is, it had been put there to remind the worshippers of Ha-wen-ne-yu of the ancient rite, which more than twenty years ago was abolished on pressure from the whites, who considered it barbarous and cruel. Neither white men nor red remembered seeing such a thing as this pole in many years.

The false-face ceremonies of the Iroquois were also observed with unusual faithfulness at the recent festival in February. The houses of the faithful were visited by the false-faces; and the false-face dance in the Long House was performed with all the ceremonies appertaining to it, including the burning of tobacco in offering incense to the Great Spirit and supplicating him to ward off the attacks of evil spirits, and including also the ancient ceremony of the scattering of the ashes.

In this ceremony the false-faces seize the ashes and glowing embers from the sacrificial fireplace, and holding them in their hands blow the hot smoke and ashes upon the heads of men and women who are there to be cured of disease by the spirits supposed to reside within the curious masks.

The significance of the decoration of the white dog pole, as described above, is apparent when the history of the white dog sacrifice is considered. It was customary in former times after the animal had been killed by strangling, to deck its body with ribbons of many colours, with feathers and with wampum, and sometimes to paint stripes upon the body also. It was then hung from a pole near the Long House until the hour arrived for taking it within that structure for the sacrifice. In the time of the historian Lewis H. Morgan, the body of the dog was borne to the blazing altar upon a sort of bark litter behind which the people came in Indian file. Speeches and chants were made over the dog, the people joining in the ceremony. Tobacco was burned, as it still is at the New Year's festival; this, as already noted, being the Indian method of burning incense as an offering to the Great Spirit. It is supposed to be an offering especially acceptable to Him and to carry the prayers to His ears.

The white dog sacrifice symbolized in this strangely ornamented pole was a very ancient ceremony, and its original significance is lost in the midst of antiquity, like that of many other Indian rites. At one time the custom of feasting upon its flesh, as that of a sacred animal, was associated with the sacrifice; and the ceremonies of the burning of the dog, as a whole, were anciently so peculiar as to call for especial attention from missionaries and early explorers, who made records of their observations as to the habits of the aborigines. One of the most interesting features of the ceremony is the fact that, while a sacrifice, it does not appear to have had the character of atonement for sin, in this respect being different from the sacrifices offered by the heathen peoples of the Old World and the animal sacrifices of the ancient Hebrews. The ritual connected with the ceremony, some of which survives to the present day, indicates that the chief, if not the whole, significance of the rite was the sending up of the spirit of the dog as a messenger to the Great Spirit to announce continued fidelity in His service and convey gratitude for the blessings of the year. The fidelity of the dog was typical of the fidelity of the Great Spirit's children. He was the trustiest messenger which could be found to bear to the Great Spirit the pledge of their fidelity to His worship.

The wampum, always used in sealing treaties of friendship or any other formal contracts, was hung around his neck as a pledge of good faith. The last time the dog was burned on the Canadian reservation at Brantford, Ont., the Master of Rites sang, "Great Master, behold here all of our people who hold the old faith and intend to abide by it. By means of this dog being burned, we hope to please Thee, and that just as we have decked it with ribbons and wampum, Thou wilt grant favours to us, Thy people. I now place the dog on the fire, that its spirit may find its way to Thee who made it and who made everything, and thus we hope to get blessings from Thee in return."

While the dog hung outside the Long House, where the decorated pole stood this year, its spirit was supposed to linger about the body; but when the dog was placed upon the fire and burned, it ascended to Ha-wen-ne-yu, and conveyed to him the message from His faithful children.

It is a singular fact that though the sacrifice of the dog itself has for many years been abolished on the New York reservations, the ideas associated with the curious rite still retain their hold upon the devotees of the ancient Iroquois religion.

In times past a lake existed in Switzerland near the Marshy Valley, but either dried up or disappeared through drainage or analogous causes. Now several cantons have combined and will fill the ancient lake site by water from mountain torrents now going to waste near by. The head thus obtained will amount to 600 feet, and will afford 60,000 horse-power. The work will take three years to execute and is expected to cost about eight million dollars.

THE FENIAN TRADITIONS;

OR,

SLIABH - NA - M - BAN.

BY JOHN DUNNE.

II.

Amongst all the legends of this locality the peasantry invariably introduce snatches from the ancient poem entitled Ագallaṁ բáṗuiʒ ագuṙ Oiṙin (the dialogue of Patrick and Ossian), which are yet preserved in manuscript, in ancient Irish books, and some of which have been so beautifully translated by the amiable and accomplished Miss Charlotte Brooke, in her "Reliques of Irish Poetry"; but amongst the people the passages referring to the most remarkable natural objects in their own locality have been handed down by oral tradition. History states that Ossian survived the battle of Gabhra, and it is probable that he also outlived the few of his Fenian compeers who had escaped that fatal fight, for there is no more proverbial saying more common in the mouths of the peasantry than "Oiṙin a n-diaiʒ na ṙeinne,"—i.e., "Ossian after the Fenians." Our Irish Homer, as he has been called, doubtless might have lived for some time after the other heroes of his day, but how he and the Irish apostle could have been contemporaries, is a mystery to me. It throws no obstacle, however, in the way of our local seannchaidhes' faith, for they have no difficulty in elucidating the matter by the tradition which I here recount, as it has often been repeated in my presence.

The Fenians were one day in pursuit of a stately elk, which, after a long chase, their hounds succeeded in killing; but scarcely had it fallen, when a dense heavy fog enveloped the landscape all round. A sudden gleam of bright sunshine, however, divided the dark fog, unfolding to their astonished gaze a venerable old man with long beard and silvery hair. Surveying for a few moments, with apparent concern, the "antlered monarch of the woods" expiring in the thicket where it had fallen, he lifted the carcase with much ease, and throwing it across his shoulders, walked away as if unincumbered by any burthen. The Fenians, hungry and fatigued after the day's chase, and ashamed and provoked at the idea of losing their quarry so easily and unceremoniously, followed with hasty strides after this mysterious personage, but to their surprise they always found themselves the same distance behind the object of their pursuit, no matter how they might increase their speed. Many an intricate copse and deep entangled glen did they force their way through in the pursuit, till at length they beheld at the further end of a narrow glade, the aged man enter a low moss-covered hut, which, on approaching, they found to be a most delightfully situated retreat. They followed into the house; but it is unnecessary to detail in full the incidents of their interview with the supernatural occupant; suffice it to say, that they received a welcome, were plenteously regaled, and wondered very much at the strange things which they saw, and at the words of wisdom which fell during the evening from their mysterious host, who at their departure in the morning, offered to bestow on each the gift of his own choice. It was then that Diarmuad obtained the ball-seare, that being the request which he made. Each of the others, was similarly granted his individual wish, all being somewhat similar; but, last of all, Ossian's turn came to state his choice, and he asked for "ʒṁára 'ṙ ṫṁócaiṁe," i.e., "grace and mercy." The sage congratulated Ossian on the wisdom of his choice, and expressed his regret that all the others had not made an equally sensible request. After this he bade them a long farewell. On their way, the Fenians pondered deeply on the strange adventure that they had met with, but time passed on, wearing away these impressions. Fionn fell in an engagement at Rathbrea, on the banks of the Boyne, A.D. 294, or 284, according to the Annals of Tighernach; and his valiant hosts were annihilated some years after at the famous battle of Gabhra; Ossian survived this battle, as before stated, and was subsequently conveyed by some invisible power to Tirna-n-og—"the land of youth," and the Elysium of the Pagan Irish—whence, after a long lapse of time, and many urgent entreaties, he was permitted to visit once more the favourite scenes of his mortal feats, his manly sports, and exercises whilst on earth. But forgetting a certain prescribed precaution on his return to the isle of his birth, he lost the health and vigour he had enjoyed in the land of youth, and was suddenly metamorphosed into an old man, worn down by the infirmities of two hundred years. So saith the legend, which further adds that this happened to be the period of St. Patrick's mission in Ireland, and meeting with Ossian in his sacred journeys, the saint, actuated by feelings of compassion for the great age and infirmities of the hero, took him under his protection, with the determination of converting him; but he found him an obstinate Pagan. Ossian, according to the traditions, could not relish the fasting fare and rigorous austerity of the saint and his followers, and disliked very much to be disturbed early in the morning by the noise of bells and the chanting of matins, always preferring to the harmony of their sweetest psalms, the melody of the birds in some romantic valley, or the wild and discordant music of hounds, deer, and horns, to which he has been so long accustomed. His lamentations for his departed heroes and for his own forlorn state, left on earth behind them, are very affecting, as given in the Irish MSS., or preserved orally amongst the people; and the panegyrics, ascribed to him, on their generosity, their valour, and other virtues, whoever may have written them, are beautiful in the extreme as poetical compositions. After many long disputations, Ossian renounced Paganism; but for a long time before his conversion St. Patrick found it necessary occasionally to draw him away from polemical discussions, when the violence of his temper appeared too likely to become roused; and this was ingeniously accomplished by asking him to narrate some of the heroic exploits of his father, himself, and brother Fenians, in the time of their glory. This stratagem at once calmed the storm of Ossian's anger, and his tales are the subject of the poems before alluded to, which are decidedly of very ancient composition. The allusions to Sliabh-na-m-ban and various places in its vicinity, with which the poems abound, are very numerous. Many are, doubtless, familiar with the ancient manuscripts which contain them in the Libraries of the Royal Irish Academy, and Trinity College, Dublin, or at least with more modern transcripts, which are numerous enough; but it may be interesting to note to those who do not understand the Irish language, that a short passage from one, with a translation, should be supplied here as an example:—

P. A Oiṙín iṙ binn liom do ġlór,
'S beannaċt fóṙ le hanmuin fhínn;
Aiṫṁiṙ dam cá ṁéad fiaḋ
Do ċuiṫ liḃ aṁ Śliaḃ na m-ban bṙionn?

O. Do ṙgaoileamaiṁ amaċ mile cú
Do b'ḟeaṙṙ lúiṫ 'ṙ do bí ġaṙġ;
Do ċuiṫ ḋá fiaḋ le ġaċ coin díoḃ
Sul do cuiṫeaḋ ialla na haṙġ.

Do ṙgaoileaḋ amaċ cú beaġ eile,
Ba leóṁ a ṫṁéine iṙ a cṁinne;
Do ċuiṫ lé ṁin ḋá fiaḋ
'S an oiṫeaḋ leiṙ an bṙinn uile.

Dá ċoin déaġ an Śliaḃ Luaċṙa,
Dá ċoin ṁóṁa a mBeaṙna an ṙgalla,
Dá ċoin a n-iaṫċaṙ an Ṙóṁaiṁ,
'S dá ċoin a n-aḋainn Danna.

Dá ċoin a ġCaiṙġín na ġcloċ,
'S dá ċoin a loċ Innṙe Ui Chuinn,
Dá ċoin a bṙoṁaoil na bṙiaṅ
'S dá ċoin aṁ Śliaḃ-na-m-ban-bṙionn.

ST. PATRICK.

Melodious, Ossian, is thy voice to me,
And a blessing yet be to the soul of Fionn;
To me now tell, how many stately deer
Fell in the chase of Sliabh-na-m-ban-fionn?

OSSIAN.

We from its cliffs a thousand hounds let loose—
Unmatched in speed were they, and fierce and strong;
Two stalwarth deer fell 'neath each dauntless hound,
Ere leashed in pack, by pliant leather thong.

And we let out another little hound—
All life was he, all perils to withstand,
Two noble deer fell victims to his fangs,
And many as the sporting Fenian band.

Twelve hounds did lurk on Sliabh Luachra's rushy breast,
And to Bearna an sgalla, two large ones ran—
Two watch'd the prey down westward of the Rower,
In measured springs two sought the silver Bann.

Two hounds took post, on rocky Carrigeen;
Another pair at Inchiquin's clear lake;
Two outstripp'd the dashing Fenian van;
And two crouch'd down in Sliabh-na-m-ban's thick brake.

My attempt at a metrical translation is very rude, indeed, but it is faithful. It is interesting to trace the localities alluded to in the above stanzas. The Bearna an sgalla (a) here mentioned is the famous Scallough Gap, a mountain pass on the confines of Carlow and Wexford. The Bann referred to is the river of that name in the county of Wexford, and not the Bann in Ulster. The name Ṙóṁaiṁ I have translated Rower, as there can be no doubt the district of that name between Brandon Hill and Ross is referred to. There is a rocky eminence on one of the Sliabh-na-m-bann hills named Carrigin-na-g-cloch, which is evidently the "rocky Carrigeen" mentioned. Sliabh Luachra is a mountain on the borders of the counties of Limerick and Kerry, but there was also a hill of the name in the ancient Ossory, and it is strange to find such distant localities as this and the lake of Inchi-

(a) We are indebted to Dr. O'Donovan for this reading: Mr. Dunne's MS. has Beaṙnaiṁ Sgail, Bearna an sgalla means "the gap of scalding"—so termed from the many conflicts which occurred there.

quin coupled with places in Kilkenny, Tipperary, and Wexford.

In the following stanza, from the same poem, one of our local rivers is also referred to:—

Dá gabadh deag do bí ag Fiann,
'Nuair do léigeadh iad fá'n gleann 'na fiadh;
Ba binne a nglam ná aoibne ceoil,
'Sa n-agaidh ó'n t-Suir amach.

Twelve dogs that Fionn had,
When let down the glen in full speed,
Sweeter their baying than the sweetest music,
And their face from the Suir out.—

It need hardly be observed that the summit of Sliabh-na-m-ban commands a magnificent prospect of the valley of the Suir.

In another part I find Drom-Derg, the old Irish name of Killamery hill, alluded to thus:—

Mian mic Cumhail ba maith gnoas,
Eisteacht le fiadh Dromma Deirg.

'Twas Mac Cumhail's delight, with cheerful brow
To listen to the deer of Drom Derg.

The same hill is also mentioned in the poem entitled "Laoidh Aircion":—

Dearmad fleidhe do finn Fionn,
A nalmuin re linn na laoch
Ar dir do'n bfeinn o Dhrom Deirg,
Fáth ar eigidh a breaig 'sa bruach.

Fionn forgot inviting to a feast
In Almhiunn, in the days of the heroes,
Two of the Fians from Drom Derg,
For which arose their anger and their ire.

Before leaving the subject of Ossian's alleged sojourn with the patron saint of Ireland at the Rock of Cashel, long after all his compeers were consigned to the tomb, I shall relate a very curious legend, and one which, though having particular reference to the locality under consideration, is a popular favourite throughout the greater portion of the south of Ireland.

(To be continued.)

ONE RIVER ALWAYS PEACEFUL.

In all the reports of storm and flood, disaster and death, there is one great river—the outlet of Lake Umbagog, which debouches from the lake about forty miles and a trifle east of north of Mount Washington in New Hampshire, like the Nile from Albert Nyanza, a river of sufficient depth and breadth to float the steamers that ply in summer on the lake—that is seldom heard from. The Androscoggin in all the trouble and tumult continues to flow on unvexed to the sea, carrying blessings without number to the land and people, the cattle on a thousand hills, birds of the air and creeping things.

The region of this river is not exempt from conditions prevailing elsewhere. The Connecticut River, on the other side of the State and at the lakes but twenty miles away, is doing its share in the way of dams carried away, farms and towns inundated, and ice gorges, fetching death and destruction in their course.

Why, every one will ask, is the Androscoggin peaceful when all others are disturbed; harmless when others are bent on devastation The answer is easy. A plain man, now deceased, Coe by name, and with a great head for business, who owned saw mills on the river, had the wisdom to spend thousands in order to save millions, holding the flood water back when it would do only harm and having it for use during the long summer, when it would do good only. He dammed the Androscoggin at its principal sources. These dams form three great lakes in the wilderness, covering the divide between the waters flowing through New England and those flowing into the St. Lawrence, which holds back the flood until the storm is past.

Thus one wise man did at his own expense for the people of two States, what great so-called commonwealths have not had the wisdom or enterprise to do.

OUR WEEKLY STORY

A CHILD'S WOE.

BY ETHEL GODDARD.

Babs Wrexham was aggrieved. Irritation was apparent in her round, delicately-tinted little face, her brown eyes—even, indeed, in the pose of the dark curly head, which turned all too often towards the window beyond which lay many delights, and all too seldom towards father, who was reading the "portion of scripture appointed for the day" in a voice of reverent melancholy. Babs was only six, and her soul loathed morning prayers, especially morning prayers in summer, because then there were so many happy free outdoor things which seemed to call to her and taunt her with being a prisoner. It was on a wonderfully fresh and sweet summer morning that Babs rose to such a height of irritation and nursed such angry feelings against solemn, sonorous father, and even against gentle, fair-haired, blue-eyed mother—not that Babs was by any means a bad little girl, but she was only six, and summers were still a fairy-like novelty.

Babs was worried that day as well as being restless, for the first great excitement of her baby life was filling her mind. Johnnie Lascelles, her pet playfellow, so strong, so brave, so wise—having well learned all that eight years could teach—had fallen from a tree, and with bated breath the children whispered together of their comrade's fate; he could never walk again. The awful possibilities of life under such a calamity gripped Bab's heart as she sat in the window seat, gazing abstractedly at the flitting butterflies and the little lambs which she always longed to pat. Never to walk—why that meant never to run, never to climb, and Johnnie had been learning to swim, whilst his riding had been the admiration of all his peers. Bab's brown eyes grew stormy; her comrade could not live if he could not walk. She clenched her hot hands fiercely, the humming of bees, the singing of birds, and the soft swish-swish of the trees ceased to make her long for freedom, the thought of Johnnie had killed all other thoughts. Johnnie a cripple until he should die. Suddenly father's sonorous tones caught Bab's wandering attention. He was reading of the signs which "shall follow them that believe," and Babs listened with wondering interest to the words which were very new and strange to her. "They shall lay hands on the sick, and they shall recover." Babs sat up stiffly, her brows puckered. These words were not merely strange and fairy-like, they bore on the present state of things, they bore on Johnnie's calamity.

All through the weary day of prosaic nursery life those words rang in Babs's ears. Play had become a burden, tea under the trees was a weariness. Babs counted the minutes until she should be able to make her escape to Johnnie.

It was not till the cool evening came that the little figur garbed in brown holland, and almost extinguished by a big mushroom hat, stood before Mrs. Lascelles, panting after a hurried run across the fields.

"May I, please—may I see Johnnie?" The voice was very eager, the brown eyes looked appealing. "I'll be very, very quiet."

"Really quiet, Babs—promise now."

"Weally quiet. I'll do Johnnie such good."

Mrs. Lascelles' eyes filled with tears at Babs' hopeful words.

"Run up, then, dearie, and mind you go away when Nursie tells you."

Babs scampered joyfully up the stairs, but her face grew very solemn as she walked on tiptoe up to her friend's bedside, for somehow the strong, gay Johnnie seemed a long way off, and quite alien to Johnnie with the fretful eyes and the husky voice which said "Well, Babs, old girl," with a ghastly affectation of the bravery of better days, which chilled his eager little comrade, and seemed to drive hope out of her heart.

"I'll leave ye with Master Johnnie, missie, an' maybe ye'll cheer him a bit," Nurse's voice broke in upon the storm in Babs's heart, and then she found herself alone with the wreck of her joyous playmate. For a moment Babs was silent, checked by the piteousness of Johnnie's thin, white face and puckered forehead; then, clenching her hands, she seemed to nerve herself for an effort, the struggle showing in her brown, solemn eyes, which gazed almost sternly at Johnnie. At last she spoke, straining on tiptoe in her eagerness, and clutching Johnnie's shoulder:

"Get up, Johnnie, get up; I believe you can get up!" Babs's face grew red from the tremendous effort. She waited a moment. Johnnie spoke querulously, incredulously:

"You what! You think I'm shamming! B—Babs, you're a little b—beast!" The suffering blue eyes were full of tears. Something stabbed Babs's heart, for in no tribulation had Johnnie ever been known to cry. But again the little hand clutched Johnnie's shoulder. The spirit of martyrs was come upon Babs, and, despite her friend's scorn and cruelty, she would save him—he should walk again.

"I believe you can walk—I believe you can walk! Walk round the room, Johnnie—now, now!"

Johnnie's mouth trembled; he looked deprecatingly at the flushed little face which seemed to him so cruel; he misread the bright eyes, and believed them full of mischief.

"Oh, you c—cad, you pig!" he ejaculated, and at last the great tears forced themselves down his cheeks. Babs gulped; he did not seem to understand her, but she would try once more, though it was hard when the tears rolled down her hero's face.

"I've laid my hands on you, I believe you can walk, get up, do get up, Johnnie." In her anxiety to impress belief, both on herself and Johnnie, Babs raised her voice almost to a shout. In a moment nurse came in.

"I'm ashamed of ye, missie, terrifyin' the poor lamb; leave the nursery at once, ye bold child." The voice brought comfort to Johnnie the tortured, whose whole being was shaken by sobs.

"S-she says I c-can get up," he moaned. "T-take her away."

Babs glanced despairingly from nurse to Johnnie. They were both against her, and she had meant so well. With a painful tightness of the throat and smarting in the eyes Babs left the nursery, lacerated in her soul by a sense of disgrace, a knowledge of defeat, and a sickening thought that there was a mistake somewhere. Just outside the door stood Johnnie's mother, and it seemed to Babs that all the world was her enemy, for there, too, stood her own father with judgment in his eyes.

"Why, Babs, what is this?" asked Mrs. Lascelles, "you promised to be good, and yet we heard your voice when we were at the hall door."

"Yes, what is the meaning of it, Babs?" came father's coldly spoken question.

In the doorway stood nurse, intent on telling her side of the story. Babs choked, and was silent. Not before father and nurse would she break down, but an aching longing for mother came into her heart.

Nurse spoke—"She's been tellin' that poor lamb, sir, that he can get up if he likes, an' he lyin' waitin' for the surgeon; an' she's made him cry somethin' awful, sir."

Father's strong, cool hand gripped Babs's little hot paw. "Come home at once, you naughty girl," he said. He, too, was deceived by the brightness of Babs's eyes, and thought it meant mischief. As they walked through the fields Babs gulped and blinked, while Mr. Wrexham wondered crossly how any child

could be so hard of heart. "What did you do it for?" he asked at last.

"I w-wanted to make Johnnie well."

"A nice way to do it. Why, any baby" (Mr. Wrexham looked indignantly at the small brown figure) "any baby would know better."

"It w-was what you read out this morning, and I p-put my hand on Johnnie, an' b-believed just like that." Babs looked up with tear-filled eyes, and longed to be understood.

"Tut, nonsense, child; that was not intended for children, and you were told to be quiet, so you were disobedient, and to bed you are to go directly."

To bed! To pull down the blinds in broad daylight, to shut out the sun when bed-time was still an hour distant, and to let the boys know of the disgrace. Babs's heart seemed to break as she thought of the three young brothers who would sit in the seat of the scornful. Just then they met mother, and hope came to Babs again.

"Ah! Margaret," said Mr. Wrexham, "I am glad to meet you. Babs has been a very bad child, has made Johnnie cry—the very worst thing for him—she is to go to bed at once, please."

When they were alone together mother looked down wonderingly at the little brown figure.

"What is this, Babs?" she asked. Two big tears welling up and splashing over were the answer. Babs felt herself caught up in mother's arms and carried away, she cared not whither, such was her joy at meeting sympathy at last.

Apathetically Babs allowed herself to be divested of the mushroom hat, and the crumpled brown frock, and even at last to be tucked into her cool cot.

"Now, Babs," said mother, "tell me what is wrong."

A big sob wrenched itself out of Babs's self-control, tears fell in a shower, blurring the round brown eyes; out of the tempest came Babs's little quivering voice. "It w-was what daddie read this morning all 'bout what Gentle Jesus said, an' I w-wanted to make Johnnie well, and I believed so hard, mummie, an' daddie says it is all nonsense—an' gentle Jesus said it, but Johnnie w-wouldn't get up an' walk about."

Mother's arms were round her poor, storm-tossed baby, and as she laid her head on that restful shoulder Babs felt that she had a friend in the world. Mother's forehead was puckered, her eyes seemed strangely dim, considering the tradition that grown-ups never cry.

"Babs, dearie," she said, speaking with difficulty, "listen. Gentle Jesus said that to men and women, not to little chicks, who are too small to be able to do those things."

"B-but Johnnie hates me now, and I wanted to m-make him well. An' nurse an' daddie is angry wiv me, an', oh, why didn't Gentle Jesus say he wasn't sayin' it for little girls?"

A stormy figure was Babs as she sat up in bed, her dark hair tangled, her face blotched from tears, the baby eyes cloudy, angry. Mrs. Wrexham was puzzled.

"Dearie," she said, stroking the little hot cheek gently, "I'll go over now and tell Mrs. Lascelles all about how it was, and then Johnnie will not be angry any more. I'll speak to daddie, too, and then everything will be all right. Now you must not talk or cry any more, but just go sound asleep, if you are my good girlie, and then we will have a long talk to-morrow about this trouble."

Babs, left alone in the darkness, gulped down many sobs, and blinked away many tears, so that she might be mother's "good girlie," and at last she fell asleep, with piteous shivering sighs. In the morning Babs did not come to prayers, for baby troubles bring long sleep, and just at the time when father and mother were wont to sit down to breakfast she trudged soberly out into the sunshine to join "the boys" in constructing a large mud pie, to be made from clay moistened from a watering can used religiously turn about.

Babs's mother was in the breakfast room, and her mind was full of the baby tragedy of the night before. Babs's father came hurriedly through the French window, bringing an atmosphere of practicality with him.

"The London specialist has operated on that little chap, Margaret," he said. "It's all right now; he'll be as well as ever soon."

Mrs. Wrexham looked at her husband with joy lighted eyes.

"Can he walk—can Johnnie walk?"

"Yes, surely. I tell you he'll be as well as ever soon."

"Oh, I must tell Babs; this will set everything right for her!"

"Now, Margaret, don't fill the child's head"—but Babs's mother had gone.

"Babs! Babs!" she called. Babs looked solemnly up from the mudpie; in her eyes was a child's shamed consciousness of a past breaking down of the barriers.

"Is it me, Mummie?"

"Us too?" shouted the boys.

"No, only Babs. Come, dearie."

Slowly, shyly, Babs walked over. Her head was still full of yesterday's agony, though she felt vaguely that she must put it away.

"I have good news for you, Babs"; Mother's voice was very happy. "Johnnie can walk; he will soon be quite well and able to play with you again."

"Weally, truly, Mummie?" The voice was tremulously eager, the brown eyes were bright once more. Babs paused, then she spoke again joyfully: "An', Mummie, Gentle Jesus meant it all, an' Daddie was wrong! Give me a kiss, Mummie, 'cause I wasn't bad, an' 'cause Gentle Jesus meant it."

Mother breathed a prayer of thankfulness when Babs ran triumphantly back to the mudpie that the little feet had touched earth again, and that her baby's hands were brown and soiled from a childish play.

SAND PILLARS.

Travellers in the celebrated Death Valley of California have described the wonderful contortions of the sand pillars that small whirlwinds sometimes send spinning across the hot plain. Even more remarkable are the "dust devils" seen by H. F. Witherby, the English explorer, in the valley of the White Nile. Sometimes two of these whirling columns, gyrating in opposite directions, meet, "and if they be well matched the collision stops them and a struggle ensues as to which way they shall twist. Gradually one gains the mastery, and the two combined begin to gyrate alike and then rush on together." Some of these whirls will strip the clothes from an Arab's back, or twist a goat round and round like a top.

ANCIENT CITY IN MEXICO.

Leopold Batres, Conservator of Archæological monuments in Mexico, has exhumed an ancient city of the Zapotecas, in the State of Oaxaca. In its centre is a grand plaza, and rising to the north of the plaza are terraces, on which are founded two great temples, while in the centre of the plaza itself are two massive mausoleums, in which the priests of the temples were buried. On opposite sides of the public square there are also twelve smaller shrines, six on either hand, all supported by heavy columns of basalt, covered with hieroglyphic inscriptions in bas-relief. In the temples the history of the people was found inscribed, in the language of the Zapotecas, upon fifty tablets of stone. So much of the surprisingly rare historic import has already been found that Mr. Batres will ask the government for more men to be put at the work of exhuming and restoring the buildings of the long-buried city.

Close beside the head of Tiberius a Cupid of white marble was found, the whiteness of the cleavage having lost none of its original purity. The fracture shows a clean, granular, and shining white. It is to be regretted that the statuette has lost its head, the left arm, the right forearm, the left leg, and the right foot. Both finds have been temporarily deposited in the Opera Pia di San Paolo, but will doubtless be presented to the Turin Museum of Antiquities, which contains many valuable relics.

NOTES AND QUERIES.

THE BOOK OF MacCARTHY REAGH.

Could any of your readers say what has now become of the "Book of MacCarthy Reagh," of which the following abridged account is taken from an article on this book, by the famous Cork antiquary, John Windels, published in an early volume of the "Kilkenny Arch.-Journal," at which time, about 1854, the said "Book of MacCarthy Reigh" was in the possession of a Mr Thomas Hewitt, of Cork:—"The 'Book of MacCarthy Reagh,' writes Windels, is a large vellum manuscript, discovered about half a century since (i.e., about the beginning of the ninteenth century), it is said, in a recess of one of the chambers in Lismore Castle, a recess which had long been walled up. Soon after this the MS. found its way into Cork, where it remained for some years, and many transcripts were made from it by the local scribes, who were then rather numerous. On its return to Lismore the volume was considerably reduced in bulk, portions of it having been abstracted, or altogether lost. Of the first 43 folios there is at present (i.e., 1854), no trace, whilst the part now in Cork, consisting of 66 folios, supplies the other missing portions. After the year 1813 the Cork part passed, by death, from the hands of its original holder, to those of a third party, with whom it remained till Dec, 1853, when it was purchased by Mr Hewitt. In May, 1840, Mr Eugene Curry completed for the Royal Irish Academy a facsimile of the Lismore volume, retained at Lismore, and now known as the 'Book of Lismore.' The Cork volume on 'Book of MacCarthy Reagh' consists of 66 membranes, numbered by folios, each page written in double columns. It contains 57 articles, two of which are imperfect—viz, the Life of St Finchua, and the Forbuis Dromdamhgaire, whose missing portions are supplied by the 'Book of Lismore.' There are in it but few titles or headings, and the distinctions of the various pieces are indicated merely by large-size initial letters, of which some are elaborately wrought with interlaced ornaments. The penmanship is, in general, admirable, large words and prim, and the abbreviations few. Dr Todd found that the writing was exactly similar to that of the 'Book of Fermoy,' written in 1487, and considered both volumes as probably the work of the same scribe. Its age is however ascertained by the same hand as the rest of the MS, made at folio 134, where it is recorded that Angus O'Calladh wrote this for MacCarthy—viz, Fingian MacDiarmod, and a blessing on him. This personage was no other than Fineen MacCarthy Reagh, or Riabhach, who died in 1505, and was the son of Diarmod, Prince of Carbery, county Cork. The contents of the volume, which was probably taken to Lismore Castle, whilst he latter formed the residence of the Bishop of that See (now joined to Waterford), are quite diversified, consisting of hagiology, topography, romance, and legend, poetry, and history. The hagiology comprises: 1. The Life of St Finchua, of Bregsni, near Mitchelstown. 2. The Life of St Brendan, the Navigator. 3. The Life of St Ciaran, of Clonmacnoise, and 4. The Life of St Mochua, of Balla, county Mayo. To these are to be added a number oflegends of St Patrick, St Columbkille, St Mochuda, of Lismore, etc. The topographical information in every portion of this volume cannot be over-estimated. A tractate on the Two Fermoys is almost unique, and is evidently a composition of the pre-English period. In the 'Agallamh' or Dialogue of Caoilte-Oisin and Fincadh is embodied a vast amount of the topography of Ireland, giving the derivation and origin of remarkable places, mountains, valleys, lakes, rivers, etc. At folio 140 is the 'Book of Rights,' which differs slightly from the version of it published by Dr O'Donovan for the Celtic Society. Article 52 is the 'Imthcacht Na Tromhe Daimhe,' or the Adventure of the Bards. The Forhics Dromdamhgaire is an historical chapter on this encampment at Knocklong, county Tipperary, following which is a tract detailing the visit of the King, Bishop Cormac MacCullinan to Cleann Claire, a mountain east of Knocklong. Next occurs an account of the revolt of the serfs of Ireland in the reign of Fiacha Finn Fhola, and the massacre of the natives, king, and princes. The historical pieces in this Book are heavily overladen with fact and fiction; whilst the purely legendary portion is particularly rich in invention and fancy."

EVOC.

LORD LOUTH IN NEWGATE.

A LAST CENTURY CARICATURE.

We reproduce this week another of the caricatures from Watty Cox's "Irish Magazine," 1811—that in which Lord Louth, who had got himself committed to Newgate for "subornation of perjury, for hiring another wretch to swear against an industrious poor man, father of a large family, for cutting down a tree that never grew in his lordship's demesne, nor in any other demesne, nor in any land or water, stone quarry or limekiln in the universe"—is depicted in his cell in Newgate. The caricature appeared in the October number of Cox's publication, and in the letter-press accompanying, his lordship is described as "Amusing himself in his chamber in Newgate, with some culinary experiments preparatory to his Dinner. Our readers may be assured the likeness of the noble Baron is strictly preserved by the artist, as we spare no expense on such occasions, to keep up the character of our print, to which the future Historian of Newgate or the Biographer of the house of Plunket may resort for the best and most faithful materials, and from the most authentic sources." The article gives a supposititious account of his lordship's departure from the jail on 1st September, 1811, when his three months' sentence expired. In an earlier number—that for August—the following account of how his lordship spent his time in Newgate was given:—

Every part of a great man's life must be interesting to the inquiring part of the community. Lord Louth's manner of disposing of the tedious hours in Newgate is not devoid of interest. If our time could allow us to pay such attention to the subject as it so eminently deserves, we could produce a very handsome course of regimen and amusement that must be useful on future occasions to noble convicts. His Lordship rises about nine each morning, breakfasts at ten, and has his ROLL-CALL at eleven. The reader is not to understand by "Roll-Call" that his Lordship has any military situation. The words only have a literal meaning in his Lordship's present manner of living; his "Roll-Call" is a regulation adopted in the management of his household, since Mathews and Judge Day sent him to Newgate. His Lordship discovered, before he was three days in his Green-street residence, that the bread he left after breakfast was not allowed to remain on the side-board as it should be, for a future occasion, but had been illegally removed by his valet, a wily Frenchman, who though allowed ample board wages, converted the broken "du pain" to his own use. To avoid a recurrence of such a heavy misfortune, his Lordship counts his bread every day, and as it is formed into "Rolls," the servants have appropriately given this part of his Lordship's business the name of ROLL-CALL. After Roll-Call, his Lordship retires to his study, which is the wide seat of the farther window, and there he reads for two or three hours, except when interrupted by visitors, or by the noisy voice of an obstreperous fruit woman, who continues inviting his Lordship, by name, to become her customer. The principal part of his literary recreation is taken from Saunder's News-Letter, which his Lordship prefers to any other book or paper, as it affords a greater variety of reading, particularly suited to his taste for rural economy; sales of lands and "trees"; anecdotes of jails, lazarettos, and butter-milk churns, articles heretofore in great estimation at Louth Hall. For this entertaining amusement he pays one penny a day to a blind stationer, who spends the hours he waits on his Lordship, playing on a Jew's Harp at the kitchen fire.

Four is Levee hour; several of the visitors stay for dinner. The Earl of Fingal, Mr. Pollock, Colonels Cuffe, Marlay, Plunket, and Caulfield, with Lord Gosford, Counsellor O'Casey, Rev. Mr. Eustace, Rev. Mr. Lees, and Lord Tyrawley, are amongst the most attentive of his Lordship's friends, who kindly assist to mitigate the dulness of an irksome confinement.
